In the Peace of Riga, which followed on Oct. 12, 1920, the terms obtained by the Poles were surprisingly favorable. The eastern boundary was fixed far beyond the line recommended by the Peace Conference in 1919 and contained the cities of Pinsk, Kovel, and Rovno, an indemnity was to be paid Poland; the Galician line was recognized; Lithuania was to be cut off from Russia, by a narrow arm of Polish territory extending north as far as Latvia. The treaty brought to a head another difficulty in which Poland was involved. During 1920 there had been some fighting between Poles and Lithuanians over the disposition of Vilna and the Suwalki region southwest of Vilna. The evacuation of Vilna by the Bolsheviks during the course of their retreat east in August, and the terms of the Riga Treaty, intensified the struggle with the result that, on October 9, General Zeligowski appeared in the city with an irregular military force, and, though unauthorized by the Polish government, drove out the Lithuanians and claimed the section for Poland.

Settlement by means of a plebiscite under League supervision was proposed, then abandoned, by the League of Nations, but, thanks in part to pressure from the League, Zeligowski withdrew from Vilna and elections for the local Diet were held in the disputed district in January, 1922. The Diet immediately voted for union with Poland, in February, whereupon the Polish Parliament resolved (March 24) to annex Vilna, and the formal incorporation of the district into Poland occurred on April 18. The Allied Council of Ambassadors acquiesced in a *fait accompli*, and in March, 1923, fixed the northeastern frontiers of Poland in such a manner as to include Vilna, despite vehement Lithuanian protests. Thereafter, however, Poland and Lithuania continued to show bitter feelings over the division of a "neutral zone" which had been established between the two countries. (See LITHUANIA.) Danzig, too, was a seat of trouble. Not content with the treaty provisions made for the Free City, Poland continued to agitate for a greater Polish control and in November, 1920, Paderewski, before the League Council, sought the right to police the city with Polish military. This demand was occasioned by the unfriendly attitude toward Poles in Danzig, but more particularly by the fact that munitions for Poland, during the Russian War, had been held up by the port authorities. Not until Oct. 25, 1921, did Poland consent to sign an agreement with Danzig and accept the Allied terms. (See DANZIG.) Much more serious was the conflict with Germany over the division of Upper Silesia.

It is thus evident how stormy was the early career of Poland. The consideration of the new constitution necessarily languished and it was not until Mar. 17, 1921, that the document was finally completed. It provided for a bicameral Parliament (Sejm), a responsible ministry, and the President, elected for seven years by the Parliament. Roman Catholicism was made the state religion, though all other faiths were given freedom of worship. Labor was officially recognized. State insurance against unemployment, illness, and accidents was promised. A section modeled after the German constitution provided for the erection of local economic organizations, to centre eventually in the Supreme Economic Chamber of the republic. The conduct of foreign affairs and the increasing economic instability were responsible for the frequent political crises.

Paderewski fell from power Dec. 7, 1919, and 1920 saw two different cabinets. Radical disorders in Warsaw and Galicia and the continual turbulence of the Socialist and Workmen's members in the Assembly added to the general uneasiness. In 1921, the war ministry of MM. Witos, Grabski, Skulski, and Daszynski resigned and was succeeded by a government headed by M. Pomikowski, which, in 1922, underwent a reconstitution. The new ministry, however, lasted only four months, for in June, 1922, it was overthrown, and after considerable wrangling between the Diet and the President, a new ministry was headed by M. Nowak. During this period, there had been no legislation of any constructive character. It was not until November, 1922, that elections were held for members of the national Diet. In the following month, both Houses assembled for the election. The domestic uncertainty was heightened by the complexion of the national Diet. The national parties of the right and the left had, in the election, succeeded in gaining an equal number of seats, 177 each, so that the balance of power was thrown to the minority parties, e.g., the Jewish, Ukrainian, German, and Russian, who controlled, in all, some 90 votes. These parties united with the left and forced the election of M. Gabryel Narutowicz as the first president of the republic to succeed the provisional president, General Pilsudski. M. Narutowicz, a brief 48 hours after he assumed office, was assassinated (December 16) by a demented painter. Demonstrations against the racial minorities, and the Jews in particular, indicated the popular excitement in the week preceding the assassination. On Dec. 20, 1923, M. Wojciechowski was selected to become the new president.

The racial problem, that of the Jew above all, was a serious one. Though Poland, in common with other Succession States, had signed a minorities treaty with the Allies, and in particular had guaranteed the Jews educational and religious liberties, the inability or refusal of the government, especially during 1918-20, to defend the Jews from attack aroused much apprehension. Charged with being German sympathizers and fraternizing with the Bolsheviks, but above all, held in contempt because of their alleged lack of Polish patriotism and their adherence to trade, the Jews were made the object of discrimination and disparagement in a manner quite incomprehensible to western Europeans and Americans. By a social, economic, and educational boycott, all things Jewish were declared taboo. Jewish officials were dismissed, shops blacklisted, and professional men, i.e., teachers, doctors, and law-

yers, dropped from the universities, army, and administrative posts. The Poles charged that the Jews consistently refused to conform their customs and life to those of the Poles about them; that the Zionist movement fostered a growing separatism. The Jews contended that political representation in proportion to their numbers was denied them, for although they formed about one-seventh of the population, they had only 11 members in a national Assembly of 390. Again, they claimed, the perpetual discriminations in education, politics, and the professions prevented the Jew from rising above the petty mercantile class and taking up those other pursuits where he might come in contact with the general cultural ideas of the West. There were excesses during 1918-20, which did not cease completely even by 1924. Sir Stuart Samuel, on a mission to the country, ascertained that at least 348 Jews had lost their lives as the result of rioting and the depredations of the soldiery. Other outrages were innumerable. Mr. Morgenthau, heading an American mission, reported similarly.

Internal affairs in the midst of such a tumultuous political and economic scene also, naturally enough, were muddled. The country was four-fifths agrarian, settled by an uneducated and unskilled peasantry working on lands of which 40 per cent were owned by 18,000 proprietors. To create a class of small landowners (for which, already, there was an ambitious programme formulated in 1921), to teach them modern technique, and then to provide them with opportunities for reaching their markets by the development of means of communication, were the insistent problems which a depleted treasury and a continually falling currency could do nothing to alleviate. The cost of living steadily mounted to the accompaniment of the inevitable strikes and lockouts. In July, 1923, about 70,000 textile workers were out in Lodz alone; 90 per cent of the men in the engineering trades of Warsaw were idle at the same time; there were building strikes in Posen and Lublin and labor disturbances in almost all the industrial centres. Cabinets continued to follow each other in rapid succession. During 1923, M. Witos, of the Peasant Party, headed a government for a time but before the end of the year he was defeated and surrendered his place to M. Grabski. The drift was steadily toward the right. It became evident in 1924 that the real problem before Poland was fiscal reform and a balanced budget.

In the field of foreign relations, Poland indicated a desire to come to an amicable understanding with most of her neighbors. On Mar. 3, 1921, a treaty was signed at Bucharest providing for an offensive-defensive Polish-Rumanian alliance and conversations for the further strengthening of this union were carried on in June, 1923. As a result of the settlement of the Upper Silesia question, measures were taken in 1921 for the restoration of friendly relations with Germany. On Nov. 7, 1921, a treaty with Czechoslovakia was signed at Prague by which each nation guaranteed the other a benevolent neutrality in the case of attack, as well as the recognition of each other's rights in Slovakia and Galicia. For the development of trade and transport with Russia, commissions were appointed, while the export of agricultural implements to Russia and the Ukraine was encouraged. In accordance with this spirit, on Sept. 2, 1923, a note was delivered at Moscow declaring Poland's readiness to recognize the Soviet Federation upon the acceptance by all

of its constituent parts, of the terms of the Riga Treaty.

Improvement in the relations with Danzig were marked after the agreement of 1921. On Mar. 17, 1922, Poland signed with Finland, Estonia, and Latvia an agreement for the establishment of an enduring peace, while later in the year representatives of the Baltic States met with Russian commissioners for the purpose of effecting a general disarmament in the region. By the end of October, the boundary between Poland and the Ukraine had been definitively fixed by a mixed commission. As far as general international affairs were concerned, however, Polish policy seemed to be all in the interest of France. The French attitude toward Poland had been persistently friendly, so that by ties of gratitude Poland was united to her western ally. During 1916-19, the French had encouraged the organization of the Polish Legion and had championed Polish aspirations at the Peace Conference, going so far as to favor Polish claims to all Upper Silesia and both banks of the lower Vistula, and Danzig. In 1920, too, France had come to the aid of Poland in the Russian War and in the next year both had signed a defensive alliance. A general political alliance, pledging economic and diplomatic cooperation, and promising concerted action in case of unprovoked attack, was signed by France and Poland on Feb. 19, 1921. The alliance was supplemented by a commercial convention (Feb. 6, 1922) providing for reciprocal tariff concessions, by a loan agreement (1923) extending to Poland a French advance of 400,000,000 francs to be expended mainly for strategic railways and other military purposes, and by other commercial and military agreements. Under the friendly protection of France, and in close concert with the Little Entente to the south and the Baltic nations to the north, Poland had become the cornerstone of the barrier between Bolshevik Russia and vengeful central Europe. It was a position of strategic importance and prestige, but likewise of potential peril.

As the turbulent first years of the restored nation receded, Poland attempted to set her house in order by effecting a number of internal adjustments. On July 9, 1924, Parliament passed a law designed to conciliate the radical minorities. It permitted the use in schools, in courts, and before administrative authorities of the languages of the Ukrainians, the White Russians, the Ruthenians, and the Lithuanians, but not the Yiddish language. In June, 1925, an agreement was reached between the Government and representatives of the Jews intended to lessen the antagonism between the Jews and the anti-Semitic elements, and the attitude unfavorable to Poland taken by Jews in foreign countries, including the United States. The agreement included concessions to the Jews, reduction of certain taxes on small businesses which were exclusively in the hands of the Jews, permission to shops to open for a limited time on Sundays, etc. The Jews on their part agreed to cease general opposition to the Government and acquaint those in other lands who would be interested with the conciliatory moves on the part of the Government. In September, 1925, a mission was sent to Warsaw by the Ecumenical Patriarch of the Orthodox Church to proclaim the autocephalous status of the Church in Poland which had been declared by the Holy Synod in 1921.

On Dec. 28, 1925, Parliament finally passed on a long-debated measure providing for the com-

pulsory distribution, on a limited scale, of large holdings of land. It represented a compromise between the conservatives and the extremists who urged the seizure of the large estates without compensation, providing for the transfer of 200,000 hectares annually for ten years. Payment was to be made partly in cash and partly in bonds. Large estates, however, were to be broken up only to the extent that land sales by peasants in a given year fell short of the figure named.

More momentous than all these measures, however, was the nation's struggle to emerge from the period of post-war inflation and set its finances on a sound basis. Recognizing the necessity for such action, the political parties declared a truce at the close of 1923 and placed the government in the hands of a coalition cabinet, headed by M. Grabski, Premier and Finance Minister. On the following January 3, Parliament granted him emergency powers with respect to finances. He attempted, through a series of vigorous measures, to arrest the rapid decline of the mark and lay a foundation for sound fiscal operation. Drastic economies were instituted in government expenditures. Efforts were made to put the state railways, which had been a heavy drain on the Treasury, on a self-supporting basis. Payment of certain property taxes was advanced two months and new taxes were laid. With the resulting funds and the proceeds from domestic gold loans, the Premier was enabled to halt the printing presses from turning out fresh issues of paper so rapidly. His whole scheme looked toward the stabilization of the finances. He soon announced a new currency having a gold-exchange basis, with the "zloty," equal in value to the gold franc, as the unit. It was put into effect on May 1. The National Loan Bank was abolished and on April 28 the National Bank of Poland as the sole bank of issue began operations.

The purpose of this programme was to make possible the balancing of national expenditure and revenue and to give the country, for the first time since its restoration, a sense of financial health, but the remedial measures proposed and partially put into effect (particularly the wiping out of the national debts) were so severe that for a while the people paid heavily. On the whole, this financial reform was not a success and, when Grabski left the ministry, Poland was on the verge of bankruptcy. Most of the items in his reform programme had been undertaken against the advice of the British financial adviser, as well as Polish economists. The failure of the programme indirectly led to the Pilsudski coup. In 1924 and 1925, the large currency reduction and sharp limitations on credit slowed down production to the point where distress became acute. There was much unemployment. Exports fell off and the maintenance of the exchange rate became very difficult. The harvest of 1924 was bad, foodstuffs had to be imported, and prices materially increased.

In November, 1924, Poland funded her war-relief debt with the United States and in December, her debt with Great Britain, and in February, 1925, floated a loan of \$35,000,000 in the United States. While these acts helped to restore a feeling of confidence, the terms of the financial settlements and of the loan brought sharp criticism. Through 1925 the conditions of economic distress persisted, and gradually the Government's financial position was weakened. While the Bank of Poland kept rigidly to its policy of currency restriction, the pressing demands for

currency brought about a mounting issue by the Government of unsecured notes and small coins whose total presently exceeded that of the bank's note issue itself. The value of the zloty could not be maintained and it fell to about one-half its nominal value. The economic distress brought in its wake the natural political consequences. In November, 1925, the Grabski ministry resigned and was succeeded by a coalition cabinet formed by Count Skrzynski. The new ministry stopped the issue of government notes and reduced the military and civil establishments, and the resulting financial improvement was reflected in a temporary rise of the zloty; but internal dissension continued, and dissatisfaction was increased by nervousness over the state of foreign relations. At the close of April, the Socialists withdrew their support from the government and the ministry was forced to resign. On May 10, the peasant leader, Witos, formed a government.

At this juncture, Marshal Pilsudski intervened. Living in retirement near Warsaw, he had found popular sentiment turning more and more to him as the one national figure capable of leading the nation out of its maze of difficulties. The situation was brought to a head by a dispute over the position of Pilsudski himself. Slated for the office of inspector general of the army, he insisted that the post be kept quite free from Parliamentary control, but the Government, strongly supported by the Right, proposed to make it thorough subservient to Parliament. On May 12, Pilsudski placed himself at the head of a body of troops loyal to him and entered Warsaw. During nearly two days of street fighting, the Government resisted, branding Pilsudski as a rebel, but a general strike prevented them from bringing up reinforcements and Pilsudski was soon master of the situation. The Witos cabinet and the President of the Republic resigned. Rataj, Marshal of the Parliament, became acting President. On May 31, the two Chambers of Parliament elected Pilsudski President by a large majority, but he refused the office, which then went to one of his supporters, Professor I. Mosicki. In the middle of June, Pilsudski became commander-in-chief of the army, with powers quite independent of Parliament or the cabinet. Although he was admittedly dictator, he refrained from assuming absolute power, and the opposition to him in Parliament continued strongly in evidence. It was sufficient in October to cause the resignation of the Bartel ministry, which had been placed in office following the coup in May. Pilsudski himself thereupon assumed the Premiership.

In the meantime, constitutional changes had been effected, the most significant of which gave the President power to issue decrees with the force of law when Parliament was not in session. The Government made use of this power to bring the national finances back to a sound position, as they had been drifting again toward inflation. It reaffirmed the invitation extended by the Skrzynski government to a commission headed by the American expert, Prof. E. W. Kemmerer, to make a thorough study of Polish finances, and the commission's chief recommendations were adopted. The British coal strike in 1926, bringing a foreign demand for Polish coal, and the harvesting of good crops materially helped, and the Government was able to stabilize the zloty unofficially at about nine to the dollar, and to balance the budget. During 1926 the economic situation continued to improve and in October, aided by a loan of \$70,000,000 obtained through

American bankers and floated in New York, London, and other cities, the Government was able to stabilize the currency permanently. The value of the zloty was fixed at 8.9 to the dollar. A new currency system with gold, silver, and bronze coins was introduced. An American economist and financier, Charles S. Dewey, was appointed financial adviser to the Government with another American, Dr. E. Dana Durand, also an economist and statistician, as assistant. The finances of the country, following these moves, were soon in excellent shape.

While these internal readjustments were in progress, the foreign relations of Poland on the whole showed continued improvement, although they were marked by many disagreements which brought severe strains. Early in 1925, a brush occurred with the Free City of Danzig when Polish representatives set up a number of Polish letter-boxes in the city. The ensuing dispute was referred to the League of Nations and was settled by a decision of The Hague Court on May 16, favoring the Polish contention. A change in the Danzig administration in the summer brought much better feeling between the city and Poland.

With her other neighbors, except Germany and Lithuania and on one occasion Russia, Poland's relations were characterized by a friendship of increasing cordiality. In February, 1925, a concordat was signed with the Holy See. On July 13, the Polish Parliament ratified the arbitration convention signed by the four states, Poland, Latvia, Finland, and Estonia. Arbitration treaties were likewise signed with Czechoslovakia and Austria, a treaty of friendship was concluded with Yugoslavia, the alliance with Rumania was renewed, and commercial conventions arranged with a number of countries. With the United States, a *modus vivendi* existed. Negotiations for a treaty were pending in 1929.

With Germany, however, a state of latent friction over the western frontier of Poland kept a continual tension in diplomatic relations. Efforts by the Powers in 1925 to come to an agreement by which existing boundaries would be guaranteed were heartily seconded by Poland, but public opinion was aroused by German insistence on making an exception of the Polish-German frontier and the evident intention to seek a realignment of it. In the interest of security, Poland gave full support to the Geneva Protocol and later accepted the Locarno treaties although they aroused considerable criticism. The strain in German-Polish relations was not helped when, on June 15, 1925, a tariff war followed the failure to negotiate a commercial treaty and when friction also resulted over an exchange of nationals prescribed by the peace treaty.

When the question of the admission of Germany to the League Council came up in the spring of 1926, Poland, influenced by France, insisted also on having a permanent seat, but was finally induced to accept a three-year membership on the Council with privilege of reelection. The coolness remained through 1926, but late in the following year an attempt was made to reach a commercial agreement which would end the tariff war, and several unfruitful conferences were held. The opposition of German agrarian interests to the importation of Polish products, however, blocked all attempts to conclude a treaty. Although efforts were renewed in 1928, the same factor prevented their success.

Still more serious was the hostility between Poland and Lithuania, an aftermath of the Vilna

dispute. Refusing to acknowledge the award of Vilna to Poland, Lithuania maintained the attitude of being in an actual, though inactive, state of war with Poland. A conference in October, 1925, failed to achieve an understanding, and during the following two years the situation remained unchanged; but in December, 1927, Premier Valdemaras of Lithuania met with Marshal Pilsudski at the meeting of the Council of the League of Nations and agreed to end the "state of war" and work for a better understanding between the two countries. During 1928 several attempts were made to come to a definite agreement, but a conference in May and another in November broke up without results. Between Russia and Poland, the events of 1925 in Europe, particularly the Locarno treaties, induced a more friendly feeling, strengthened by the visit to Warsaw of the Soviet Foreign Minister Tchicherin in September. It did not, however, flower into a formal written undertaking. In 1927, the murder at Warsaw of the Soviet Minister to Poland, Peter Voikov, by a young Russian, led to the exchange of a number of acrimonious notes, but the incident was closed following the conviction and sentencing of the assassin. It had interrupted negotiations for a treaty of commerce and friendship which were later resumed. A Polish delegation visited Moscow in January, 1928. In February, a railway treaty between the two countries was signed at Vilna. At the close of 1928, Poland agreed to the Russian proposal for the signing of a protocol to the Kellogg-Briand Treaty, along with other countries of central Europe, by which the pact was to come into immediate effect as between those countries.

Up to midsummer, 1929, the Pilsudski dictatorship had shown no signs of weakening. In March, 1928, Parliamentary elections apparently returned a majority favorable to Pilsudski. When that body elected a speaker, however, his candidate was defeated by a Socialist. In May, a serious illness forced Pilsudski to retire temporarily, and the opposition gained the upper hand in Parliament. He returned to the helm in June, prorogued Parliament, accepted the resignation of most of his cabinet, and then himself resigned the Premiership, taking the position of Minister of War. M. Bartel once more became Premier, although there was no doubt that he was merely the dictator's agent and that the full power of the dictatorship remained. The opposition to Parliament which had marked Pilsudski's policy from the beginning increased. His former adherents, the Socialists, turned against him, and joined the opposition. In the summer of 1928, he attacked that body in a newspaper article of extraordinary violence. In January, 1929, as an expression of his dislike, he refused to attend the hearings on the budget and later severely criticized the budget adopted.

It was understood that this antagonism was to find full expression in the governmental reorganization provided by the long-awaited new constitution. The draft of this constitution, framed under Pilsudski's direction, appeared on Feb. 21, 1929, and fully confirmed these expectations. The chief feature of the new instrument was the transfer of power from the legislative to the executive. The President, who would be chosen by popular vote for a seven-year term, would have sole power to conclude treaties, possess the veto power over legislation, appoint ministers (responsible only to him, the President), and open and dissolve Parliament.

In the spring of 1929, a cabinet reorganization was made necessary by the resignation of Finance Minister Czechowicz, who had been impeached by Parliament on the charge of making large expenditures in excess of the budget without the approval of Parliament. Pilsudski assumed full responsibility for the act and the trial was brought to an inconclusive close. This was on March 8. On April 3, Premier Bartel resigned and there were changes in other posts. On April 14, Major Casimir Switalski, a Pilsudski adherent, became Premier, presiding over a cabinet made up of close followers of the dictator. With full control of the government and apparently with the support of the people, Pilsudski's position in the summer of 1929 appeared stronger than at any time since the *coup d'état*. See DANZIG, LITHUANIA, SILESIA, UPPER; VILNA; GALICIA, EAST; UKRAINE; WORLD WAR, *Eastern Front*.

POLAR RESEARCH. The polar regions are becoming increasingly familiar to the world and the last 15 years have seen the unexplored part of the Arctic Sea substantially diminished. The more obvious, superficial surveys which the airplane and the airship make possible have in most cases been followed by careful and detailed studies.

Arctic. The Canadian Arctic Expedition, 1913-18, was divided into two parties, the northern under Stefansson and the southern under Anderson. Stefansson's plans were disarranged by the loss of his ship, the *Karluk*. Continuing his explorations under difficulties, Stefansson traced the continental shelf of the Arctic Ocean from Melville Island, northeast to 80° 7' North Latitude, 94° 54' West Longitude, discovered Meighen Island and mapped parts of Ellef Ringnes and Amund Ringnes lands and Lougheed Island. He made extensive sledge journeys on the ice north of Alaska, later his assistant Storkerson attained by sledge approximately 74° North Latitude, 150° West Longitude. During these expeditions, Stefansson made it a point to live off the country so far as possible and was generally successful. The southern division under Anderson did less spectacular work but made a thorough biological and physical study of the northern coast of the Northwest Territories. The official reports form a valuable contribution to science as they treat of the fauna, flora, ethnology, etc. of the Canadian Arctic.

On his 1913-17 expedition, MacMillan penetrated into the unknown regions northwest of Grant Land to the alleged site of Crocker Land, reported as a discovery by Peary, and proved its nonexistence. His second voyage, 1921-22, was to Baffin Island where he mapped a coast line, explored the interior, and made collections of its fauna and flora. The MacMillan Expedition of 1923-24 included work on the glaciers of the Kane Sea regions. He erected at Cape Sabine the tablet of the National Geographic Society marking the final work of the Greely Expedition which represented the United States in its first scientific coöperation with other nations—the International Circumpolar Stations, 1881-84.

The Fifth Thule Expedition of Rasmussen, 1921-24, engaged in a biological, anthropological, archaeological, ethnological, and folklore survey of the Eskimo tribes living on the Arctic edge of North America. Amundsen had originally planned to drift the *Maud* across the Arctic Ocean starting from Bering Strait. Forced to

winter, owing to ice conditions, at Aion Island, Siberia, in 1919-20 he discovered new islands and made collections of fauna and flora and studied the native Chukchees. Two dispatch bearers perished en route to Norway. Renewed efforts the next year damaged the ship so that Amundsen was forced to return.

Russians pursued explorations along the Siberian coasts with a view to establishing regular summer sea traffic, but the results were unsatisfactory. Vilkitski in 1915 completed the Northeast Passage from east to west. It was learned that the missing Russian Polar Expeditions of Russanoff and of Brusiloff perished east of Franz Josef Land.

Since 1924 polar discovery has been characterized primarily by the use of aerial transportation as a medium of exploration. The International Society for the Exploration of the Arctic Regions by Means of the Airship was organized in 1926. With members from twenty nations, the value of this Society as a coordinator of polar research is very evident. The programme of the Aeroarctic, as the Society is popularly termed, includes the publication of the Quarterly, *Arktis*, which was commenced in 1928, the establishment of scientific observatories in the Arctic; and extended exploration with the *Graf Zeppelin* in 1930 under the leadership of Fridtjof Nansen. In 1925 MacMillan led an expedition to Etah, Greenland, under the auspices of the National Geographic Society and the U. S. Navy Department. The chief interest centred in a naval unit of three planes and nine men under Commander Byrd. Because of adverse conditions, flying operations were limited to 15 days. Explorations of the Arctic Sea proved impossible because of the difficulty of establishing supply bases and although a number of flights were made, they served principally to familiarize the aviators with arctic flying.

On May 21, 1925, Amundsen with two men in the *N-25* and Ellsworth with two companies in the *N-24* started from Kings Bay, Svalbard, for the North Pole. Forced down within 136 miles of the Pole by a westerly drift which cost them the fuel necessary to make their goal, the two groups devoted their energies to getting the *N-25* into the air. After many failures, this was accomplished on June 15 and the entire party reached the coast of Spitzbergen where they were picked up by a sealer.

Commanded by O. Wisting, Amundsen's whaler *Maud* entered the Arctic Ocean at Bering Strait in August, 1922, drifted for two years along the northern coast of Eastern Siberia and returned to Nome, Alaska, on Aug. 22, 1925. Although the ship failed to traverse a new region, the scientific work under Sverdrup was of significance along magnetic, meteorological and oceanographical lines.

The year 1926 saw a renewal of aerial flights in the Arctic. Establishing his base at Kings Bay, Svalbard, Commander Byrd, with Bennett as pilot, on May 9 flew a Fokker plane to the North Pole and returned to his base in 15½ hours. No new land was seen over the 9000 square miles of hitherto untraversed territory.

On May 13, 1926, the Amundsen-Ellsworth-Nobile Transpolar Expedition completed a 71-hour flight in the dirigible *Norge* from Kings Bay, Svalbard, across the North Pole to Teller, Alaska. Radio communication was maintained until 87° North Latitude after passing the

Pole. This 2700 mile flight eliminated a large area from the unknown, but to the north of Alaska where land is more probable, visibility was poor. Adverse weather conditions over Alaska confused navigation and forced the landing at Teller.

In 1926 the Cambridge Expedition to East Greenland, under Wordie, explored the coast from Scoresby Sound to Sabine Island where pendulum observations were made. High mountains were discovered in the vicinity of Petermann Peak. Basing his expedition on the maps by the Cambridge Expedition, Lauge Koch made two geological reconnaissance expeditions along the East Greenland coast during the winter and spring of 1926-27. MacMillan visited Greenland, Baffin Island and Labrador in 1926 to make collections for the Field Museum. George Palmer Putnam in the *Morrissey* reached Etah on a collecting expedition for the American Museum of Natural History. Putnam again went north in 1927 when, on visiting southwestern Baffin Island, his surveys eliminated some 5000 square miles from earlier maps of Foxe Land.

Desirous of searching for new land, of studying the feasibility of establishing meteorological stations in the Far North, and of proving the efficiency of the airplane in high latitudes, Captain Sir Hubert Wilkins in 1926 frequently crossed the Endicott Mountains on flights between Fairbanks and Barrow, Alaska, and made one reconnaissance flight of 150 miles over the Arctic Sea. On March 29, 1927, with Eielson as pilot, he flew from Point Barrow to latitude 77° 45' North, 175° West Longitude, where a sounding was taken which revealed a depth of 5440 meters (17,847.7 feet). The gas supply failed before land was regained and the aviators walked and drifted for over 250 miles before reaching land. On April 15, 1928, traveling a previously plotted course to the north of the Canadian Arctic Archipelago, Wilkins accomplished a 21½-hour flight from Point Barrow to Dead Man's Island, Svalbard. Good visibility during this remarkable flight enabled him to reduce considerably the extent of unexplored area between North America and the North Pole. Kings Bay, Svalbard, served as the base for the dirigible, *Italia*, which made three polar flights in May, 1928, under the command of General Nobile. The first trip, to Franz Josef Land, was curtailed because of fog; the second was over the vicinity of Northern Land, on the third flight, which reached the North Pole, the *Italia* was wrecked near Northeast Land. Two weeks later, communication was established between the *Citta di Milano*, base ship of the expedition, and the occupants of the main gondola which had been torn from the bag when the airship first crashed. Many rescue expeditions were organized and on July 12 the Soviet ice-breaker, *Krassin*, reached the marooned men. Previously, Nobile was rescued by the aviator, Lundborg, and Dr. Malmgren lost his life in an attempt to reach land with two Italian companions who were later taken aboard the *Krassin*. In all, eight of the crew were lost and Captain Roald Amundsen and five others disappeared while flying to the rescue of the Italians.

In 1929 a Soviet expedition made a voyage to Franz Josef Land on the ice-breaker, *Sedov*, and the Soviet flag was raised over this territory on July 29. The exploring expedition was headed by Otto Schmidt, and Professors Vize and

Samoilovich who headed the expedition on the *Malygin* and the *Krassin*, sent to rescue the members of the *Italia* in 1928, were members of the party.

During 1928 MacMillan collected natural history specimens for the Field Museum in northern Labrador. The Third University of Michigan Expedition to Greenland under Professor Hobbs completed a year's study of meteorological conditions and their relations to the problem of world weather. At Angmassalik, the Rumanian Greenland Expedition under Dumbrava made observations similar to those of the Hobbs Expedition. The Oxford University Expedition to Greenland of 1928 continued its biological studies under Dr Longstaff.

In the Siberian Arctic, numerous expeditions under the Soviet Academy of Sciences have studied the ethnology and natural resources of the area. A colony was established on Wrangell Island in 1926. Efforts to reach the island in 1928 were unavailing due to ice conditions. In July, 1929, the Soviet ice-breaker *Lutke* left Japan for Wrangell Island with a party of scientists and explorers who were to remain there for several years.

Antarctic. The World War and the necessity of first trying airplanes in the more accessible and milder Arctic were causes for the lack of expeditions in the Antarctic during this period. Bold in plan and adventurous in execution was Shackleton's attempt to cross the continent of Antarctica from the *Endurance* in Weddell Sea to the *Aurora* in Ross Sea. In the *Endurance*, he penetrated Weddell Sea to 77° south latitude, 35° west longitude and, skirting the shores of the southern continent, added 200 miles of new (Caird) coast. No landing could be made and the ship, beset in ice and drifting with the main pack, was eventually crushed. After the sea-floe drifting north melted, the crew reached Elephant Island by boat from which isolated land they were finally rescued after four dangerous voyages by Shackleton. In 1917 this indomitable explorer rescued seven men of the *Aurora* marooned in Ross Sea where three had died in the meantime. On a subsequent antarctic voyage in the *Quest*, Shackleton died and was buried at South Georgia, 1922; the *Quest* reached, however, new positions in the Antarctic Ocean. Cope's Expedition 1920-23 wintered on the most southwesterly point reached on Graham Land, and there made extended physical observations. Its members, however, failed to cross Graham Land and explore the west shores of Weddell Sea.

Hoping to ward off depletion of the South Atlantic whaling grounds and effect a conservation of this very lucrative business, the British government in 1926 and 1927 equipped two ships, the *Discovery* and the *William Scoresby* and subsidized a systematic investigation of whales and their food. This was carried on at the whaling stations and in the surrounding waters of the Falklands and South Georgia.

Norwegian whalers, who are particularly active in the Antarctic, have accomplished considerable exploration in these waters. In 1926 the *Odd I* relocated Peter I Island, last reported in 1910. In 1927 a Norwegian group landed and took possession of Bouvet Island. The identity and exact location of this island have been geographical problems for many years—several islands having been reported from the neighborhood but proving elusive on further in-

vestigation. Great Britain has acknowledged the claim of Norway to this island. During the winter of 1928-29, the Byrd Antarctic Expedition established in the Bay of Whales, Ross Sea, a base for extended exploration of the Antarctic Continent. This large and well-equipped expedition left the United States in the fall of 1928 in three ships. Before him, Commander Byrd has the largest extent of unexplored land in the world, the possibility of conquering the South Pole by air and the opportunity of making valuable contributions to our knowledge of Antarctica. The 1928 Antarctic Expedition of Captain Sir Hubert Wilkins consisted of himself and three companions. Headquarters were established at the whaling station in the enclosed harbor of Deception Island where a perilous runway for the planes was prepared. On Dec. 19, 1928, Wilkins flew south through Graham Land and made the significant discovery that this peninsula is separated from the Antarctic Continent by a number of ice-filled depressions. Many new topographic features were noted and named.

POLÁSEK, ALBIN (1879-). An American sculptor and teacher, born at Frenstat, Moravia, who studied art at the Pennsylvania Academy of Fine Arts and the American Academy in Rome and in 1910 was awarded the Prix de Rome. After 1916 he was head of the department of sculpture at the Art Institute of Chicago. His sculptures have been exhibited at Rome, Paris, New York, Philadelphia, and Chicago and are on permanent exhibition at the Pennsylvania Academy of Fine Arts, the Metropolitan Museum of New York City, the Art Institute of Chicago, and the Detroit Museum. They include the bust of Pierpont Morgan at the Metropolitan Museum, a portrait of F. D. Millet at the Pennsylvania Academy of Fine Arts, "The Sower," at the Chicago Art Institute, "Aspiration," at the Detroit Institute of Art, and "Bubble," at the Milwaukee Art Institute.

POLICE POWER. See LAW, PROGRESS OF THE

POLING, DANIEL ALFRED (1884-) An American clergyman, who was born at Portland, Oreg., and graduated at Dallas (Oreg.) College. He pursued post-graduate studies at Lafayette (Oreg.) Seminary and at Ohio State University. In 1912 he was the Prohibition Party candidate for Governor of Ohio. He was a leader in temperance campaigns and active in federated church movements. During 1923-29 he was pastor of the Maible Collegiate Reformed Church in New York City. He resigned in the latter year to devote his entire time to his work for youth. He is president of the International Society of Christian Endeavor and editor of the *Christian Herald*. In 1929 he was elected president of the Session of the General Synod of the Reformed Church in America. He wrote *Mothers of Men* (1914); *Huts in Hell* (1918); *Learn to Live* (1923); *What Men Need Most* (1923); *An Adventure in Evangelism* (1925); *The Furnace* (1925); *John of Oregon* (1926); *Radio Talks* (1926-27); and *The Heretic* (1928).

POLISH LITERATURE. With the reunion of the divided portions of Poland and the reorganization of the Polish Republic, a new epoch in literature opened and, as if to stress this fact, there came a series of deaths which removed nearly all the well-known authors. Henryk Sienkiewicz, accepted by the world as

the pre-war representative of Poland, died in 1910. Wladyslaw (Ladislav) Reymont, who received the Nobel Prize for literature in 1924 for his novel, *The Peasants*, died in 1925; Stefan Zeromski, his great rival and the author of several historical novels, as *Asheva* and *The Wind from the Sea*, died a few months later. Jan Kasproicz, the Polish Wordsworth, died in 1920; and Stanislaw Przybyszewski, known for his psychological novels, passed away in 1927.

With this heavy necrology, Polish literature passed into a post-war existence, but this existence itself stresses those qualities of daring and of adventure that have always marked Polish painting. Thus, we have many volumes of what may be called semi-fiction, dealing with the almost incredible experiences of Poles on the Eastern front, in Siberia, and elsewhere. Perhaps we should group here the writings of Ferdinand Ossendowski, *Beasts, Men and Gods*, and *The Horse on the Hill*, by Eugeniusz Malaczewski, who was killed during the War. There is also *The Blaze*, by Mme Kossak-Szczucka. Other names in this group are Ferdinand Goetel and Wacław Sieroszewski. In all these works, there is a union of adventure and of action with an almost mystical appreciation of the peaceful mission of Poland. Jozef Wejssenhof and Andrzej Stug are other notable novelists, and the tradition of Reymont is continued by Orkan, who writes of village life in the Tatra.

In poetry, the leading writer is undoubtedly Leopold Staff, but his achievements do not measure up to those of the preceding generation. Jozef Tuwim is another author of the same Warsaw group of internationalists who are striving to express in their works emotions and themes which are common to all mankind. Opposed to them is the *Czartak* group from the Tatra Mountains, the members of which stress the rich lore of the Polish soil. In this group, Zegadowicz is the most prominent name.

Other forms of literature, as the employment of psychoanalysis, etc., also are practiced, but it is easy to see that we are dealing with the nucleus of a literature and not with its definite flowering. The sudden restoration of national life, the sudden change of the problems before the literary world, and the loss of the modern masters have created a confusion which will be satisfactorily resolved in a few years, when the young men and women who have been trained in a free Poland will hold the literature in their own hands and will have created something which is fully in accord with modern conditions.

POLISH NATIONAL COUNCIL. See POLAND.

POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF. A learned society founded in 1889 for the study of political and social science, including industrial and economic topics. Its bimonthly official publication, *The Annals*, is devoted to the discussion of a particular subject of political, economic, or social importance. Among the subjects treated in 1915 were industrial opportunity, America's interests as affected by the War in Europe, and public budgets; in 1916, preparedness and America's international programme, and new possibilities in education. In the following year, *The Annals* contained articles on the purposes and ideals of the Mexican Revolution, modern insurance problems, and the stabilization of industrial employ-

ment, and in May a supplement was issued, dealing with the Mexican constitution and the relation of the United States to international affairs. Some of the issues in 1918 were devoted to the discussion of the mobilization of American resources for war and relief work, rehabilitation, and labor. In 1919 international economics and the railroad problem were discussed; in 1920 the new American thrift, bonds and the bond market, revival of American business, and child welfare; in 1922 the Federal Reserve System, Russia, western Europe and the United States, in 1923, among other subjects, prohibition; in 1924 the Monroe Doctrine, in the January supplement, and the organization and work of the League of Nations, were outstanding subjects of discussion. In 1925 the agricultural situation in the United States, and power; in 1927 the installment plan of buying, aviation, and Philippine independence were treated in separate issues; and volumes in 1928 were devoted to the subject of the large inland waterway projects in the United States, the international situation, stabilization of commodity prices, and the American Negro.

In 1923 the Academy was addressed by Sir Auckland Geddes at the annual meeting and two conferences were held in that year on the coal industries and the Monroe Doctrine, respectively. Subsequent annual meetings, for the most part, considered some phase of the international situation, usually America's relation to the European situation, the subject in 1928 having been Some Aspects of the Present International Situation. Other meetings in 1928 discussed Local Taxation, The Reconstruction of Belgium, and Freedom of Speech in the United States. The president in 1928 was Dr. L. S. Rowe, who had held this position since 1902; vice presidents were Dr. Ernest Minor Patterson, the Hon. Herbert C. Hoover, and Dr. Charles F. Merriam; secretary, Dr. J. P. Lichtenberger, and treasurer, Charles J. Rhoads.

POLITICAL SCIENCE, ACADEMY OF. An organization founded in 1880, composed of men and women interested in political, economic, and social questions. It functions, in cooperation with Columbia University, through two annual meetings, and its publications, *The Political Science Quarterly*, *The Annual Record of Political Events*, and *The Proceedings*, a semi-annual in which are printed the papers submitted at the general meetings.

Various articles by authorities on public questions of national and international scope appear in the *Quarterly*. War debts, taxation, the future of prices, popular ownership of property, and trade associations were some of the topics discussed at recent semi-annual meetings. In 1926 a meeting at Briarcliff Manor, N. Y., took the form of an international conference on the subject of the United States in relation to Europe, with representatives of England, France, Germany, and Switzerland participating.

The members of the academy numbered 6853 at the opening of 1929, 10 being honorary, 215 life, and approximately 1100 subscribing members, chiefly libraries and organizations. Both active and subscribing members are drawn from every part of the United States, and from Porto Rico, Hawaii, the Philippine Islands, and leading European countries. Officers for 1928 were: Samuel McCune Lindsay, president; Albert Shaw and Paul M. Warburg, vice presidents, Parker T. Moon, secretary and editor of the publications;

George A. Plimpton, treasurer; and Ethel Warner, secretary and assistant treasurer. The headquarters are in Fayerweather Hall, Columbia University, New York City.

POLITICS, INSTITUTE OF. An annual session founded at Williams College, Williamstown, Mass., through the generosity of Bernard M. Baruch, and continued with the financial coöperation of the General Education Board and the Carnegie Corporation, for the purpose of advancing the study of politics and promoting a better understanding of international problems and relations. Although the institute was proposed in 1913, the first session, as a result of various conditions, was postponed until the summer of 1921. Membership is limited to men and women who are members of faculties of colleges and universities, to writers on foreign politics, to persons engaged in the direction of foreign commerce or banking, to diplomatic and consular officials, to officers of the Army and Navy, to editors, foreign correspondents of the press, and, by invitation, to others who have had training and experience in international law and politics. The public interest is advanced through lectures, conferences, and round-table discussions, under the leadership of authorities on international problems.

At the first session, held in July and August, 1921, and devoted to the study of international relations, among those present were Viscount James Bryce of England, Count Paul Teleki of Hungary, and Tommaso Tittoni of Italy. The second conference, devoted also to international relations, gave special emphasis to problems of central and eastern Europe, the Far East, and Latin America, and attracted such eminent scholars and statesmen as Lionel Curtis and Philip Henry Kerr of England, Manoel de Oliveira Lima of Peru, and Dr. Joseph Redlich of Austria.

The third conference, which was held in 1923, was addressed by Gen. Tasker H. Bliss, Sir Edward Grigg of London, Count Harry Kessler of Berlin, and others, and special interest centred in the various international aspects of the Russian question. Among the visitors of international reputation who participated in the sessions in successive years were: Sir Paul Vinogradoff of Oxford, John Spayd, Count Alexander Skrzynski, Polish Prime Minister, Robert Masson of Paris, Leo S. Rowe of Washington, D. C., and Sir Frederick Maurice of London, in 1925; Dr. Alfred E. Zimmerman, commissioner of the League of Nations at Vienna, Sir Frederick Whyte, president of the Indian Legislative Assembly from 1920 to 1925, and A. Mendelssohn-Bartholdy, in 1926; Dr. Jacob Lange, Danish authority on agriculture, Dr. Robert Michels, professor of political economy at the University of Basel, Switzerland, Bishop Nicholai of Ochrida, Serbia, Moises Saenz, Mexican Under-Secretary of Education, and Dr. Peter Reinhold, formerly Minister in the Luther cabinet in the German Reich, and Count Carlo Sforza, member of the Italian Senate, in 1927; and at the eighth session in 1928, Halide Edib Hanum, leader of the feminist movement in Turkey, Dr. Otto Hoetzsch, member of the German Reichstag and professor of history at the University of Berlin, Dr. Louis Pierard, member of the Belgian Parliament, Dr. Y. C. James Yen, leader of the Mass Educational Movement in China, Dr. Chao Chu Wu, former Secretary for Foreign Affairs of the Nanking government, and Count Carlo Sforza.

At the 1929 session, the speakers of international reputation included George Young of London, Count Giovanni Elia of Rome, and Prof. T. E. Gregory of London. Lecture courses were conducted by Dr. William E. Rappard of Geneva on the Trend of International Coöperation in Europe since the War and by André Siegfried of Paris on the Political System in France. The round-table discussions included such topics as Canadian-American Relations; Limitation of Armaments; The Interests of United States Citizens in Latin America; Post-War Constitutional Changes in Europe; Planned Prosperity; The Effect of Public Fiscal Policies on Trade and Employment; Banking, Currency, and Exchange; Trade Relations as Affected by Politics, Science, and Finance; and Inter-Ally Debts and Reparations. Special general conferences were held on the following: Mexico: Financial, Social, and Political Changes since 1910; Financial and Commercial Relations with Latin America; American-Canadian Mineral Resources; Chinese-Russian Relations.

The administrative officers of the institute in 1929 were Harry Augustus Garfield, chairman; Walter Wallace McLaren, executive secretary, and Willard Evans Hoyt, treasurer. The headquarters are at 1 Hopkins Hall, Williamstown, Mass.

POLK, FRANK LYON (1871-). An American public official (see VOL. XIX). He was counselor to the Department of State from 1915 to 1919, when he became Under-Secretary of State. In the absence of Secretary Lansing in 1918-19, he was Acting Secretary of State. He was appointed Commissioner of the United States to negotiate peace in 1919 and was head of the American delegation to the Peace Conference in Paris from July to December of that year. He has since practiced law in New York City.

POLLARD, ALFRED WILLIAM (1859-). A British bibliographer who was born in London and educated at King's College School, London, and St John's College, Oxford. He was assistant and keeper in the Department of Printed Books of the British Museum (1883-1924), professor of English bibliography at King's College, University of London (since 1919), and editor of *The Library* (since 1920). In 1922 he was made a fellow of the British Academy and a Companion of the Bath. He edited *English Miracle Plays* (1890); *Bibliographica* (1894-96); *English Bookman's Library* and *Macmillan's Library of English Classics* (1900); a catalogue of early printed books in possession of J. P. Morgan (1907); *Records of the English Bible* (1911). He is the author of *Early Illustrated Books* (1893); *Shakespeare's Folios and Quartos* (1909); *Fine Books* (1912); *Two Brothers* (1916); *St. Catherine of Siena* (1919); *The Foundation of Shakespeare's Text*, the British Academy annual Shakespeare lecture (1923); *A Short Catalogue of English Books, 1475-1640*, in collaboration (1926); and other publications.

POLLOCK, CHANNING (1880-). An American author and dramatist, born in Washington, D. C. He studied at Bethel Military Academy at Warrenton, Va., and at the Polytechnique in Prague. He had a varied newspaper career before devoting his attention to dramatic writing. His later plays include: *A Perfect Lady* with Rennold Wolf, produced by Rose Stahl (1914); *Ziegfeld Follies of 1915*, with Rennold Wolf (1915); *The Grass Widow*, with Rennold Wolf (1917); *Roads of Destiny*,

produced by A. H. Woods (1918); *The Crowded Hour*, with Edgar Selwyn, produced by Selwyn and Company (1918); *The Sign on the Door*, produced by A. H. Woods (1919), by Gladys Cooper at the Playhouse in London (1921), and at the Théâtre Renaissance in Paris, as well as in Vienna, Madrid, Amsterdam, etc.; *Ziegfeld Follies of 1921*; *The Fool*, produced by Selwyn and Company (1922); *The Enemy* (1925); and *Mr. Money-penny* (1928). During 1923 he lectured under the direction of the Pond Bureau. Besides his plays, he wrote many stories and made dramatizations of numerous books.

POLLOCK, RT. HON. SIR FREDERICK (1845-). An English jurist and author (see VOL. XIX), Judge of the Admiralty Court of the Cinque Ports since 1914. In 1920 he was appointed King's Counsel and Honorary Fellow of Trinity College, Cambridge. New editions of his early works were frequently published, and he wrote *The League of Nations* (1920, 2d ed., 1922); *Essays in the Law* (1922), and *Outside the Law* (1927). For the Selden Society, he edited *Selden's Table Talk* (1927).

POLLUTION OF STREAMS. See SEWER-AGE AND SEWAGE TREATMENT.

POLO. The United States, Great Britain, India, and Argentina might be termed the polo centres of the world with the United States in 1920 possessor of the Hurlingham Cup, emblematic of the international championship. The U. S. government has done much to foster the sport of polo by furnishing mounts to various military units, colleges, and other institutions. A competition for the Hurlingham Cup was held in 1927 at Meadow Brook, L. I., and the United States four successfully defended the trophy by a score of 2 matches to 0. An international contest of unusual interest was that waged by United States and Argentine teams in 1928, also at Meadow Brook. The United States captured the first game, the visitors took the second, and then the United States triumphed in the third and deciding match. An international Military Title Trophy was placed in competition in 1923 by the Meadow Brook Club and was won by the U. S. Army four which defeated a British team in three straight matches. In 1925 the U. S. Army four again triumphed over the British at Hurlingham, England, in two straight matches. Among the United States colleges, Yale, Princeton, Pennsylvania Military College, and Harvard have made creditable progress in the development of powerful, smooth-working fours. Indoor polo tournaments have added a popular feature to the winter sports programme carried on in New York City.

POLYTONALISM. See MUSIC.

POMERANIA. See POLAND.

POMERENE, ATLEE (1863-). An American legislator (see VOL. XIX). He was United States Senator for the term 1911 to 1917 and was reelected in 1917 but defeated by Simeon D. Fess in 1922. In March, 1924, he and Owen J. Roberts were appointed by President Coolidge as counsel to investigate the question of oil leases and the criminal responsibility of persons whose connections with it had been revealed by the proceedings of the Senate Committee investigating oil leases. They secured the cancellation of Edward L. Doheny's lease on the Elk Hills, Calif., naval oil reserve in June, 1925, and of Harry F. Sinclair's lease

on the Teapot Dome, Wyo., reserve in 1926. Both decisions were upheld by the United States Supreme Court in 1928.

POMONA COLLEGE. A coeducational institution at Claremont, Calif., founded in 1887 under Congregational auspices but free from ecclesiastical control. The student enrollment for the year 1927-28 was 777, and the faculty numbered 72 in the autumn of 1928. The total invested funds of the college in 1928 amounted to \$3,728,883, of which \$2,408,403 represented endowment funds; the total income for the year 1927-28 was \$485,340; and the library contained 62,810 volumes. The honors course was inaugurated at Pomona College in September, 1924, and other developments between 1914 and 1928 included the enlargement of the campus, the improvement of a large central quadrangle and the erection of five large buildings. President, Charles Keyser Edmunds, Ph.D.

PONSELLE, ROSA MELBA (1895-) An American dramatic soprano, born in Meriden, Conn. Her musical talent showed itself very early and she received systematic instruction in singing and on the piano. At the age of 12, she sang solos in a local church, and at the age of 15, accepted her first engagement as pianist in a motion-picture house. Then she filled similar positions in New Haven and New York, and in the latter city also appeared in vaudeville. After further study there under William Thorne, she sang for Gatti-Casazza in September, 1918, and was immediately engaged for the Metropolitan Opera House. Her début there as Donna Leonora in Verdi's *Forza del Destino* (Nov. 15, 1918) was the sensation of the season and she leaped into fame at one bound, and ever since has maintained herself as a prime favorite and powerful drawing card. With her in the principal rôles, the management revived many older operas, such as Verdi's *Don Carlos*, Lalo's *Le Roi d'Ys*; Rossini's *Guillaume Tell*, Weber's *Oberon*; Spontini's *La Vestale*, and Bellini's *Norma*. The climax of her triumphs probably was her London début as Norma (May 28, 1920), when after the *Casta Diva* aria the audience, disregarding the time-honored custom of no applause till the fall of the curtain, broke into frantic demonstrations.

PONSONBY, ARTHUR (AUGUSTUS WILLIAM HARRY) (1871-). A British public official and pacifist, educated at Eton and at Balliol College, Oxford. He was page to Queen Victoria from 1882 to 1887, was connected with the diplomatic service at Constantinople and Copenhagen from 1894 to 1899, was in the Foreign Office (1900-02), and from 1906 to 1908 was private secretary to Sir Henry Campbell-Bannerman, the Premier. He was a Liberal member of Parliament from 1908 to 1918, a Labor member after 1922, and in 1924 was appointed Under-Secretary of State for Foreign Affairs in the Labor cabinet of Ramsay MacDonald. He published *The Camel and the Needle's Eye* (1900); *The Decline of Aristocracy* (1912); *Democracy and Diplomacy* (1915); *Wars and Treaties, 1815-1914* (1917); *Rebels and Reformers*, with Dorothea Ponsonby (1917); *Religion in Politics* (1921); *English Diaries* (a review of English diaries from the sixteenth to the twentieth century, 1923); *Now is the Time, an Appeal for Peace* (1925); *More English Diaries* (1927); *Scottish and Irish Diaries* (1927); *Samuel Pepys* (1928); *Letters of the Empress Frederick* (1928); and *Falsehood in War-Time* (1928).

PONTOPPIDAN, pôn-tôp'-Dàn, HENRIK (1857-). A Danish novelist (see VOL. XIX). In 1917 the Nobel Prize for literature was divided between him and Karl Gjellerup. His later publications include *Enslavs Dod* (1915); *En Fortælling-Kres* (5 vols., 1915-16); *Fay-singholm* (1916); *Sandinge Menighed* (1916); *Torben og Jytte* (1916); *Et Kærlighedseventyr* (1918); *En Vinterrejse* (1920); *Højsang* (1921); and *Mands Himmerig* (1927).

POOLE, ERNEST (1880-). An American author, born in Chicago. He graduated from Princeton in 1902 and for several years lived in the University Settlement in New York City. Here he accumulated material for articles and stories. His first published work was a play, *None So Blind*. This was followed by *The Man's Friends*, a play, *The Harbor*, a novel (1915); *His Family* (1917); *His Second Wife* (1918); *Blind* (1920); *Beggar's Gold* (1921); *Danger* (1923); *The Avalanche* (1924); *The Little Dark Man* (1925); *The Hunter's Moon* (1925); *With Eastern Eyes* (1926); *Silent Storms* (1927).

POOLE, REGINALD LANE (1857-). An English historian (see VOL. XIX). He continued as editor of the *English Historical Review* until 1920, as curator of the Bodleian Library until 1926, and as lecturer on diplomacy at Oxford until 1927, was vice president of Magdalen College (1922-23) and of the Royal Historical Society (1925-27), and received an honorary degree in philosophy and letters from the University of Louvain in 1927. His later publications include *Lectures on the Papal Chancery* (1915); *Benedict IX and Gregory VI* (1917); *The Early Correspondence of John of Salisbury* (1924); and *Chronicles and Annals* (1926). He also edited the *Historia Pontificalis of John of Salisbury* (1927).

PORCHÉ, pôr'shê', FRANÇOIS (1877-). A French poet and playwright. His plays *Les Butors et la Fimette* (1917); *La jeune fille aux joues roses* (1919); *La dauphine* (1921); *Le Chevalier de Colomb* (1922); and *La vierge au grand cœur*, Joan of Arc (1925), were largely in verse. The sound and rhythm of the verse followed the action closely and subtle contrasts were emphasized by a quiet and delicate humor. His poems include *Humus et poussière*, *L'arrêt sur la Marne* (1916), and *Le poème de la tranchée* (1916). He also wrote *La vie douloureuse de Charles Baudelaire* (1926); and *Charles Baudelaire* (1928).

PORK. See LIVE STOCK.

PORTER, A (RTUR) KINGSLEY (1883-). An American art historian. He graduated from Yale in 1904 and studied architecture at Columbia University. After several years of travel and study, he became lecturer and then assistant professor at Yale University. In 1920 he was appointed professor in the history of art at Harvard University. He has served as exchange professor in France and Spain (1923-24). Among his best-known books are *Medieval Architecture* (1908); *The Construction of Gothic and Lombard Vaults* (1912); *Lombard Architecture* (1915-17); and *Romanesque Sculpture of the Pilgrimage Roads* (10 vols., 1923).

PORTER, HAROLD EVERETT ("HOLWORTHY HALL") (1887-). An American writer, born in Hyde Park, Mass. He graduated from Harvard in 1909 and for several years was engaged in the publishing business in Boston and New York. He served as captain of the Air

Service in the United States Army in 1918 and later in the same year was detailed to the office of the Secretary of War. In collaboration, he wrote an official history of all types of aeroplanes and engines made in the United States. His books include *Pepper* (1915); *Help Wanted* (1916); *The Six Best Cellars*, with H. M. Kahler (1919); *Egan* (1920); *Rope* (1921). He was coauthor of the one-act play, *The Valiant*, first produced in 1921. He was a frequent contributor of short stories to leading magazines.

PORTES GIL, pôr'tês' hîl, EMILIO (1891-). A President of Mexico, born in Ciudad Victoria and educated for a legal career there and in Mexico City. He joined the revolutionary movement which broke out at Vera Cruz in 1914 while still a student. Later, he became chief of military justice in Mexico City, Judge of First Instance and Magistrate of the Supreme Court in the State of Sonora (1915), Secretary of War to General Alvaro Obregón (1916), deputy to the National Congress, and, in 1920, Governor of his native State of Tamaulipas. He was serving as Secretary of State in the Calles administration when the assassination of General Obregón, the President-elect, resulted in his election as provisional President for the term Nov. 30, 1928, to Feb. 4, 1930. His administration was marked by a serious but unsuccessful revolt early in 1929 and the negotiation of an agreement for the settlement of the dispute between the Mexican government and the Roman Catholic Church in the summer of that year. See MEXICO, under *History*.

PORTLAND. A city and port of entry of Oregon. The population increased from 213,251 in 1910 to 258,288 in 1920 and to 354,608 in 1928, according to local estimate. Since 1914 the city has been engaged in carrying out a major street plan and port-development scheme. The programme has included the construction of eight principal streets, 100 feet wide, in the new and developing portions of the city and providing hauling streets, 120 feet wide, along the water front. A system of boulevards and parkways also was laid out, and a memorial civic centre planned. In 1928 an extensive street-widening scheme was inaugurated, for which \$4,000,000 in bonds had been voted. Nine grade crossings were eliminated by depressing the tracks and by constructing viaducts over them, the cost of \$1,055,000 being met by the railroad and the city together. In 1922 a bond issue was authorized for the construction of two concrete bridges over the Willamette River, \$3,000,000 being allotted for a new bridge on the site of the old Burnside Bridge and \$2,000,000 for another bridge at Ross Island. The first was about 3000 feet long with a bascule centre span; the second, which had no draw but a clearance at low water of 132 feet, was 4000 feet long.

In 1917 a \$3,000,000 bond issue was approved by popular vote for improving the facilities of the port of Portland, including the construction of a grain elevator of 1,000,000 bushels capacity and a dock and warehouse 1000 feet long and 175 feet wide. In 1923 the city purchased about a mile of water-front property between four downtown bridges for the purpose of building a sea wall and filling in land behind it. The interurban railroad tracks were then moved from streets in the city to the filled land,

interurban terminals constructed, and the approaches to the bridges elevated so that they would span the tracks. The channel depth of the Willamette River from Portland to its junction with the Columbia River was increased to 35 feet. In 1928 Portland became the largest wheat exporting port in the United States, 34,000,000 bushels being exported during a four-month period.

Building construction has been active in Portland, building permits having increased in value from \$8,334,075 in 1914 to \$28,973,452 in 1928. Among the buildings erected during 1927 and 1928 were the Masonic Temple, Terminal Sales Building, Pacific Building, Public Utilities Building, Dental Office Building, and Jewish Synagogue. In addition to the new \$1,000,000 post office, the Federal Building is to be erected by the United States government at a cost of nearly \$2,000,000. In 1924 a new sewer in the Lents district, costing \$780,000 and a water conduit with a capacity of 65,000,000 gallons were constructed by the city, in 1929 the Bull Run reservoir, with a storage capacity of 31,000 acre-feet of water, was completed at a cost of \$2,800,000. In 1927 the Portland municipal airport was located on Swan Island, a site provided by the port of Portland. The Columbia River Highway and the Pacific Highway intersect at Portland, making it the centre of one of the finest paved-highway systems in the United States. In 1927, 20,318 persons were employed in 766 industrial establishments and received \$27,213,628 in wages; the value of products manufactured was \$146,973,636. Bank clearings increased from \$578,884,000 in 1914 to \$1,978,930,066 in 1928. The assessed valuation of property in Portland in 1927 was \$338,462,000; the net debt was \$43,967,000.

PORTLAND CEMENT. See CEMENT

PORTO-RICHE, pōrtō'richē', (GEORGES DE (1849-). A French dramatist (see VOL. XIX), who became a member of the Academy in 1923. His later works were *Le marchand d'estampes* (1917), *Anatomic sentimentale* (1920); *Le passé* (1921); and an unpublished scene taken from the *Marchand d'estampes* (1923).

PORTO RICO. An island possession of the United States in the West Indies with an area of 3435 square miles. The population of Porto Rico increased from 1,118,012 in 1910 to 1,299,809 in 1920, and in 1928 (estimated) to 1,454,000. The distribution in 1920, according to color, was as follows: white, 948,709; black, 49,246; mulatto, 301,816; all others, 38. During the decade 1910-20, the white population increased by 29.5 per cent, while the mulatto population decreased by 10 per cent, and the black by 2 per cent. The chief cities, with their populations in 1920, are San Juan, 71,443; Ponce, 41,912; and Mayaguez, 19,124; 1928 estimates: San Juan, 100,000; Ponce, 46,500; and Mayaguez, 21,000.

Government. The Organic Act of 1917 separated the legislative and executive functions and created an appointive judiciary system and an elective Senate. The chief executive is a governor, appointed by the President of the United States. The Legislature consists of two Houses, the Senate, composed of 19 members, and the House of Representatives, composed of 39 members. A resident commissioner represents Porto Rico in Congress. Six heads of departments form a council to the governor. The Judiciary includes the supreme court, seven district courts

appointed by the governor, and minor courts which also are appointed by the governor.

Agriculture. The number of farms in Porto Rico decreased from 58,371 in 1910 to 41,078 in 1920; the improved land in farms decreased from 1,570,304 to 1,303,547 acres. The value of farm property, however, increased from \$102,378,874 in 1910 to \$179,392,511 in 1920, and the average value per farm increased from \$1754 to \$4367. The production of sugar cane increased from 3,180,750 tons in 1909 to 3,961,984 in 1919. Production of sugar from cane was 748,677 short tons in the fiscal year ending June 30, 1928, the largest output ever produced in the island. The production of tropical fruits has become an important industry in the island. Due to storm damage, the 1928 coffee crop was the lowest in 30 years, exports dropping to 7,800,000 pounds as compared to 26,300,000 in 1925-26. The owners of farms decreased from 46,779 in 1912 to 36,407 in 1920, the number of farm managers increased from 1170 in 1912 to 1213 in 1920, the tenant farmers decreased in number from 10,422 in 1910 to 3458 in 1920. White farmers in 1910 numbered 44,251, compared with 35,194 in 1920; colored farmers decreased in number from 13,850 to 5884. Extensive work in the island is carried on by the U. S. departments of Agriculture and Labor. Seed selection received special attention throughout the decade and experiments resulted in a considerable development of cotton growing. A vigorous campaign was carried on for the elimination of insect pests. The extension of the Federal Loan Act of 1922 was of great value to farmers in Porto Rico. Agricultural conditions after 1919 were particularly favorable to sugar cane, which increased its lead over the crops as a whole. The tobacco industry had a remarkable increase. Only 473 persons were employed in its production in 1913; there were 7272 in 1919, and 11,962 in 1922. In the fiscal year 1928, the tobacco crop was 22,000,000 pounds and the amount exported was valued at \$20,777,937.

Mineral Production. Although gold, silver, iron, copper, and other minerals are found in Porto Rico, there is little mining. Some stone is quarried. The total value of the product of all the quarries in 1919 was \$158,157, compared with \$5459 in 1909, or an increase of nearly 3000 per cent.

Manufactures. Chief among the industries are the manufacture of sugar and sugar products, cigars, fine needlework, women's wear, and men's clothing. The sugar centrals constitute the bulk of the manufacturing of the island, with factories for the manufacture of cigars, cigarettes, and the stripping of tobacco ranking next. The cigar output in 1927-28 was 207,770,413, as compared with 581,548,820 in the peak year of 1919-20, and 207,368,253 in 1906-07. Cigarettes produced in 1927-28 totaled 390,243,600, in 1926-27, 354,453,850; in 1906-07, 358,183,000. The expanding needlework and embroidery industry has become one of the most important, with from 40,000 to 50,000 women and girls employed. Mayaguez is the centre of this industry. Bakery products, food preparations, and printing products also are manufactured.

Transportation. An elaborate system of excellent roads has been perfected. In 1928 there were 1058 miles of macadamized roads. A large part of the transportation of commodities is done by motor trucks over these highways. There were 339 miles of railroad on the island. In 1926

there were 1072 miles of telegraph wire, 27,745 miles of telephone wire, and 13,374 instruments. Important improvements were made in San Juan Harbor, where a reinforced concrete bulkhead was built along the entire waterfront. Streets leading to the harbor were paved and made suitable for the heavy transportation. The pier at Ponce was completed and placed in use in 1914. In 1920 provision was made for the construction of a large new pier in San Juan Harbor and the expansion of the bulkhead. The harbor was also dredged, to provide navigation by the largest vessels.

Education. After the island became a territory of the United States, the Government of Porto Rico had used the utmost efforts toward the education of the people, especially the children. These efforts have been well received by the people and the results have been extremely favorable. The average daily attendance in all the public schools increased from 155,830 in 1914 to 184,991 in 1920, but was 182,365 in 1925-26. In 1928, of a total enrollment of 220,940 pupils, 127,930 pupils were enrolled in rural schools and 92,873 in urban schools. In addition, there were 7365 pupils in private schools. The total number in public and private schools was 228,305.

At the time of the American occupation, 80 per cent of the population was found to be illiterate. This proportion was reduced in 1910 to 66 per cent and in 1920 to 55 per cent. In 1899 only 8 per cent of the persons 5 to 17 years of age were attending school; in 1920 over 45 per cent were reported in school. Special attention is given to practical instruction in agriculture. During the first decade of American occupancy, 950 rural schools were established; there were 1700 in 1920 and 2144 in 1928. Industrial education also received adequate attention. In 1914 manual training for boys and household economics for girls were made obligatory for students in grades 6 to 10 in the public schools, in towns where the attendance warranted the installation of the necessary apparatus.

The importance of placing education within the reach of a large number of illiterate adults was early recognized and for their benefit night schools were established. In 1914 an average of 825 such schools were maintained, and this number had greatly increased in 1928. Instruction in hygiene and health preservation was established and strengthened. Dental clinics were established in many schools and general health clinics were started and medical inspection in rural schools was begun. The total expenditure for educational purposes in 1928 was \$5,834,467, of which \$1,505,576 was supplied by the municipalities and \$4,328,890 by the Department of Education.

Facilities for higher education were provided by the University of Porto Rico and by the College of Agriculture and Mechanic Arts at Mayaguez. The university consists of a college of liberal arts, college of law, college of pharmacy, normal school, and high-school division. The number of students enrolled in 1922-23 was 1477, and in 1927-28, 3404.

Trade and Commerce. The remarkable commercial expansion of Porto Rico is shown by a comparison of trade figures. In 1913-14 the combined value of imports and exports was \$79,509,549, in 1927-28, it was \$195,877,068. The merchandise shipped from Porto Rico to the United States in 1913-14 was valued at \$34,423,180; in 1927-28 it was \$96,662,619. The imports

from the United States in 1914 were valued at \$32,568,368, and in 1927-28, \$79,743,088. The chief exports are sugar, cigars and cigarettes, tobacco leaf, and coffee. The exports of sugar increased from 320,633 tons, valued at \$20,240,335 in 1914, to 605,620 short tons, valued at \$54,579,000 in 1927-28. There were exported in 1914, 150,363,991 cigars and 144,378,000 in 1928. The tobacco leaf and scrap exported in 1914 was valued at \$3,206,610, and in 1928, at \$17,074,560. The coffee exports in 1914 were valued at \$8,193,544 and in 1928 at \$2,596,872. The exports of fruit, including oranges, pineapples, coconuts, and grapefruit, were valued in 1914 at \$3,400,903, and in 1928 at \$7,538,794. During the American occupation, there was a rapid growth of trade with the United States. During the years covered by this occupation, the value of imports from all foreign countries increased from only 3 to 13 million dollars, while the value of purchases from the United States increased from 6 to 121 million dollars in 1920, and then fell to \$81,981,000 in 1928. The value of exports from Porto Rico to all foreign countries increased from 3 to 7 million dollars, while the value of Porto Rican shipments to the United States increased from 3 to 158 million dollars in 1920. In 1928 exports to the United States amounted to \$97,269,000. More than 90 per cent of all the external commerce of the island was with the United States. Porto Rico has had a favorable trade balance in all except 4 of the last 30 years. Imports in 1927-28 totaled \$92,342,329 and exports, \$103,534,739. The figures for 1926-27 were imports, \$98,810,750, exports, \$108,067,434.

Finance. There occurred soon after 1913 a severe financial crisis caused by the fact that laws passed by the Legislature to provide sums for public improvements failed to attain the results expected. The result was a large deficit. Prompt measures were taken to avert disaster and the legislative assembly in 1914 passed laws to meet the situation. All forms of expenditure upon public improvements were suspended and provision was made for an issue of \$1,000,000 of bonds. The severe hurricane of 1928 again disturbed the fiscal situation. Total revenue receipts for 1927-28 were \$12,446,219 and non-revenue receipts, \$2,968,335, or a total of \$15,414,554. Total expenditures were \$14,784,013. The receipts for the fiscal year 1922-23 were \$10,118,891 and the expenditures, \$10,801,640. The bonded indebtedness in 1913-14 was \$5,925,000. On June 30, 1928, it stood at \$25,517,000.

Health and Sanitation. The sanitation service on the island was organized in 1913 under a law passed in 1912, and year after year successively vigorous and successful work was carried on by this service. Successful efforts also were made, in particular, to promote the building, in various cities and towns, of modern aqueducts for a supply of pure water, for sewer systems, for sanitary slaughterhouses and meat markets, and for clean dairies. Great improvement also was made in the proper construction and plumbing of dwelling houses. The work of eradicating the hookworm, which was so prevalent in the island that over 90 per cent of the laboring people were infected, was undertaken. The Insular Health Service and the Rockefeller Foundation cooperated for the eradication of the disease with remarkable success. By 1923 approximately one-sixth of the rural population of the island had received treatment. Tuberculosis is the chief menace to the health of the people. The percentage in pro-

portion to general mortality increased from 7.28 in 1914 to 12.1 in 1928. Every effort was being made to eliminate conditions favorable to this disease. Malaria ranks third in mortality records. In 1923 arrangements were made by which the Rockefeller Foundation united with the insular authorities in an intensive campaign for mosquito and malaria control. The death rate increased from 18.6 per thousand in 1913 to 23.3 per thousand in 1926-27. In 1927-28 it was 20.4. The death rate for 1913 was the lowest then recorded on the island. For 1912 it was 24.02. A leper colony was maintained at Trujillo Alto in the interior of the island. In 1910 a service was instituted in the island for the study and prevention of tropical and transmissible diseases and in 1920 the Legislature created an institute of tropical medicine and hygiene. Twenty-five public-health dispensaries have recently been established. The hurricane of September, 1928, threatened great damage to public health through homelessness and privation, but these conditions were successfully met, largely by the action of the insular health organizations.

History. The most important event in the political history of Porto Rico after its passing under American control was the passage by Congress, in 1917, of a new Organic Act, providing for the government of the island. Business conditions in Porto Rico were greatly affected by the tariff law passed in 1913. More important than this, however, was the serious decline in the sugar industry in 1914, owing to local and general conditions. In 1915, because of a lack of co-operation between the two Houses of the Legislature, comparatively little important legislation was enacted. The Legislature of 1916 passed several important measures relating to revenue and taxation. On Mar. 2, 1917, President Wilson approved the Organic Act for Porto Rico. This was received everywhere with great satisfaction. The people were especially pleased with the granting of American citizenship. With the entrance of the United States into the World War, many new problems arose in Porto Rico. The price of foodstuffs, already abnormally high, rose sharply. A food commission with wide powers was appointed. The compulsory military-service law applied to Porto Rico, which showed a strong feeling of patriotism and loyalty. After Mar. 2, 1918, the prohibition of all alcoholic beverages went into effect. A destructive earthquake occurred in October, 1918. The heaviest losses were at Mayaguez and Aguadilla. About 150 lives were lost and the damage to government works and public buildings was over \$1,000,000. A great sea wave followed the earthquake and increased the loss, especially at Aguadilla. The Legislature in 1918-19 passed a new election law changing the methods and machinery of election, a new municipal law, providing for a larger degree of self-government, a grand-jury law, several labor laws, and a measure establishing a minimum wage. The year 1920 was one of unusual prosperity and progress, although there were several strikes during the year in the sugarcane fields and among the dock workers. In spite of these disturbances, the general prosperity of the island increased greatly. A special session of the Legislature, on Apr. 26, 1920, passed an important amendment to the tax laws. It also amended the excise laws, the election law, the municipal law, and the workmen's-compensation law. An act was passed authorizing coöperative societies of production and consumption. E.

Mont Reily was appointed governor by President Harding in July, 1921, succeeding A. M. Yager, who had occupied that post since 1913. Following the inauguration of Governor Reily, the aggressive attitude adopted by him toward the political leaders of the island at once created a situation of great difficulty. The Unionist Party was accused by supporters of Governor Reily of aiming at secession from the United States. This party was the most powerful of the political bodies of the island and was headed by Antonio R. Barcelo, president of the Senate. The leaders of this party were charged by Governor Reily with sedition and he administered a severe rebuke to Señor Barcelo, who resigned from the leadership but was obliged to resume it on account of the insistence of his supporters. The Governor dismissed several high officials and replaced them with Republican successors. In this, he was severely criticized. By the end of the year, a majority of both the Lower and Upper Houses petitioned President Harding for the removal of Governor Reily. The President took no action, but Governor Reily resigned on Apr. 1, 1923. He was succeeded by Horace Towner, under whose administration political difficulties subsided. Governor Towner resigned in 1929 and Colonel Theodore Roosevelt was appointed by President Hoover to succeed him. There remained a feeling of dissatisfaction with Porto Rico's status, which eventually took the form of agitation for statehood. The Legislature addressed to the Government of the United States in January, 1928, a request that the island be made a State. In a letter to Governor Towner, President Coolidge made an adverse reply. On Sept. 13, 1928, a hurricane swept the island, taking over 200 lives, rendering some 400,000 persons homeless, and ruining crops, particularly the coffee crop; damage was estimated at \$85,000,000.

PORTUGAL. A republic of western Europe with an area, including the Azores and Madeira islands, of 35,490 square miles, and a population in 1920 of 6,032,991, or 169.9 per square mile. The 1911 population was 5,957,985. The chief towns, with their populations in 1920 and 1925 are Lisbon, the capital, 489,607 (529,524 in 1925), Oporto, 203,199 (215,625 in 1925), Setubal, 37,074, Braga, 21,970. Emigration continues to keep the population almost stationary; 39,837 natives left the country in 1926 of whom 29,948 went to Brazil, 170 to North America, and 6810 to European countries. In spite of frequent governmental decrees, education has made no perceptible advances. The number of primary and of secondary schools in 1920 showed little increase over those recorded in 1911. In 1926-27 there were 7174 public elementary schools with 318,437 pupils and 8384 teachers, 33 secondary schools with 11,430 pupils and 935 teachers, and 5 primary normal schools with 793 pupils and 85 teachers. There are three universities, Lisbon (founded 1858), Coimbra (founded 1920), and Oporto. Seventy-five per cent of the population is believed to be illiterate.

Industry and Trade. After 1902, when the last census of agriculture was reported, the state of agriculture declined, being handicapped by lack of transport facilities and of efficient use of fertilizers. In the earlier years, 34.9 per cent of the total area was devoted to tillage; of late (1927) this had dropped to 26 per cent. The yield of wine, one of the most important activities, dropped from 6,869,400 hectoliters in 1908 to 4,392,780 hectoliters in 1919, but had risen to

7,975,000 hectoliters in 1927. The cereal crops cultivated, i.e., rye, wheat, corn, are for home consumption and the fattening of stock. Articles that entered into the trade of the country, indicating a certain amount of application, are cork, olive oil, raw wool, hides, sardines, and wine. Trade in 1913 was: imports, \$82,025,000, exports, \$32,767; in 1920, \$134,675,000 and \$43,297,000; in 1926, \$120,156,000 and \$37,419,000. In 1913, 10,638 vessels of 24,368,120 tons entered Portuguese ports; in 1917, 5860 vessels of 4,906,599 tons entered; in 1920 (the best post-armistice year), 9909 vessels of 16,101,695 tons entered; in 1927, 8929 vessels of 24,703,103 tons. During and after the World War, the general economic conditions reflected the prevailing social and political unrest. Raw materials could be obtained only with difficulty—the shortage of cotton, gasoline, tin plate, and coal being particularly severe—and factories and mines had to suspend operations. Only the activities of the colonies succeeded in keeping the home industries active, for the raw materials imported made up in part for the decline of the foreign trade.

Communications. In 1913 there were 1854 miles of railway in operation; in 1926, 2005 miles, of which 824 miles were state owned. The continued steady depreciation of equipment and the falling off of traffic increased the obligations of the systems. Several sections of the state-owned lines have been taken over for operation by the company operating a number of private lines.

Finance. The budget for 1914–15 called for revenues of 79,649,140 escudos and expenditures (ordinary and extraordinary) of 83,390,965 escudos. The 1922–23 budget included revenue estimates of 276,137,853 and expenditures of 561,326,125 escudos. That for 1928–29 provided total receipts of 1,919,388,375 and total expenditures of 1,917,811,677,000 escudos. The debt on July 1, 1926, consisted of internal funded debt, without that held by the Government, \$62,676,000; the internal floating debt, \$86,165,000, external funded debt, \$160,716,000; external floating debt, \$116,397,000. The unit of currency is the escudo which has a par value of \$1.0805. The exchange value in 1913 was \$0.9274; by 1927 it had dropped to \$0.0503, in 1928 it was \$0.045.

History. Portugal's history from 1914 to 1929 was a continuous change of administrations accompanied by crises of lesser or greater importance. The great gulf existing between political leaders and the people at large was perceptible as ministries rose and fell amid a general indifference. The increasing illiteracy, the steady emigration of the peasantry to the New World, and the lack of capital for new enterprises, all accounted for the general stagnation. The violent break between church and state, which had been one of the first works of the revolution, was considerably tempered by conversations resumed by President Paes with the Vatican in 1918. In 1919 a papal nuncio was appointed to Portugal, and in 1920 the Pope expressed himself as satisfied with the improved conditions.

Portugal's traditional friendliness with England, her dependence on the latter for heavy importations of wheat and coal, and the fear entertained for the safety of the African colonies, led Portugal to affirm her obligations under the British Treaty, in November, 1914. Troops were immediately despatched to Africa and contingents were sent throughout the War, 40,000 men seeing service in this area. In 1916 Portu-

guese troops entered the Kionga triangle and thus restored to their country a territory that had been seized by Germany in 1894. In 1916 German ships lying in Portuguese waters were seized (240,000 tons); Germany retaliated by formally declaring war on Mar. 9, 1916, and opening a severe submarine attack on shipping and ports. In 1917 shipping losses were particularly heavy. Portuguese contingents saw action on the western front in 1918, in all, 60,000 men taking part. At the Peace Congress, Portugal was represented, first by Dr. Egas Moniz, and later by Dr. Afonso Costa. Subsequent meetings of the Supreme Council restored the Kionga triangle to Mozambique and allotted Portugal 0.75 per cent of the German indemnity.

Portugal's participation in the War did not check internal disorders. In 1915 a mutiny of sailors resulted in the bombardment of Lisbon and the killing of 100 persons; Sr. Pimenta de Castro, the Prime Minister, was transported to the Azores; his successor was shot at, and resigned soon after; and this was followed immediately by the resignation of President Arriaga. These events were a prelude to the greater events of 1917. In December of that year, a revolution broke out in Lisbon and the fleet was fired upon. The purposes of the revolutionaries were for a more active participation in the War, and the resignation of the Government which had antagonized the conservative classes. The result was the deportation of President Machado, the arrest of the Premier, Dr. Afonso Costa, and the selection as provisional President of Maj. Sidonio Paes, leader of the revolt. On Apr. 28, 1918, Sr. Paes was elected by direct suffrage as President, though the Republican parties refused to participate. By the support of the Catholics, whom he immediately propitiated, and the conservative elements, his powers at once became dictatorial. Parliamentary ministers were transformed into secretaries responsible to the President; all efforts were bent on the prosecution of the War, to the great approval of the Allies; but Sr. Paes, who might have restored Portugal to something like stability, was assassinated on Dec. 14, 1918, and the country was once more in a state of turbulence.

In 1919 the uncertainty was capitalized by the monarchists who proclaimed a monarchy at Oporto under the regency of Captain Conceiro. The general rising of the marines and the radical elements made the royalist revolution short-lived, so that after a few weeks of desultory fighting, Captain Conceiro was captured and the civil war ended. Ministry followed ministry in rapid succession. Admiral Canto e Castro, having followed Paes in the Presidency, resigned in 1919; he was followed by Dr. José de Almeida. The railroad strike of 1920 embarrassed the Government; the failure to cope with the pressing internal problems of taxation, the currency, public works, served to render the existing machinery useless. The counsel of former King Manuel to his followers, in 1920, to give up violence and resort to constitutional tactics only, had little influence on affairs. During 1921 Sr. Granjo, the Prime Minister, was killed as the result of another outbreak in Lisbon; and bomb outrages were frequent in 1921 and 1922.

After eight ministries had held office for brief terms in 1922, a cabinet formed by Antonio da Silva contrived to exist for over a year and a half, despite sporadic bomb-throwing, strikes, and rioting. Teixeira Gomes, elected President

in August, 1923, was inaugurated in October to the accompaniment of a fruitless revolution fomented by his adversaries. Following da Silva's resignation in November, there commenced a new cycle of short-lived governments. Dr. Genestal Machado served as Premier from November 15 to December 13. He was succeeded by Col. Alvaro de Castro, who abolished about 2500 official posts, reduced the budgetary deficit somewhat, but dealt a staggering blow to Portuguese credit by decreeing (Feb. 11, 1924) that since the escudo continued to depreciate the interest on public securities would be paid in paper money rather than in gold, as had been promised. A generally unpopular financial policy led to the overthrow of the Castro cabinet in June, 1924. A new government under Rodriguez Gaspard survived until November, notwithstanding various Communist disorders, military mutinies and industrial disputes. Then, a ministry headed by Domimique dos Santos proclaimed a programme of "Liberty, bread, education," but after a few progressive steps had been taken, its existence was summarily terminated in February, 1925, when a bomb outrage and other incidents set the political pot boiling.

The spectre of revolution constantly menaced the next government under Premier Victorino Gouveia. Minor insurrections in March were followed by a more serious though unsuccessful revolt in April, which aimed to replace the existing civil régime with a military dictatorship. Lack of parliamentary support compelled the Gouveia cabinet to resign (June 26), whereupon Antonio da Silva held the reins for the ensuing month and managed to suppress a new revolutionary outbreak just prior to his supersession by Dominjo Pereira. A parliamentary election in November, 1925, caused no special excitement and registered no significant change.

In December, President Gomes resigned because of ill health, and Dr. Bernardina Machado, a former incumbent who had been exiled in 1917, was elected to succeed him. Simultaneously, the Perena cabinet resigned and Antonio da Silva resumed control. An unsavory bank scandal in Angola, another revolutionary upheaval during February, 1926, projected constitutional revision, parliamentary debates on the customary budgetary deficit, and popular opposition to a renewal of the state tobacco monopoly, which expired April 30, were symptomatic of the prevailing political unrest.

Late in May, 1926, a bloodless military *coup d'état* overthrew the da Silva ministry. President Machado resigned June 1 and control of the government was assumed by a triumvirate consisting of Naval Commander Mendes Cabecadas, General Manuel Gomes da Costa, and Major Arnando da Lama Ochoa, the first named becoming Premier. The revolutionists declared that they merely wished to set up a more democratic form of government and to rid the country of professional politicians. Friction speedily developed, however, and on June 17, General da Costa entered Lisbon in triumph at the head of the army, compelled Cabecadas and his adherents to resign, and by an official decree of June 27 installed himself as supreme ruler; but ministerial disputes coupled with widespread dissatisfaction in the army because of his failure to carry out his announced programme of reform led to the speedy downfall of da Costa. On July 9, he was arrested by a former colleague, General Antonio Oscar de Fragozo Carmona, who now seized

power and organized a new cabinet with himself as Premier. General da Costa was sent into temporary exile, but some months later was made a Marshal of Portugal and eventually allowed to return. On Nov. 29, 1926, Carmona extra-legally assumed the Presidency. Early in 1927, most of the factions opposed to the dictatorship issued a manifesto to the foreign legations stating that when they came into power they would not recognize any foreign loans contracted by General Carmona's government. Carmona promptly took steps in reprisal which helped precipitate a formidable military revolt under General Souza Diaz. Violent fighting took place at Oporto and Lisbon with heavy casualties, but by drastic measures the Government crushed the insurgents and restored "law and order." In August, 1927, Carmona displayed personal courage in foiling an armed attack when several officers invaded his home during a cabinet meeting to demand that the Government resign.

In the face of some bitter criticism, a presidential "election" was arranged for Mar. 25, 1928, to legalize the provisional régime of the dictator. Regulations were promulgated to ensure a satisfactory outcome, and, as predicted, General Carmona, the only candidate, was elected. The cabinet was then reconstituted with Col. Vicente Freitas as Prime Minister and with some changes held office until July, 1929. Parliament had ceased to exist. Meanwhile, the League of Nations had been requested to sponsor a \$60,000,000 loan for the financial rehabilitation of Portugal, but after an investigation (beginning February, 1928) it proposed conditions which the Portuguese government felt unable to accept and the project fell through. During 1929 there was somewhat widespread complaint about burdensome taxation, but the Carmona régime appeared to be fairly firmly entrenched. The national budget showed a surplus of \$400,000 according to the dictatorship and provision was being made for continued improvement of public works. Portugal's war debt to Great Britain had been funded by an agreement negotiated in December, 1926.

PORTUGUESE EAST AFRICA, or **MOZAMBIQUE**. A Portuguese colony on the east coast of Africa with an area of 428,132 square miles and an estimated population of 3,657,008. In 1919 the Supreme Council awarded the province an area of 400 square miles, formerly part of German East Africa, known as the Kionga triangle. Capital of Province of Mozambique, Lourenço Marques, had a population of 37,301, Dec. 29, 1927. Sugar, coconut palm, and sisal areas have increased, particularly in the districts controlled by the Mozambique Company. Other products are rubber, ivory, wax, and various ores. The trade figures for 1913 and 1927 were, in escudos: imports, 12,678,000 and 57,260,765; exports, 5,346,000 and 56,905,087. Most of the transit trade was handled through the port of Lourenço Marques, at which 774 vessels of 3,693,320 tons entered in 1927. In 1913-14, the budget balanced at 5,878,598 escudos; in 1928-29, 322,483,961 escudos, estimated. (One escudo = \$1.08 at par.) After 1913, the railway building was active due to the interest manifested by the British South African provinces because of their desire to utilize the Territory's ports. Some 160 miles along the route from Delagoa Bay to Inhambane were completed; a line 156 miles long from Beira to the Zambezi was opened for traffic in 1922. The position of

Portuguese East Africa became increasingly important after 1909, because the province served as the nearest outlet for the British South African products to the sea. Delagoa Bay in particular, being 100 miles nearer to Johannesburg than Durban, was favored, and the commercial facilities and social amenities of its city, Lourenço Marques, showed continual improvement. Coal-bunkering plants were erected, as well as large wharves and docks. Through Delagoa Bay went much of the Transvaal's coal, copper, tin, asbestos, and maize. Shipping after 1914 was mainly in British and Portuguese hands. This economic relationship between the province and the British colonies accounted for the attention which Portuguese East Africa has received from the home administration. The natives were subjugated and turbulent areas pacified, and Portuguese capital was invited to aid in the province's exploitation. The result of the War put an end to the attempts of the German-controlled Nyasa Company to dominate the province. Great Britain, of course, then became the paramount factor.

Due to active and developing trade and their close propinquity, differences developed between Mozambique and the Union of South Africa. For a number of years, the two countries lived under a *modus vivendi* which it was desired to replace by a definite commercial treaty. The underlying questions concerned the Lourenço Marques Railway, the employment of Mozambique natives in the Rand Mines, and commercial relations generally. In 1927 it was announced that negotiations which had been under way had broken down and notice was given that on June 1, 1928, the labor agreement was to be terminated by Portuguese East Africa. On May 13, 1928, however, an agreement was reached and later in the year a draft convention was signed at Lisbon. This was followed by a final agreement signed at Pretoria on Sept. 11, 1928, dealing with the question of recruiting native labor for the mines, regulating customs, dues, and charges on shipments through Lourenço Marques, and stipulating the portion of tonnage to be assured to that port by the Government of the Union of South Africa.

POSITION INDICATOR. See ELECTRIC MOTORS IN INDUSTRY.

POSTGATE, JOHN PERCIVAL (1853-1926). An English classical scholar (see VOL. XIX), professor of Latin at Liverpool University (1909-20), then professor emeritus. He served as president of the Philological Society (1922-25) and of the Classical Association (1924-25), and was a fellow of the British Academy. Besides numerous articles in journals, he wrote *Lucan*, book viii, text and commentary (1917); *New Latin Primer* (1918); critical edition of *Phaedrus' Fables* (1922); *Translation and Translations* (1922); *Prosodia Latina* (1923); and *Guide to Greek Accentuation* (1924).

POTASH. See FERTILIZERS.

POTATOES. The average annual production of potatoes in the United States, 1919-28, was 392,219,000 bushels. The largest planting, 4,384,000 acres, was harvested in 1917; and the largest yield, 462,943,000 bushels, was secured in 1928. Beginning with 1914, potato culture increased in the northern Mississippi Valley, especially in Minnesota and North Dakota; and

several localities, particularly in western Nebraska, Idaho, and Colorado, became prominent in the production of the crop. Latterly, the production of early potatoes, marketed about May 1, has become an important enterprise in Florida. The growing of certified potatoes for seed also became an established industry, with an increasing annual production of such potatoes in a number of States and in Canada. In 1924 the production in the United States was 7,474,637 bushels, the highest on record. Certified potatoes are grown and inspected under rules and regulations for eligibility to certification. The requirements generally are freedom from varietal mixtures, conformity of tubers to the accepted type for the variety in shape, color, size, and characteristic markings; a fair degree of uniformity in size, and freedom from disease. During the World War, limited supplies and unsettled conditions led to the subjection of the international trade in potatoes to governmental regulation in many countries. In the United States, all large potato dealers were under license to the Food Administration, and standard grades recommended by the Food Administration and the Department of Agriculture were prescribed from Jan. 31 to Dec. 10, 1918. Use of the grades proved so satisfactory that it was continued voluntarily, and many States later passed laws establishing these or very similar grades as their official standards. As revised and effective June 30, 1927, the United States grades for potatoes comprise U. S. Fancy, U. S. No 1, U. S. No 2. These ratings are based on size, shape, uniformity, and the general absence of defective stock. In 1921 and 1922, low prices and high freight rates reduced shipments from many sections producing potatoes commercially, and these conditions added materially to the financial distress which befell farmers in the years following the War.

The potato diseases known as hopperburn (or tipburn), spindling sprout, late blight, and mosaic are among the most injurious. Hopperburn, spread by the potato leaf hopper, is a blighting and drying up of the leaves during hot and dry seasons, spindling sprout is a production of weak and threadlike sprouts; late blight is a total blighting of the stems and leaves during the later period of growth, and mosaic, long known in Europe, is a disease showing mottling of the leaflets with patches of light green. The introduction of the Colorado potato beetle, reported from France and Belgium, was regarded as resulting from wartime intercourse. Consult William Stuart, *The Potato: Its Culture, Uses, History, and Classification* (Philadelphia and London, 1923); U. S. Department of Agriculture *Yearbook* for 1925 and 1927.

POUND, EZRA (1885-). An English poet and translator who was born in the United States (see VOL. XIX) and was a follower of Confucius and Ovid. As literary executor for Ernest Fenollosa, he worked on Chinese and Japanese poetry, and on the Noh drama of Japan. He was London editor of *The Little Review* (1917-19). He wrote the music of an opera, *Le Testament*, which had a partial performance in Paris in 1926. His later poems were *Lustra and Other Poems* (1917); *Quia Pauper Amavi* (1919); *Umbra*, a collection of early poems (1920); *Hugh Selwyn Mauberley* (1920); and *Selected Poems*

(1928). His later prose works included *Gaudier Brzeska* (1916); *Pavannes and Divisions* (1918); *Instigations* (1920); *Indagretions* (1923); and *The Ta Hio*, American version (1928). He translated *Certain Noble Plays of Japan*, from the Fenollosa manuscripts (1916); *Noh, or Accomplishment* (1917); *Twelve Dialogues of Fontanelle* (1917); and edited a *Catholic Anthology* (1915); and the *Letters of John Butler Yeats* (1917).

POUND, ROSCOE (1870–). An American lawyer and educator (see VOL. XIX). From 1913 he was Carter professor of jurisprudence and from 1916, dean of the law school at Harvard University. He was one of the 10 members of the National Law Enforcement Commission appointed by President Hoover May 20, 1929, and was granted a leave of absence from Harvard to pursue this work. He wrote *Lectures on the Philosophy of Free Masonry* (1915); *The Spirit of the Common Law* (1921); *Criminal Justice in the American City* (1922); *Introduction to the Philosophy of Law* (1922); *Interpretation of Legal History* (1923); *Law and Morals* (1924–26).

POWDER, SMOKELESS. See EXPLOSIVES.

POWELL, E. ALEXANDER (1879–). An American author and war correspondent, born at Syracuse, N. Y., and educated at Syracuse University and Oberlin College. During the World War, he was correspondent for daily papers in New York and London and for *Scribner's Magazine*, and served with distinction in the Army. His books include: *The Last Frontier* (1912); *Gentlemen Rovers* (1913); *Fighting in Flanders* (1914); *Italy at War* (1917); *The Army Behind the Army* (1919); *The New Frontier of Freedom* (1920); *Asia at the Crossroads* (1922); *By Camel and Car to the Peacock Throne* (1923); *The Struggle for Power in Moslem Asia* (1923); *Beyond the Utmost Purple Rim* (1925); *The Map That Is Half Unrolled* (1925); *In Barbary* (1926); *A Virginia Pilgrimage* (1927); *Embattled Borders* (1928).

POWELL, JOHN (1882–). An American pianist and composer, born at Richmond, Va., and educated in music in Vienna, where he studied from 1902 to 1907 with Leschetizky (piano) and Navrátil (composition). After his pianistic debut in Berlin (1908), he played in Vienna, London, and Paris. In 1912 he returned to his native country and made his American debut in New York. He later made frequent appearances, chiefly as interpreter of his own works. While his compositions have titles suggesting classical forms, the contents and treatment are very free, so that the works give the impression of being improvised rather than logically developed. For his thematic material, he made extensive use of Negro melodies harmonized in the most modern fashion. His works comprise a concerto for piano and orchestra; a violin concerto; an overture, *In Old Virginia*; *Rhapsodic Nègre*, for piano and orchestra; and a string quartet. His piano works, almost exclusively in cyclical forms, include four sonatas *Virginianesque*, *Psychologique*, *Noble*, *Teutonic*, and two suites, *In the South* and *At the Fair*.

POWER, FREDERICK BELDING (1853–1927). An American chemist, born at Hudson, N. Y., and educated at the Philadelphia College of Pharmacy and in Strassburg. During 1880–83 he had charge of the chemical laboratories of the Philadelphia College of Pharmacy and during

1883–92 was professor of pharmaceutical chemistry and materia medica at the University of Wisconsin. In 1916 he was given charge of the phytochemical laboratory of the Chemical Bureau of the U. S. Department of Agriculture. His original researches were in connection with phytochemistry and with essential and fatty oils, especially the development of chaulmoogra oil as a remedy for leprosy. In addition to writing many scientific papers, he was associated with F. Hoffman in the publication of the *Manual of Chemical Analysis* (1883).

POWER PLANTS. The importance of power as a factor in American industry is shown by the fact that in 1869 there was employed only 114 horse power per wage earner. By 1889 this had increased to 14; in 1919 it was 324 and in 1928 it had reached 47 horse power, an increase of 45 per cent during the last nine years. Approximately three-fourths of the machinery in American mills and factories is now motor-driven. These figures represent nearly twice the power per worker in Great Britain, over three times that in France, eight times that in Japan, and thirty times that in China.

According to the Industrial Census of the United States of 1927, the total installed primary horse power employed in manufacturing is over 39,000,000. Of this, over 18,000,000 horse power is supplied by central stations and the remainder privately generated. The difference between this and the total central station capacity represents that used for nonindustrial purposes. To this should be added between 3,000,000 and 4,000,000 horse power installed in nonindustrial buildings. Since 1914 central station power has increased at a much greater rate than private generating plants, growth among the latter now being confined mostly to the larger plants and those in industries requiring exhaust steam for process uses. At present, many of the private plants are going to relatively high steam pressures of around 400 pounds, a few have gone to 800 1000 pounds, and one to 1800 pounds. There is also a trend among many of the larger plants to purchase part of their power and generate part to the extent of balancing process-steam demands. Interchange of power between central stations and large industrial plants has likewise gained headway in many sections.

The total installed capacity of central stations in the United States at the end of 1928 was over 31,000,000 kilowatts (42,000,000 horse power), representing an investment in plants and equipment of approximately \$10,000,000,000. In 1928 there were generated over 88,000,000,000 kilowatt-hours of which over 40 per cent was supplied by water power and the remainder mostly by steam. Internal-combustion engines accounted for only a very small part of central station power.

Despite increased costs in nearly every line since the World War, electric rates have steadily declined. This has been made possible through increased efficiencies in the production of electricity. In 1919 the average consumption of coal per kilowatt-hour was 32 pounds, and by 1928 this had been reduced to 1.7 pounds, with several individual plants doing better than a kilowatt-hour on a pound of coal. Extensive interconnections of power systems have made possible further operating economies and reduced the investment tied up in reserve capacity.

The accompanying table showing prime mover capacity of central stations was based on research

PRIME MOVER CAPACITY OF CENTRAL STATIONS IN THE UNITED STATES

Year	Prime Mover Capacity as of Jan. 1, h. p.	Hydro electric Prime Movers, h. p.	Fuel-plant Prime Movers, h. p.
<i>United States</i>			
1922	22,023,000	6,251,000	15,772,000

1929	5,234,000	3,339,000	1,895,000

studies made by the *Electrical World* and data collected by the U. S. Geological Survey and U. S. Census Bureau. All figures as of Jan. 1, 1929. Generating plants of electric light and power companies, electric railways, Bureau of Reclamation, and those manufacturing companies selling energy for public utility use are included.

The trend in American central-station practice has been toward higher steam pressures, larger boiler and turbine units, and interconnection of systems. Among those responsible for the design of the more recent stations, there are three groups, those favoring 400 pounds steam pressure, those who believe that 600 to 700 pounds represent the most economical pressure and those favoring 1200 to 1400 pounds. The newer stations are about equally divided among these classes. There were in 1928 three 1200- to 1400-pound stations in operation (Edgar near Boston, Lakeside at Milwaukee, and Northeast at Kansas City). Two more (one at Deepwater, N. J. and the other at Holland, N. J.) were nearing completion, and a sixth, at San Francisco, was under construction.

In the industrial-plant field, steam pressures of 400 pounds are common, a few are operating at 600 pounds, one at 1000 pounds and one, the Philip Carey plant, Cincinnati, will employ 1800 pounds pressure. Single-boiler units are now in operation that supply regularly over 500,000 pounds of steam per hour and others are on order capable of supplying 850,000 pounds of steam per hour. Several turbine units of 160,000-kilowatt capacity have recently been installed and one of 200,000 kilowatts will soon be in operation.

While advancement in Europe has been slower from the standpoint of electricity supply, many countries are now devoting much attention to better utilization of fuels, higher efficiencies, and adequate supply with a realization that more power in industry is the key to national prosperity and better conditions. Individually, several countries, notably Germany, Belgium, and Switzerland, have made many advances in power generation, especially in the utilization of higher steam pressure, higher temperatures, and the development of materials to meet the demands of these new conditions. Italy, having no native coal, has set out to develop her water powers on an extensive scale.

European conditions in general are not conducive to such large systems and stations as in the United States, hence, the generating units are of smaller capacity. An exception to this is to be found in the Klingenberg Station near Berlin, which is designed for an ultimate capacity of over 500,000 kilowatts and now has three turbines of 80,000 kilowatts. Germany has also gone in strongly for high steam pressures. A number of plants (mostly of smaller capacity) are operating at over 800 pounds and there are two Benson boilers in service at 3200 pounds per square inch. Steam is reduced to 2400 pounds, super-heated to 840° F., and used for process after passing through a steam turbine.

Europe has lead the United States in higher steam temperatures with a number of plants operating at over 800° F., although there are signs of higher temperatures in American practice. See ELECTRIC POWER STATIONS AND GENERATING APPARATUS; WATER POWER; STEAM TURBINES.

PRAGUE, *prăg*. The capital of Czechoslovakia. The population at the census of 1921 was 676,657. On Jan. 1, 1922, Greater Prague was created by the incorporation of 38 sur-

rounding townships. The city was divided into 13 administrative districts and 19 divisions. The population was increased to approximately 750,000.

The municipal government of Prague is in the hands of a mayor, communal assembly, communal council, the committees, particularly the finance committee, and a communal board of magistrates. The communal assembly, consisting of 100 members, passes on all the more important matters concerning the commune; while the communal council, consisting of 24 members, conducts the administration. The mayor, who is elected by the assembly from their number, presides over both bodies, prepares and carries into effect their resolutions, represents the commune in its dealings with outside bodies, and with two members of the communal council forms the communal board of magistrates. The mayor's appointment is confirmed by the President of the Republic. He is assisted by three deputy mayors. The seat of the local government is Municipal House, erected between 1903 and 1911 on the site of a one-time royal palace. It contains magnificent halls filled with sculpture and paintings by Czech artists. The largest one, the Smetana Hall, is used for concerts and was the place of assembly of the National Committee which in October, 1918, proclaimed Czechoslovakia an independent state.

Since 1918 the Castle of Prague has been the residence of the President of the Republic and the seat of different departments, such as the civil and military. Numerous excavations which have been made in the courtyards of the Castle, under the direction of the Archaeological Institute of Prague, give an interesting history of the successive periods of its construction. There also have been discovered remnants of fortifications dating from the early Middle Ages, two Roman towers of the twelfth century, in the centre of the third courtyard a Roman church of unknown date, a connecting passage to the Cathedral of St. Vitus with a Roman crypt, and at the deepest level, Roman wooden buildings which date from the ninth century. Other departments of the Government are housed in famous buildings. The Thun Palace, in which the dethronement of the House of Hapsburg was proclaimed in November, 1918, has been occupied since 1919 by the Senate of the Czechoslovak Republic. The Ministry of Foreign Affairs is housed in the Černín Palace, which is the largest in Prague, and the Ministry of Finance in the former monastery connected with the Church of St. Joseph. The meetings of the Bohemian Diet, established in accordance with the administrative reforms of 1927, were to be held in the seventeenth-century building, formerly occupied by the Jesuit College, during the construction of the new Parliament Building.

The Cathedral of St. Vitus, which had been in the process of construction for nearly 600 years, was completed in October, 1929. In 1928 the Royal Crypt, in which are buried such famous rulers as Emperor Charles IV, King George of Poděbrady, and Emperor Rudolph II, was opened. Round the crypt are remnants of the Roman building of the church dating from the twelfth century. In front of the former presbytery of the Cathedral, a monolith was erected in 1928 to commemorate the valor of Czechoslovakia's Unknown Soldier. A bronze statue of Woodrow Wilson also was erected the same year, in front of the Wilson Station, by

Czechs living in the United States, as a mark of gratitude for the American President's sympathy in Czechoslovakia's fight for freedom. In 1925, 510 years after his death, a monument was erected to John Huss, and a Museum of the Czech Reformation, with special emphasis on the Hussite movement, was housed in the former Summer Palace. The Nunnery of the Blessed Agnes, founded in the thirteenth century, is to be entirely restored and used as a lapidarium or municipal museum, and in the Nostitz Garden there is to be erected the new State Art Gallery in which will be housed Prague's public collections of pictures, statues, and graphic art productions. The Museum of the Czechoslovak Legions was erected in 1928 at the foot of the Žižkov Hill, and it is the intention of the authorities to erect on the summit a statue of the celebrated Hussite commander, Jan Žižka, and a monument to commemorate the legionnaires who lost their lives during the World War.

PRAJADHIPOK, KING OF SIAM (1893-). He was born at Bangkok, the son of King Rama V (Paramindr Maha Chulalongkorn), and succeeded to the throne following the death of his brother, King Rama VI, on October 26, 1925. He was crowned Feb. 25, 1926, and immediately inaugurated a policy of economic and commercial development of the country along modern lines. Prajadhipok has strengthened the position of his country and of himself as an independent Oriental monarch by recently concluded treaties of friendship and commerce with the leading powers of Europe and with the United States. He married Rambai Barni. See SIAM

PRANDTL, LUDWIG (1875-). A German scientist in charge of experimental work on aerodynamics in the laboratory at Gottingen. He published, with C. Wieselsberger and Dr. A. Betz, *Ergebnisse der aerodynamischen Versuchsanstalt zu Gottingen*, containing heretofore unpublished results of experiments, some conducted during the World War, and some shortly after its termination. He is best known for the *Technische Berichte* included in his book.

PRATELLA, BALILLA (1880-). An Italian composer, born at Lugo. He was trained at the Liceo Rossini in Pesaro, taught at Cesena, and in 1910 became director of the Istituto di Musica at Lugo. He was one of the most active of the extreme futurists, both as composer and writer. He was the first to formulate the musical creed of the futurists, as early as 1915. His writings are mainly attacks on established standards and institutions. His compositions may serve as practical illustrations of his theories. He wrote the operas, *Lulu* (Lugo, 1913), *La Sana di Vargoun* (Bologna, 1919), *L'Aviatore di Dro* (Lugo, 1920), *La Nanna Nanna della Bambola* (Milan, 1923), and *Dono Primavera* (Bologna, 1923); *Romagna*, five poems for orchestra; *La Guerra*, three dances for orchestra; *Inno a Vita*; chamber music; and pieces for organ and for piano.

PRATT, JAMES BISSETT (1875-). An American professor of philosophy, born at Elmira, N. Y., and educated at Williams College and Harvard University. In 1905 he joined the faculty of Williams, where he has been professor of philosophy since 1913. He studied the native religions of India in 1913-14 and Buddhism in China, Japan, and Siam in 1923-24. With Santayana, Lovejoy, and others, he published *Essays on Critical Realism* (1920). His other writings are concerned largely with the philos-

ophy of the religious life. They include: *The Psychology of Religious Belief* (1907); *What Is Pragmatism?* (1909); *India and Its Faiths* (1915); *Democracy and Peace* (1916); *The Religious Consciousness* (1918); and *Matter and Spirit* (1922).

PRATT INSTITUTE. A nonsectarian institution for men and women in Brooklyn, N. Y., founded in 1887, comprising four schools: Fine and applied arts, household science and arts, science and technology, and library science. The enrollment for 1923-24 was 3722, for 1928-29 it was 4614. The faculty was increased during the same period from 157 members and approximately 65 lecturers to 175 members and 79 special lecturers; the library from 109,098 volumes in 1914 to 140,000 in 1928. President, Frederic B. Pratt, A. M., LL. D.

PRAY, JAMES STURGIS (1871-). An American landscape architect. During 1905-14 he was assistant professor of landscape architecture, and from 1914, Charles Eliot professor, at Harvard University, and from 1908 to 1928, chairman of the school of landscape architecture. From 1915 to 1920, he was Harvard adviser to the Cambridge Planning Board, meanwhile acting (1917) as city-planning expert in laying out various army cantonments, and planning (1918) United States government towns for munition workers. He was founder and in 1920-21 chairman of the National Conference on Construction in Landscape Architecture. He was special lecturer at the Massachusetts Institute of Technology, 1922-27, and author of *City Planning*, with Kimball (1913).

PRESBYTERIAN CHURCH. The Presbyterian Church comprises nine branches, as follows: Presbyterian Church in the United States of America; Presbyterian Church in the United States (South); Cumberland Presbyterian Church; United Presbyterian Church; Colored Cumberland Presbyterian Church; Associate Reformed Presbyterian Synod; Reformed Presbyterian Church Synod; Reformed Presbyterian Church, General Synod, and Associate Synod of North America. The Presbyterian and Reformed churches represent those features of the Reformation which were emphasized by Calvin and Zwingli.

As a whole, the various branches of the Presbyterian Church showed marked growth in the years between 1924 and 1929. The total number of members, in full communion and good standing, in the United States increased from 2,948,140 in 1922 to 3,292,610 in 1928. The members and adherents of the Presbyterian and Reformed churches throughout the world, all holding the Presbyterian system and organized in a World Alliance for purposes of fellowship and cooperation, increased during the period from 41,000,000 to 49,763,940, exclusive of more than 5,000,000 Reformed Lutherans.

In the United States, the largest of the Presbyterian churches is the Presbyterian Church in the United States of America. Its membership increased from 1,458,085 in 1914 to 2,004,467 communicants in 1929, and the number of Sunday-school scholars from 1,318,628 to 1,595,313. The number of churches dropped from 10,130 to 9361, and the number of ministers was increased from

9536 to 9966. Contributions in 1914 totaled \$27,681,970, and in 1929, \$65,113,110. Of the total for 1914, \$2,401,972 was contributed for home missions, \$1,562,800 for foreign missions, \$891,654 for education, and \$19,771,059 for general congregational expenses, and of the 1929 total, \$4,404,123 was contributed for home missions, \$3,806,946 for foreign missions, \$926,000 for education, and \$49,450,686 for congregational expenses.

The Presbyterian Church maintained 11 theological seminaries in 1914 and 13 in 1929. The reports of the Board of Foreign Missions showed a decrease between 1914 and 1928 from 27 to 26 foreign missions, and from 166 to 156 stations, but an increase from 1428 to 1527 missionaries, from 6856 to 8803 native helpers, from 1027 to 1385 fully organized churches, and from 178,299 to 196,781 communicants. The number of mission-school students increased from 78,733 to 105,635, and the number of Sunday-school scholars, from 232,321 to 305,088, and the number of hospitals and dispensaries, from 175 to 210.

The administration of the church is through the office of the General Assembly, the Rev. Lewis Seymour Mudge, D. D., LL. D., chief permanent executive officer, with departments of administration, publicity, vacancy and supply, church cooperation and union, and historical research and conservation; the General Council; and four boards as follows: National Missions and Foreign Missions, both at 156 Fifth Avenue, New York; Christian Education and Pensions, both at Witherspoon Building, Philadelphia.

The Presbyterian Church in the United States has always maintained a place of outstanding leadership in all movements toward the reunion of Christendom and has laid special emphasis upon the ultimate organic union of all of the Reformed churches in America holding the Presbyterian system of government. Looking to this end, union was achieved in 1906 with the Cumberland Presbyterian Church, and in 1920 with the Welsh Calvinistic Church. Negotiations were in progress during 1929 for union with the United Presbyterian Church and with the Reformed (Dutch) Church in America. In 1929 overtures by the Methodist Episcopal Church looking toward organic union were also under consideration.

The Presbyterian Church in the United States (South), often called the Southern Presbyterian Church, became a distinct denomination in 1861. It increased its membership of communicants in good standing from 310,612 in 1914 to 444,657 in 1928, its churches from 3430 to 3596, and the number of its ministers from 1819 to 2342. Its theological seminaries numbered four in 1915, and five in 1928.

See also CUMBERLAND PRESBYTERIAN CHURCH and UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA.

PRÉVOST, pré'vò' (EUGÈNE) MARCEL (1862-). A French novelist (see VOL. XIX) who was literary editor of the *Revue de France*. His later works include *Monsieur et Madame Moloch*; *L'adjudant Benoit*, translated into English as *Benoit Castain* (1916); *D'un poste de commandement*, a play produced in 1918; *La nuit finira* (2 vols., 1920); *Mon cher Tommy* (1920); *Le domino jaune* (1921); *Les Don Juanes* (1922); *L'art d'apprendre* (1922); *Nouvelles lettres à Françoise* (1924); and *Ma maîtresse et moi* (1925).

PRICES. Changes in price levels, in distinction from changes in the cost of living, are measured customarily from differences in wholesale prices of certain commodities. The commodities usually selected are those which have been available in the markets in uniform grade for some period of time and seem likely to continue to be so available in the future. In the United States, the more important index numbers for wholesale prices are those of the U. S.

Bureau of Labor Statistics, the Federal Reserve Board, *The Annalist*, Bradstreet, Dun, and the somewhat different type of index number established by Prof. Irving Fisher. Price changes in Great Britain are shown by the index numbers of the British Board of Trade, *The Economist*, and *The Statist* (Sauerbeck). For Canada, we have the index number of the Dominion Bureau of Statistics; for Australia, that of the Commonwealth Bureau of Census and Statistics; for France, that of the Statistique Générale; for Italy, that of Prof. Riccardo Bachi, for Japan, that of the Bank of Japan in Tokyo. Index numbers of wholesale prices are available also in many other countries. While there is always some variation in the amount of change shown by different index numbers in the same country, as well as by those for different countries, according to the kinds of commodities selected as the basis for the index number and the way in which the prices of these commodities happen to be affected by current market conditions, there was a surprising uniformity prior to the World War in the price trend shown by the indexes then available. Following a world-wide increase in prices over many years, a decrease in prices began about 1873 in all countries and continued until about 1896. An upward movement then began and was still in progress in 1914.

With the many and varied economic disturbances caused by the War, the accurate measurement of changes in price levels became increasingly difficult. Prices of certain articles rose rapidly, others but slightly. Elaborate systems of price fixing were established in many countries; fairly high prices were fixed in some in-

INDEX NUMBERS OF WHOLESALE PRICES, BY YEARS, 1890 TO 1928 UNITED STATES [1926 = 100]

Year	Farm products	Foods	Hides and leather products	Textile products	Fuel and lighting	Metals and metal products	Building materials	Chemicals and drugs	House- furnishing goods	Miscel- laneous	All com- modities

stances to encourage production, and in other instances fairly low prices were fixed to check profiteering, both in connection with large sales to the Government and its allies, and in connection with retail sales to consumers. The general effect of price control in the United States is illustrated by the accompanying table showing index numbers for a large number of commodities brought under official control between August, 1917, and November, 1918, in comparison with other commodities left uncontrolled.

In the European countries especially closely affected by the War, price control began much earlier than in the United States; a large number of articles were usually covered, and all price rulings were carefully enforced. In all countries, however, whether or not there was price control, uniform tendencies were found in price trend, indicating the strength of the forces which control changes in price levels in all parts of the world. As between 1913 and 1914, almost no change in price level was shown. A significant and continued increase beginning in 1915 culminated about October, 1918. During the winter of 1918-19, there were slight and irregular fluctuations in prices, followed by a period of rapid increase, until the peak was finally reached during the summer of 1920. Prices then fell even more rapidly during a year and up to 1924 remained relatively stationary with slight tendencies toward small increases in most countries, the exception being in the price indexes of countries with a depreciating paper currency. Following 1924, prices in the United States fluctuated within a narrow range. The accompanying table, prepared by the U. S. Bureau of Labor Statistics, gives index figures for wholesale prices, based on 1926. Some 550 commodities were used.

Although, as has been indicated above, a policy of price fixing was adopted during the War as a stimulus to production, there was little tendency to continue this policy longer than necessary for war purposes. This has been true also with reference to price fixing as a means of protecting purchasers from excessively high prices in relation to costs of production and distribution; every effort was usually made to restore as rapidly as possible earlier conditions of price control through free and open competition. The acute housing shortage in many countries necessitated the protection of tenants from rent increases until additional housing construction should have brought available supply of houses into closer relation to acute demand for housing accommodations. See AGRICULTURAL CREDIT; FINANCE AND BANKING; HOUSING.

PRIESTLEY, JOHN BOYNTON (1894-). A British writer, whose chief fields were those of biography, essay, and critical review. He was born at Bradford, educated there and at Trinity Hall, Cambridge, and served in the army throughout the World War. Besides articles for magazines, his publications include *Brief Diversions* (1922); *I For One* (1923); *Figures in Modern Literature* (1924); *The English Commo Characters* (1925); *Talking* (1926); *George Meredith* (1926) and *Thomas Love Peacock* (1927) in the English Men of Letters Series; *Adam in Moonshine* (1927); *Benighted* (1927); *Too Many People* (1928); *Apes and Angels* (1928); *English Humor* (1928); *Farthing Hall*, with Hugh Walpole (1929); and *The Good Companions*, novel (2 vols., 1929). Some of the

works that he edited were *Tom Moore's Diary* (1924); *Essayists Past and Present* (1925); *Fools and Philosophers: a Gallery of Comma Figures in English Literature* (1925); and *The Bodley Head Book of Verse* (1926).

PRIESTLY, HERBERT INGRAM (1875-). An American historian, born at Fairfield, Mich., and educated at the University of Southern California. He taught in California for several years and from 1901 to 1904 was a teacher and superintendent of schools in Luzon, P. I. Returning to the United States, he was superintendent of schools and teacher in California high schools until 1912, when he was appointed assistant curator of the Bancroft Library at the University of California. In 1920 he became librarian and also associate professor of Mexican history at that university and in 1923 full professor of the same subject. He wrote *José de Gálvez, Visitor-General of New Spain, 1765-71* (1916); *The Mexican Nation, a History* (1923); *The Luna Papers* (1927); *The Neighbors of the English* (1928); *The Coming of the White Man, 1492-1849* (1929), and many articles on Californian, Mexican, and Spanish-American history. In 1918 he was awarded the second Loubat Prize at Columbia University for the best work on the history of North America during the colonial period.

PRIMITIVE MAN. See ANTHROPOLOGY.

PRIMO DE RIVERA. See RIVERA Y ORBANEJA, MIGUEL PRIMO DE.

PRINCE, JOHN DYNELEY (1868-). An American diplomat (see VOL. XIX). He resigned as professor of Slavonic languages at Columbia in 1921 when he was appointed Minister to Denmark. Since 1926 he has been Minister to Yugoslavia. He wrote *Practical Grammar of the Lettish Language* (1925).

PRINCE, MORTON (1854-1929). An American neurologist and psychologist born in Boston (see VOL. XIX). Dr. Prince was active in relief and other war activities following the entrance of the United States into the World War and received numerous foreign decorations. He was made associate professor of abnormal psychology at Harvard University in 1926. In addition to his earlier works, he published numerous monographs on medical, psychological, and philosophical subjects and collaborated in a number of medical volumes. See PSYCHOLOGY AND PSYCHOANALYSIS.

PRINCE EDWARD ISLAND. The smallest of the Canadian provinces with an area of 2184 square miles. In 1911 the population was 93,728; in 1921 it had fallen to 88,615, or a decrease of 5.5 per cent. In 1929 the population was estimated officially at 86,100. The rural population was still preponderant though it declined as a result of the migrations to the cities; 84 per cent of the population was rural in 1911, and 78.5 per cent in 1921. Populations of the principal cities in 1921 were: Charlottetown, 12,347; Summerside, 3228.

Industry and Trade. Of the total 1,397,990 acres in the province, 1,216,483 acres are occupied as farms. Among the field crops, hay and clover, oats, potatoes, and wheat receive the most attention. Diversified farming, however, is the rule, the abundance of fodder crops making the live-stock industry particularly important. Total value for farm products was \$22,012,000 in 1927. Fox breeding continues to be important and yielded over \$3,000,000 in 1926, there being in this year 575 fur farms with land and build-

ings valued in excess of \$1,000,000. The fish catch netted \$1,367,807 for 1927, as compared with \$1,379,905 in 1913. Lobsters make up three-fourths of the total and are canned in local establishments. Manufacturing continues on a small scale. In 1927 the 291 establishments represented a capital of \$3,081,504 (\$2,013,365 in 1910), employed 2332 workers, and had a gross output valued at \$4,493,628. Exports to foreign countries in 1928 amounted to \$1,265,888; imports for consumption, to \$1,734,583. In 1927 there were 279 miles of railways.

Government. Revenues for 1927 were \$836,748; in 1914 they were \$525,555. Expenditures for 1914 and 1922 were \$445,396 and \$870,427. The bonded indebtedness of the province in 1927 was \$1,933,000. Expenditures on education for 1913 were \$261,641; for 1927, \$458,477, of which \$284,313 was government grants and \$174,164 local assessment. Women have been enfranchised and given the right to stand for the provincial assembly. Representation in Canadian Parliament House of Commons, 4; Senate, 4.

PRINCE OF WALES. See EDWARD ALBERT CHRISTIAN GEORGE ANDREW PATRICK DAVID, PRINCE OF WALES.

PRINCETON UNIVERSITY. A nonsectarian institution for men at Princeton, N. J., founded in 1746. The enrollment increased from 1641 in 1914 to 2453 in 1928, of whom 2226 were undergraduates. In 1922 a limitation of numbers to about 2000 undergraduates was adopted owing to lack of housing and teaching equipment for a larger registration. During the period, the productive funds of the university increased from \$5,399,150 to \$17,743,840; the faculty from 207 to 264 members, and the library from 320,701 to 611,000 volumes. With the limitation of enrollment, a selective process was instituted by which admission was based not only on scholarship, but also on character. As a continuation of the Reserve Officers Training Corps maintained during the war period, the Reserve Officers Training Corps in Field Artillery was instituted after the War, commissioning selected students, on graduation, to serve as reserve officers in the United States Army. The necessary reconstruction of the university on a more substantial financial basis led at the close of the War to a campaign for increasing endowment and nearly \$10,000,000 was collected. The executive and administrative departments of the university also were reorganized with a view to better coordination. Faculty autonomy and sympathetic cooperation between the board of trustees and the faculty were developed. All questions of academic policy were discussed in joint council through a conference committee; a plan for systematizing faculty appointments, salaries, promotions, retirement, and pension was in operation; the faculty had a voice in nominating its committees; representatives of the faculty sat with the trustees' committee on honorary degrees; and the rights of the individual in case of dismissal were safeguarded.

In 1925 the first Princeton Summer Art Institute was held under the auspices of the Harvard-Princeton Fine Arts Club. In 1926, by the will of David Paton, the Egyptologist, his library of 2900 volumes was left to the university and the Garret Collection of Arabic Manuscripts acquired 500 items by purchase from the Baroody and Widgery collections. The psychological laboratory, Eno Hall, the buildings of the artillery department, and several dormitories were

completed. In 1927, \$150,000 was given anonymously to endow a chair in geography; the library received an endowment from Mrs. P. L. LeBrun for the development of the valuable Montaigne and Rabelais collections, and the private library of the late Charles Richard Williams, poet and scholar; \$150,000 was used by Arthur Sachs of New York to establish the Arthur Sachs Foundation to finance *Art Studies*, a publication issued jointly by the department of art and archaeology at Princeton and the division of fine arts at Harvard. The Princeton Scientific Expedition in 1928 discovered in the Bighorn Basin of Wyoming valuable fossil material for the study of the mammalian fauna of the lower Eocene.

Chiefly as a result of an endowment increase of \$2,000,000 raised by the alumni, the scale of faculty salaries was raised in 1928. The new range is \$6000 to \$9000 for full professors, \$4500 to \$5750 for associate professors, and \$3000 to \$4250 for assistant professors. Extensive building operations were engaged in, including the Lockhart Dormitory, extensions to the Graduate College, the gymnasium, and McCormack Hall for the school of architecture, and an engineering school dedicated in the fall of that year. Mr. Harvey S. Firestone gave \$50,000 to the university chapel fund. Early in 1929, \$500,000 was given by Thomas D. Jones and Miss Gwethalyn Jones of Chicago for a building to be devoted to the department of mathematics and the department of mathematical physics and in memory of the late Dean Henry Burchard Fine. President, John Grier Hibben, Ph.D., D.D.

PRINGLE-PATTISON, ANDREW SETH (1856-). A British philosopher (see VOL. XIX). He retired as professor of logic and metaphysics in the University of Edinburgh in 1919 and was Gifford lecturer at the university in 1921-23. He was made a fellow of the British Academy. His later publications include *The Idea of God in the Light of Recent Philosophy*, Gifford lectures (1917), *The Idea of Immortality*, Gifford lectures (1922); *The Philosophy of History*, British Academy lecture (1923). He edited *Locke's Essay Concerning Human Understanding*, abridged (1924), and *Essays in Ethics and Religion*, by Professor James Seth, published with a memoir (1926).

PRITZWITZ UND GAFFRON, FRIEDRICH WILHELM VON (1884-). A German diplomat, who was born in Stuttgart. Entering the diplomatic service in 1909, he served in a subordinate capacity at the embassies in Washington and St. Petersburg (Leningrad) previous to the World War. During that conflict, he was in the German Chancellor's office. Appointed consul in Trieste in 1920, he was transferred to the German Embassy at Rome in 1921 and served there until his appointment as Ambassador to Washington in January, 1928.

PROBATION. See JUVENILE COURTS.

PRODUCERS' COÖPERATION. See CO-OPERATION.

PROHIBITION. Prohibition is the term generally used throughout the United States to describe governmental prohibition of the manufacture, sale, and transportation of intoxicating alcoholic beverages. As an outgrowth of the temperance and anti-saloon movements of many preceding decades, it became one of the outstanding issues of the period after 1914. Many believe that prohibition by legislation and amendment was precipitated by the World War. Fed-

eral or national prohibition is the culmination of various efforts to regulate and restrict the liquor traffic and is a sequence to cumulative local and State prohibition. The term prohibition is being used to include activities similar to those just mentioned when they occur in other countries.

Local and State Prohibition. Prohibition early became effective in the United States through the exercise by communities of the privilege of "local option" in this matter, as extended to them through State legislation. In time, this local option extended to districts and to States; and until 1914 it was the prevailing form of prohibition in the United States. State-wide prohibition, by legislation and constitutional amendment, spread rapidly during the first few years of the decade 1914-24. At the close of 1913, only nine States had "gone dry," as the popular expression went. Eight of these, Maine, North Dakota, Kansas, Oklahoma, North Carolina, Georgia, and Mississippi, had adopted State-wide prohibition before 1910; West Virginia joined these in 1912. In some of these States, the early enforcement legislation proved inadequate, and the States did not have what was commonly called "bone-dry" legislation until a later date. In 1914 four more States, Colorado, Oregon, Virginia, and Washington, brought the total to 13; and in 1915, three more, Alabama, Arizona, and South Carolina, made the total 16. Alabama had enacted statutory prohibition in 1909 which was practically repealed in 1911 and reenacted in 1915. In 1916 seven additional States, Arkansas, Idaho, Iowa, Michigan, Montana, Nebraska, and South Dakota, made a total of 23, one less than half the number of States in the United States, but principally the less densely populated Southern and Western States. In others, there had been a rapid extension of local prohibition under local option, so that some of these States were half, and a few three-quarters, dry territorially.

All of this occurred before the United States entered the World War in 1917. State-wide prohibition continued to spread steadily, and before the Federal Amendment had become effective in 1920, State-wide prohibition had carried in 10 more States. Four of these, Indiana, New Hampshire, New Mexico, and Utah, went dry in 1917; four, Florida, Nevada, Ohio, and Wyoming, in 1918; and two, Kentucky and Texas, in 1919. The amendments and legislation in many of these States did not become effective until the year following its adoption, and in several cases not until the second year thereafter. Prior to the time that the National Prohibition Amendment became effective, 33 States had adopted some form of State-wide prohibition, and many of the States had supplemented their early legislation with "bone-dry" laws. It has been estimated that the dry territory at this time contained about two-thirds of the population of the United States, for some of the more densely populated States, so far as State legislation was concerned, remained "wet" until they came under Federal prohibition. Considerable sections of these 15 wet States were, however, under local prohibition. In 21 of the 33 dry States, the issue had been decided by popular vote and in 12, by the respective State legislatures.

Federal Prohibition Legislation. Federal action on this issue began in 1913, when the Prohibitionists attained a majority in Congress, which up to 1924 they had never lost. The first act was the passage of the Webb-Kenyon Inter-

State Liquor Shipment Act over the veto of the President of the United States. This act made illegal the shipment of liquor from a "wet" to a "dry" State. Although President Taft vetoed the bill because in his opinion it was unconstitutional, the Supreme Court handed down a decision (Jan. 8, 1917) upholding its constitutionality. Shortly after this decision, the Alaska Prohibition Act and the Porto Rico Prohibition Referendum were passed. On Mar. 3, 1917, the President signed the District of Columbia Prohibition Bill, which became effective Nov. 1, 1917. As a result of activities led by Senators Reed and Jones and by Representative Randall, there were passed as amendments to the Post Office Appropriation Bill provisions whereby the United States mails were closed to all advertisements of the sale of alcoholic beverages, including letters or newspapers containing the same, when addressed to any person, firm, corporation, or association in any State or Territory where the sale and manufacture of intoxicating liquors had been prohibited. These amendments included what was in effect an extended and more definite statement of the intent of the Webb-Kenyon Act. This legislation was also approved by the President on Mar. 3, 1917.

During the War, a number of emergency measures, restrictive and prohibitive, were passed, aiming to conserve the food and fuel supply and to protect the efficiency of the Army and Navy and of the workers in the war industries. Among these was the War Prohibition Act, passed Nov. 21, 1918, and effective in July, 1919, which forbade until demobilization had been completed the sale for beverage purposes of distilled, malt, or vinous intoxicating liquors. This act continued to function until the Eighteenth Amendment became effective.

The Eighteenth Amendment. The general movement for Federal prohibition registered itself in 1914, when a resolution proposing a constitutional amendment received a majority vote in the House of Representatives, and in 1916, when such a motion was reported by committee in the Senate. A resolution submitting to the States the National Prohibition Amendment to the Constitution of the United States was adopted by the Senate on Aug. 1, 1917, by a vote of 65 to 20, and passed with slight amendments by the House of Representatives on Dec. 17, 1917, by a vote of 282 to 128. The day following, the Senate concurred, and the resolution was adopted. The article of the joint resolution which is now Article XVIII of the Amendments to the Constitution was and is as follows:

1. After one year from the ratification of this article, the manufacture, sale or transportation thereof of intoxicating liquors within, the importation into, or the exportation thereof from, the United States and all territory subject to the jurisdiction thereof, for beverage purposes, is hereby prohibited.

2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several States, as provided by the Constitution within seven years from the date of the submission hereof to the States by the Congress.

The legislatures of the necessary three-fourths (36) of the States had ratified the amendment on Jan. 16, 1919. The ratification was proclaimed by the Secretary of State on January 29. Subsequently, 10 additional States ratified. The States that did not ratify were Rhode Island and Connecticut.

Federal Enforcement Legislation. The National Prohibition Act, commonly known as the Volstead Act, was passed by Congress and submitted to the President, who vetoed it on Oct. 27, 1919. The same day, the House voted to pass over the veto: yeas, 176; nays, 55; answering present, 3; not voting, 197. The next day, the Senate voted to pass over the executive veto: yeas, 65; nays, 20; not voting, 11. This act fixed one-half of 1 per cent as the maximum of alcohol in nonintoxicating beverages. It placed responsibility for enforcement with the "Commissioner of Internal Revenue and his assistants." They were to "investigate violations" and to "report to the local United States Attorney," who must "prosecute offenders under the Attorney General's direction." The law provided for drastic enforcement of the amendment and established strict regulation of the distribution of liquor for the few specific uses permitted by the law. The United States Supreme Court on June 7, 1920, in a unanimous decision sustained the validity of the Eighteenth Amendment and of the Volstead Act. In 1925 steps toward the centralization of the enforcement machinery were taken by Secretary of the Treasury Mellon, when he combined the administration of the activities of the Customs Service, the Coast Guard, and the Prohibition Unit under one head, an Assistant Secretary of the Treasury.

General Lincoln C. Andrews, the first incumbent of this post, served from 1925 to August, 1927, when he was succeeded by Seymour Lowman of New York. Under the new plan, the 49 State Federal Prohibition directors were eliminated and for them there were substituted 24 Federal Prohibition Administrators in charge of areas corresponding to the Federal judicial districts. In 1927 Congress enacted a series of laws placing enforcement agents under the Civil Service, making the Prohibition Unit a Federal bureau, and centralizing the whole enforcement machinery in the office of the Secretary of the Treasury.

To strengthen further the enforcement process, Congress in 1929 enacted the drastic Jones Law which provided that persons convicted of manufacturing, importing, exporting, selling, and transporting liquor could be sent to jail for five years and fined \$10,000. Under Assistant Attorney General Mabel W. Willebrandt (resigned in 1929), in the Coolidge and Hoover administrations, the Department of Justice prosecuted prohibition violators vigorously, though in New York City serious setbacks were received in the refusal of juries to find indicted persons guilty because of the vigorous penalties awaiting them. During the period, in a number of decisions, the Supreme Court interpreted the prohibition law strictly, even countenancing in 1928 by a vote of 5 to 4, the use of wire-tapping by enforcement agents endeavoring to obtain evidence against suspects.

For the fiscal year 1924-25, \$10,629,770 was spent by the Federal Government on prohibition. For the year 1928-29, Congress authorized the expenditure of \$13,500,000 for the Prohibition Bureau and \$14,686,000 for the Coast Guard. The debate in Congress at that time indicated that such a sum was preposterously small. The wets sought to pass a bill voting an expenditure of \$300,000,000 for enforcement on the theory that prohibition should be given a complete test once and for all; but the dries evidently feared

to put the matter to the test, for they fought the passage of higher appropriation measures.

One of the serious charges made against the enforcement machinery during the period was the high toll of life taken. Figures published in 1929 showed that, during 1920-28, 135 civilians and 55 dry agents had been killed through dry enforcement work. The divided authority between the enforcement and prosecuting agencies, and the obvious weaknesses in the enforcement machinery led President-elect Hoover in 1928 to announce that one of the early tasks of his administration would be a complete overhauling of the enforcement machinery.

Treaties. On Jan. 23, 1924, the United States and Great Britain signed a liquor treaty by which Great Britain agreed to waive her rights beyond the three-mile limit to permit American revenue ships to pursue suspect ships for the purpose of boarding. The right of seizure was recognized within one hour's sailing distance from the coast. Treaties along similar lines were made with the following powers during 1924-28: Norway, Germany, Sweden, Denmark, Italy, Panama, Netherlands, France, Greece, and Japan. In 1924 the Canadian government signed a treaty by which it agreed to cooperate with the United States in checking rum-running. Mexico in 1925 and Cuba in 1926 followed suit. In 1929, however, Canada refused to give the American government additional rights in its attempt to cope with liquor smuggling across the border on the score that it could profit nothing from such an arrangement.

In March, 1929, the whole subject of the status of these treaties became a matter of discussion when a Coast Guard cutter fired upon and sank the *I'm Alone*, an admitted Canadian rum-runner, 215 miles off the Louisiana coast. The American prohibition agents insisted they were entitled to the right of continuous pursuit if the chase had been taken up within the allowed one-hour's sailing distance (12 miles). In April, Canada filed a formal protest.

Anti-saloon League of America. The agency more responsible than any other for leadership in the State and National prohibition legislation during the decade was the Anti-saloon League of America. Organized in May, 1893, it is frequently described as "the church in action against the saloon." It is properly credited, both by its friends and its enemies, as having been chiefly responsible for the rapidly increasing sentiment in favor of prohibition. It is organized by States and acts as an agent for the churches in matters concerning the annihilation of the liquor traffic. The league established national propaganda headquarters at Washington, D. C., in 1915, and in 1916 it launched the national campaign for the amendment of the Federal Constitution. It has kept a corps of trained men at the National and at State capitals to represent its constituency. It has examined the practices of representatives of the people and inquired into the attitude of candidates for public office, in so far as these related to prohibition, and opposed those who did not concur, regardless of party affiliation. Since the adoption of the Eighteenth Amendment and the passage of the Volstead Act, it has turned its energies to the difficult task of promoting law enforcement, to project a programme of Americanization, and to carry on the work of prohibition in foreign countries. For the latter purpose, the World League against Alcoholism has

been formed. The avowed purpose of the new organization is "to attain by means of education and legislation the total suppression throughout the world of alcoholism." It pledges itself to "avoid affiliations with any political party as such, and to maintain an attitude of strict neutrality on all questions of public policy not directly and immediately concerned with the traffic in alcoholic beverages." The leading spirit and general counsel of the Anti-saloon League, Wayne B. Wheeler, died in September, 1927. His work was thereafter divided in two sections headed, respectively, by Dr. F. Scott McBride, in charge of the political and legislative work, and Ernest H. Cherrington, in charge of the education and propaganda.

Opposition. Beginning about 1925, opposition to the Prohibition Amendment began to take on a serious and organized form. Up to that time, opponents had talked vaguely of sumptuary legislation, States' rights theories, unwarranted extension of police power, etc. From 1925 on, however, the principle of nullification (its use had been effectively pointed out by Walter Lippmann) began to be applied. The Association Against the Prohibition Amendment, which was organized in 1927 and elected Henry H. Cuiran as its president in 1928, with a large budget and effective educational methods, gave serious attention to organizing this sentiment. The result was that during 1926-29, the following action took place. In April, 1929, the Legislature of Wisconsin repealed the State enforcement law, in 1929 the New York Legislature refused to pass a State Enforcement Act (which it had originally repealed in 1923), the Illinois electorate in 1926 voted in favor of the modification of the Volstead Act, the Montana Legislature in 1928 refused to enact the Volstead Law as a State law to replace its repealed Prohibition Law (1926); the Nevada electorate in 1926 voted "yes" on these two questions. "Is Prohibition a failure?" and "Should Congress call a Constitutional Convention to amend the Eighteenth Amendment?"

Similarly, in 1928, the Massachusetts voters instructed their State Senators to ask Congress to repeal the Eighteenth Amendment. The proposals to repeal State enforcement acts won in Illinois by a vote of 3 to 2; in New York by a vote of 3 to 1; and in Nevada by a vote of 4 to 1. On the other hand, similar proposals were voted down in North Dakota, Colorado, California, and Missouri, but by very small majorities.

Governor Alfred E. Smith of New York, in the presidential campaign of 1928, evoked much popular enthusiasm in his demand for the modification of the prohibition law on the basis of State manufacture and sale of alcoholic beverages. While the drys claimed his defeat as a victory for prohibition, it was generally recognized that the election did not centre on the prohibition issue and that Governor Smith's defeat was due in part to other causes.

Social and Economic Consequences of Prohibition. Many statistics have been compiled in order to prove the good and ill effects of prohibition. Proponents have seen in the passing of the saloon an undoubted social gain; from this have come prosperity, decline in dependency, increase in savings-bank accounts, etc. Opponents attribute to prohibition the increase in drinking among the youth of the country, the development of night-club life and the increase

in prostitution, and the great flaring up of crime: For example, the Association Against the Prohibition Amendment has found, since 1920, a gradual increase in the four major indices of intemperate drinking, etc., arrests for drunkenness, arrests of drunken drivers, alcoholic insanity, and deaths from alcoholism. Of the many dubious statistical data cited on both sides, the American public made its choice, selecting those that confirmed previously arrived-at attitudes. There is no question that dependency was on the decrease rather than otherwise, and that prosperity was due to economic causes and not prohibition. The old-type saloon was worth abolishing; but whether the regulated sale of liquor (as was being done in Quebec) could not have effected the same end without producing the bootlegger, the rum-runner, and tainted or poisonous alcohol were subjects ardent drys refused to discuss.

The enthusiasm which greeted Governor Smith's proposals in 1928 showed that many thinking people had serious doubts whether prohibition on its present lines could ever be enforced or was indeed desirable.

By 1929, therefore, it was evident that prohibition had assumed the same proportions before the American public that the slavery question occupied before the Civil War. Slavery was a moral question and not solely economic or racial or social. So it was with prohibition. Evidence, no matter how scientific, could not persuade people to relinquish their present views or change them. The fact is, in only one way could its success be demonstrated and that was by honest and thoroughgoing enforcement. The drys were not willing to chance this yet, with the result that the South and West remained dry and the industrial centres were even wetter than before the prohibition era.

The Consumption of Liquor since Prohibition. The consumption of liquors has been of two sorts, legal and illegal. The former covers especially consumption for medicinal and sacramental purposes and conversion for industrial alcohol. The latter included irregular withdrawals from warehouses, domestic manufacture, and smuggling. The facts regarding the withdrawal of bonded liquors from bonded warehouses are comparatively definite. The "peak" of the annual withdrawals of liquor of this sort occurred in 1917, during which year 160,000,000 gallons were taken out of bond. In 1923 about 11,000,000 gallons were thus withdrawn. At the beginning of the decade, there were 285,000,000 gallons in bond and in 1923 but 45,000,000. It is self-evident that this source of supply could not long continue, and the activities of the enforcement unit were operating to make more difficult the removal of the balance for illicit purposes. The commercial manufacture of high alcoholic drinks seemed to have been abandoned by almost all of those engaged in this business prior to 1920. The consumption of beer is quite another matter. Prior to prohibition, beer constituted by volume 90 per cent of the liquor consumed in the United States. The American Brewers' Association estimated that the total production of beer after prohibition was about 20 per cent of what it formerly was, and there are reasons for believing that this is a fairly liberal estimate.

"Home-brew" activities spread rapidly. All efforts to gauge their extent in the aggregate were relatively futile. The various studies made

of the consumption of commodities essential to home brew, such as malt, rye, hops, yeast, etc., and of the sale of apparatus for the purpose, were full of errors and of doubtful hypotheses. There was much illicit manufacture of wines. This was somewhat reflected in the enormous traffic in grapes, which, however, must be considered also in relation to the general increase in the traffic in fruits and the increased use of grapes for unfermented grape-juice products. There were many ramifications of these activities, some of which were merely more extensive activity in ancient practices such as the making of hard cider and of applejack. Many prominent social workers were inclined to look on these activities, especially home brewing, as temporary reactions; novelties which were troublesome, expensive, a general nuisance, and which at best yielded unsatisfactory products of amateurs. They did, however, furnish a very considerable supply of alcoholic beverages for local consumption.

Liquor sold in "speakeasies" and by bootleggers came from other sources. During the period 1920-29, the chief sources for the illicit supply were the following:

1. *Rum Row.* Before the signing of treaties with foreign powers and the use of the Coast Guard in enforcement work, the illicit liquor came from foreign countries, i.e., Great Britain, Canada, West Indies, etc. This was run into ports by fast motor boats and despite heavy losses, the great size of the traffic made the business highly profitable. Beginning with 1924, however, the Government began to wage unceasing war on these rum rows, as the ships stationed outside the three-mile limit were called. By making treaties with foreign powers extending the right of search and seizure and by diverting the Coast Guard to this work, the Government by 1928 was able to say that rum rows had been eliminated.

2. *Synthetic liquor.* About 1924, liquor made from diverted industrial alcohol assumed the place of chief importance. Though the Government denatured all alcohol released for industrial purposes, using poisons to make them im potable, bootleggers were able to extract most of the poisonous or offensive substances by re-naturing processes. The less scrupulous were not so careful, with the result that many people were blinded or killed by consuming the poisonous stuff sold as a beverage. The people who suffered largely were the poorer classes who bought their "hooch" in "speakeasies." It was estimated in 1926 that fully 60,000,000 gallons of industrial alcohol were being diverted annually for the purpose of making synthetic liquor. About 1927, the Prohibition Bureau began to order the reduction of industrial-alcohol production; but by 1928 synthetic liquor was no longer the chief source of supply. It had been replaced by "wild oat" alcohol. Interestingly enough, when in 1928 the Durant Prize of \$5000 was given to an enforcement plan that was based on the checking of the diversion of industrial alcohol, even the Prohibition Bureau confessed that "wild cat" alcohol (the old moonshine) had taken first place. In other words, there were thousands of illicit stills working on a large scale making alcohol out of sugars, cereals, etc. It would appear that there were no limits to the resources of the bootlegger and that when he found one door closed to him he merely kicked open another.

Liquor Regulation in Other Countries.

In Canada, some of the provinces had prohibition; some, regulation. Prohibition was in effect in 1928 in Prince Edward Island (1907) and Nova Scotia (1916), but in 1929 by popular vote was abandoned for State control. British Columbia adopted prohibition in 1916 and changed to state control in 1921; Manitoba adopted prohibition in 1916 and state control in 1923; Ontario went dry in 1916 and adopted state control in 1929; Quebec has government control as has also New Brunswick. In England during the World War, the liquor traffic had been variously regulated, in zones about army and navy stations, and where war material was being handled; in 1921 a bill imposing somewhat similar restriction was enacted for the country as a whole, to regulate hours of sale and alcoholic content of hard liquor.

The proposal to adopt national prohibition was defeated (Apr. 20, 1923) in the House of Commons by a vote of 236 to 14. Finland, after having its prohibition legislation twice annulled by the Czar under the old régime, in 1917 again passed a prohibition law, effective in 1919. In Norway, as a result of a referendum in 1919, traffic in liquors containing over 14 per cent of absolute alcohol was forbidden, but following the threat of France, Spain, and Portugal to bar the fish products of Norway if her wine importation were cut off, the alcoholic content in 1923 was raised to 21 per cent. In 1926 the people of Norway went wet altogether by a vote of 525,423 to 415,637. Local option obtained in parts of Holland, Belgium, Scotland, Poland, and Denmark (where a uniform local-option bill failed in the Upper House in 1919); and some measure of regulation was being exercised in Germany, Austria, Northern Ireland, Japan, Mexico, and many South American countries. Federal control and taxation of liquor was defeated in Switzerland in 1923.

National and International Temperance Organizations. The following bodies were permanently organized for the promotion of temperance and the prevention of alcoholism: World League against Alcoholism; World's Woman's Temperance Union; Permanent International Congress on Alcoholism; International Order of Good Templars; Sons of Temperance; World Student Federation against Alcoholism; Intercollegiate Prohibition Association; World Prohibition Federation; National Temperance Council; National Legislative Conference; Scientific Temperance Federation; National Temperance Society; International Reform Bureau; Woman's Prohibition League of America; Committee of One Thousand. In addition, there are the various boards of churches and church federations. See WOMAN'S CHRISTIAN TEMPERANCE UNION; LAW, PROGRESS OF THE; AND UNITED STATES.

PROJECTILE. During the World War, several new types of shell were given trials; some seemed likely to come into general use. TNT (trinitrotoluene) became the explosive generally used in the bursting charge in place of picric acid compounds and gunpowder. (See EXPLOSIVES.) In the Naval services, the use of the common shell with thin walls and extra heavy bursting charge, in fleet action, was practically given up. The nonricochet or "diving" shell, so designed that, even at a low angle of impact, it would enter the water and nearly maintain its aerial direction, was devised for use against

submarines, and the models brought out near the close of the War were efficient. The gas shell, so effective in land operations, was little used at sea, although gas shell and aerial gas bombs are likely to be important features of naval warfare in the future unless barred by international agreement. Illuminating shells were used to some extent and were generally adopted as a necessary naval equipment. They may be fitted to burst in the air or on contact with the water and illuminate nearby objects. Smoke shell, producing a large volume of dense smoke, have a limited usefulness. Anti-aircraft shell, fitted with night and day tracers giving out visible lines of fire or smoke, continued to be improved in the years succeeding the War. See GUNS, NAVAL; ARTILLERY; ORDNANCE.

PROKOFIEV, SERGEI (1891-). A Russian composer, born at Sontsavka in southern Russia. Having received his first instruction from his mother, he entered the Petrograd Conservatory in 1904 and studied piano with Essipov and composition with Liadov and Rimsky-Korsakov. Graduating in 1910, he won the Rubinstein Prize. He made several tours as a pianist, appearing in the United States in 1918. As a composer, he belongs to the extreme futurists. His works include the operas, *Maddalena*, *The Gambler* (Petrograd, 1916), and *Love for Three Oranges* (Chicago, 1921); a ballet, *Le Bouffon*; *Sinfonietta*; a symphonic poem, *Dreams*, *Scythian Suite*, for orchestra, a *Classical Symphony*; *Overture*, on Jewish themes; a violin concerto; piano concertos, *Conjurations*, for soli, chorus, and orchestra; and miniature bits for piano and songs.

PROTESTANT EPISCOPAL CHURCH.

In doctrine, this religious body is similar to the Church of England, from which it is descended. It recognizes three orders in the ministry—bishops, priests, and deacons. The diocesan bishops are elected by the clerical and lay members of the convention of the diocese. Following the General Convention of 1925, the offices of the presiding bishop and the president of the National Council were merged into one and the office made elective instead of being filled on the basis of seniority in the House of Bishops. The term of office is six years. The number of communicants grew from 1,015,248 in 1914 to 1,241,828 in 1928. The number of clergy rose from 5538 in 1915 to 6237 in 1928, the number of Sunday-school pupils from 462,221 to 487,505, and the number of teachers and officers from 52,534 to 58,477.

The chief executive council of the denomination meets triennially, conventions being held at New Orleans, La., in 1925, and at Washington, D. C., in 1928. One of the most important problems scheduled to come before the 1928 convention was the revision of the Book of Common Prayer, begun in 1913. Completed in 1929, the revised Prayer Book was put in use in most churches the first Sunday in Advent. Other subjects considered were marriage and divorce, rural work, labor and industry, world peace, and young people in the church. A maintenance budget of \$4,224,670 annually was adopted for the current three years, and plans were laid for raising \$3,000,000 for future work. The triennial thank offering of the Women's Auxiliary amounted in 1928 to \$1,101,450, as compared with \$912,841

in 1925. It was decided to continue the Commission on Faith and Order, which had attended the Conference at Lausanne, Switzerland, in 1927, and to create a new commission to confer with Methodists and Presbyterians on the subject of church unity. Arrangements were made for the 1931 convention to be held in September at Denver, Colo. The deficit of \$1,534,303 with which the National Council of the church began the 1926-28 triennium was completely liquidated at the end of that period. This was largely due to the adoption of a pay-as-you-go plan at the 1925 convention, and the administrative ability of the Rt. Rev. John Gardner Murray, presiding bishop from 1925 until his sudden death on Oct. 3, 1929, at Atlantic City, N. J. C. P. Anderson, Bishop of Chicago, was elected presiding bishop in November 1929.

The national and foreign work of the church is carried on under the various departments of the National Council. Members of the Council serve as directors of the Domestic and Foreign Missionary Society, which is managed by the Department of Missions and Church Extension. During 1928 the Department of Missions expended \$2,697,664, out of a total budget for the National Council of \$2,809,361. Of this amount, \$1,152,019 was for field work in the foreign missionary fields and \$1,182,025 for work in domestic missions. There were 2628 men and women missionaries in the field in 1928, as compared with 3067 in 1927, 3406 in 1925, and 3105 in 1922. American missionaries in foreign fields in 1928 numbered 147 men and 181 women, the native staff in foreign fields, 1119 men and 531 women; missionaries in the United States, 457 men and 90 women, native staff in the United States, 101 men and two women. The decrease in the missionary staff in recent years was attributed almost entirely to conditions in China, where severe restrictions have been imposed upon missionary schools by the Nationalist government. After a church commission had investigated the situation in China from October, 1927, to April, 1928, the National Council, on Oct. 9, 1928, announced that schools in China supported in whole or in part by that body would not register so long as governmental regulations served to nullify their Christian character and purpose. In the United States, the church continued its missionary work. In addition to establishments in 10 European centres, the church maintains missionary stations in the Orient, Liberia, Mexico, the Philippines, Alaska, Hawaii, Brazil, the Canal Zone, Cuba, Porto Rico, Haiti, the Virgin Islands, and Palestine. Besides diocesan publications, the church issues *The Spirit of Missions*, *The Church at Work*, *Findings in Religious Education*, and *Bulletin of the National Council*. There are six independently owned periodicals concerned with the work of the denomination and circulated among its members. Headquarters of the National Council are in the Church Missions House, 281 Fourth Avenue, New York City. See **RELIGIOUS CONTROVERSIES**.

PROUST, prōōst, MARCEL (1871-1922). One of the leading French writers of the twentieth century, born in Paris. Proust, like his fictional hero, Swann, was a man of the world and seemed to his friends to be nothing more than that, with perhaps an amateurish interest in letters. At the age of 45, he had published only two French translations of Ruskin, *The Bible of Amiens* and *Sesame and Lilies*, and an original volume, *Les Plaisirs et les Jours* (*Delights and*

Days). It was in the preface to the latter volume that Anatole France indicated that Proust "delights equally in describing the desolated splendor of the setting sun and the agitated vanities of a snobbish soul." A man of feeble constitution, Proust alternated his mundane parties with seclusion in an invalid's bed. It was thus that he prepared himself to be the fictional Saint-Simon of French society of the *fin de siècle*. In 1914 he began the publication of his fictional notebooks, an 11-volume novel, *A la Recherche du Temps Perdu* (*In Search of Days Gone By*), which was completed but not all corrected or published at his death. Public attention was attracted to his work in 1919 when the section of his novel called *A l'Ombre des Jeunes Filles en Fleurs* (*Within a Budding Grove*, trans 1928) won the Prix Goncourt. He was hailed immediately as an eccentric literary genius who wrote from imaginative reminiscence instead of from imaginative construction. He described his literary method in the *Côté de Guermantes*. The sections of the novel are called: *Du côté du chez Swann* (*Swann's Way*); *A l'ombre des jeunes filles en fleurs*; *Le côté de Guermantes* (*The Guermantes' Way*), *Sodomie et Gomorrhe*, *La prisonnière*, *Albertine disparue* and *Le temps retrouvé* (1927). In 1927 *Chroniques, essais*, was published. Consult Lalou's *Histoire de la Littérature Française Contemporaine*, pp. 639-645 (1923) and Léon Pierre-Quint's *Marcel Proust, his life and work* (trans. 1927).

PROVIDENCE. The capital of Rhode Island and the second city of New England. The population increased from 224,326 in 1910 to 237,595 in 1920, in 1928 it was estimated to be 286,300, according to the Bureau of the Census. An extensive plan for the improvement of the port was started in 1918. The city appropriated \$800,000, the State, \$1,500,000, and the Federal Government, \$1,000,000 to have the harbor deepened and a straight 30-ft channel dredged to deep water. The State built a large pier with a two-story steel shed 400 by 100 feet, and the city built a quay 3000 feet long in 30 feet of water at mean low tide, equipped with complete freight-handling apparatus and railroad connections.

A new water-supply project was inaugurated in 1915 and completed in 1928 under the auspices of the Water Supply Board. The main features were: The large Scituate storage reservoir formed by a dam across the Pawtuxet River, 3200 feet long and 100 feet high, a 7-mile aqueduct connecting the reservoir with the new filtration plant; and the 7-mile Neutaconkanut Conduit connecting the aqueduct with two covered reservoirs, the Neutaconkanut for low pressure and the Longview for high pressure. The Scituate Reservoir had a storage capacity of 37,421,000,000 gallons, an area of 3600 acres, an average depth of 32 feet, and a flow line 284 feet above the mean high water of Providence Harbor. In 1928 Providence had 129 day schools with an enrollment of 41,613 pupils; the assessed valuation of school property was \$9,741,740. During 1928, 1932 new buildings were erected at an estimated cost of \$13,172,494. A multiple-arch concrete bridge over the Seekonk River was under construction in 1929. In 1927, 42,735 persons were employed in 764 industrial establishments and received \$50,817,844 in wages; the value of products manufactured was \$214,616,951. Bank clearings in 1928 amounted to

\$813,885,000. The assessed valuation of property in 1928 was \$659,525,312; the net debt was \$28,367,864.

PRUSSIA. In the early part of 1914, there was a good deal of protest on the part of the Prussian Conservatives against the imperial policy of Bethmann-Hollweg, which they alleged worked to the prejudice of the position of Prussia in the Empire. The appointment of the Prussian Minister of the Interior, von Dallwitz, to the post of Statthalter of Alsace-Lorraine removed the most violent opponent of Prussian Franchise Reform; but the sanguine hopes which had been placed on his successor, von Lobell, were soon shattered by the latter's inaugural speech in the Diet, in which he stated that he had no intention of drawing up a Franchise Bill. The outbreak of the World War temporarily forced all internal questions into the background, but the problem of internal reform in Prussia could not long be ignored. On Jan. 13, 1916, the Chancellor appeared before the Prussian Diet with a promise of electoral reform, but stated at the same time that it must be deferred until the end of the War. The Government was forced, however, to abandon this position as a result of the changes in the foreign and internal situation during 1916 and 1917 and particularly in consequence of the ever-growing opposition of the Reichstag majority. Hence, the more liberal Hertling government, installed late in 1917, introduced during November of the same year reform measures which, while making certain progress in regard to electoral reform, curtailed substantially the rights of the Lower House in the matter of the budget. After much wrangling, the bill was finally adopted on Oct. 24, 1918, but then the situation had gone too far to be capable of being remedied by mere electoral reform.

The revolution of November, 1918, did away with the dynasty, Prussia's position of hegemony in Germany, and the personal union between the German and Prussian governments. A republic was proclaimed, the House of Lords was abolished and the Lower House dissolved. On Nov. 15, 1918, a ministry, consisting for the most part of Socialists, was appointed by the Executive Committee of the Workers' and Soldiers' Council. The result of the elections for the Constituent Assembly on Jan. 26, 1919, was as follows: Majority Socialists, 145; Independent Socialists, 24, Centrists, 88; Democrats, 65, German People's Party, 21; German National Party, 50, Hanoverians, 7. The revolutionary period proper ended with the convening of the Assembly on March 13 and the promulgation of a provisional constitution. Thereupon, the Socialist Hirsch formed a Coalition cabinet, consisting of Socialists, Centrists, and Democrats, which was succeeded, after the Kapp Putsch in March, 1920, by a similarly constituted Coalition ministry under the Socialist Braun. The new constitution of Prussia was completed by the Assembly after many difficulties on Mar. 30, 1920. It was drafted under the decisive influence of the constitution of the Reich and merely carried out the instructions of the latter. In it, the attempt was made to bring about closer union with the Reich and far-reaching decentralization within Prussia. When the elections for the Diet in February, 1921, resulted in a strengthening of the extreme Right and Left, the formation of a new ministry was made very difficult and only on April 22 did the Centrist, Fehrenbach, suc-

ceed in forming a coalition of Centrists, Democrats, and experts. In the Braun ministry of November, 1921, this coalition was broadened so as to include the Socialists and the People's Party. As a result of the election of December, 1924, Herr Braun was able to maintain his position as Prime Minister.

Prussia suffered severely under the Peace Treaty of Versailles. She lost the Province of Posen, the larger part of West Prussia, parts of East Prussia, Silesia, Schleswig-Holstein, and the Rhine Province, in all 56,000 square kilometers with approximately 4,700,000 inhabitants. See GERMANY, *History*.

PSYCHOANALYSIS. See PSYCHOLOGY; CONSCIOUSNESS AND THE UNCONSCIOUS; *ÆSTHETICS*.

PSYCHOLOGY. A historian of contemporary psychology has an exceedingly difficult task because of the many new and sometimes revolutionary movements that have developed, especially during the period since 1914. These movements, bringing with them new conceptions of old problems, cannot be evaluated with any degree of assurance. There is the so-called Behaviorism (qv) which limits the data of psychology to overt observable behavior and the stimuli that give rise to them. In its extreme form, it denies the existence of consciousness, and in its milder forms refuses to be concerned with consciousness. It rules out of existence the process of introspection as a means of gaining insight into behavior. This point of view is reflected in more than one of the current textbooks of psychology.

Equally startling in its influence upon systematic psychology is the attack upon instincts as the motivating forces in human nature. In the preceding decade, there had been a pronounced shift away from a descriptive, and toward a dynamic, psychology characterized by a search for causes. Instincts offered themselves as such causes, and interest was directed toward the cataloguing of them and determination of the ways in which they could be modified and developed into the mature individual. Now, the concept of instinct (qv.) has been seriously questioned, and in its place has been put the reflex (Kuo) or groups of reflexes (Allport). This change is having its effect upon current psychological doctrine.

The concept of conditioned reflex (see BEHAVIORISM) introduced by the physiologist, Pavlov, supported the battle against the instincts by assuming reflexes to be the real native behavior units which are elaborated into more complex forms of behavior through a process of conditioning. More than that, the conditioned reflex appeared to furnish a simple substitute for all the laws of learning envisaged under the concept of association. It provided for unconscious learning and pushed the period of active learning back into the earliest days of infancy. The conditioned reflex has found its widest acceptance in the realm of animal psychology and has also had much influence upon the character of human psychology.

Gestalt psychology (see PERCEPTION) has made its impression not only upon the theories of perception, but upon the whole subject matter of psychology. *The Growth of the Mind*, by Kurt

Koffka (1924), is a psychology built upon Gestalt concepts. Particularly pronounced are the changes in the learning process as conceived by this new school.

The active development of the mental-measurement movement (see MENTAL MEASUREMENT) since 1914 has left its stamp upon the character of systematic psychology by turning attention to practical problems where mental tests were called for, and by forcing attention upon the need for suitable concepts to serve as the foundation stones for the whole mental-measurement structure. Thus, we find psychologists interested in the problems of vocational selection and guidance, of adjustment of the individual in industry, of the mental defective, of the superior child, of the elementary and college students, and the factors upon which their success depends. This major interest has had a pronounced effect upon the content of modern psychology.

The measurement of intelligence, of character, of temperament, of personality, and of special aptitudes has led to excursions into the theory of mental organization. Numerous concepts have arisen out of the studies of Charles Spearman (see *Abilities of Man*, 1927), of Thorndike, and many others, such as the concept of general factors, the concept of special factors, and the concept of group factors. Experimental research has been stimulated to determine whether such traits as intelligence, perseverance, accuracy, speed, and memory are general, special, or group factors. Special statistical techniques have been created as tools for the solution of these problems, and have become a part of the subject matter of psychology.

The psychoanalytic movement (see PSYCHOLOGY, ABNORMAL, AND PSYCHOANALYSIS) has left a very definite mark upon current trends. Its emphasis upon unconscious mechanisms (see CONSCIOUSNESS AND THE UNCONSCIOUS), upon dreams and their interpretation, upon emotional shocks and their lasting impressions, and upon a unique form of reeducation, has given rise to the term "new psychology" because to superficial observation the psychology of the psychoanalyst bears little or no resemblance to orthodox psychology. Even where the "new" has not been accepted, its influence has been felt in the introduction of terms and ideas which have been borrowed from it.

The philosophers, too, have contributed their share to the apparent confusion by their concepts of vitalism, mechanism, purposivism, realism, etc., which they try to postulate as the principle underlying the systems of the psychologist.

These rapidly developing, changing, and conflicting points of view in psychology are not to be taken as signs of disintegration, but as signs of growth. The last 10 or 20 years have seen changes equally revolutionary occurring within the sciences of physics and chemistry. The fundamental facts and laws of physics are just as unstable as are the concepts of instinct and the laws of learning; but no one fears for the future of physics. No more should fears and misgivings arise concerning the future of psychology.

In the midst of this variety of viewpoints, numerous textbooks and systematic treatises have appeared, so that one can find a book strongly influenced by any one of the above-mentioned movements. As a result, the question has arisen as to what should be presented to

the student as the real subject matter of psychology. Conferences and symposia have been held on a number of occasions with the purpose of finding a body of knowledge which will underlie or be common to all the varied points of view. Their progress is encouraging.

A most instructive insight into current psychological doctrines may be gained from "Psychologies of 1925," a series of papers prepared by nine well-known psychologists, Madison Bentley, Knight Dunlap, J. W. Hunter, Kurt Koffka, Wolfgang Kohler, William McDougall, Morton Prince, J. B. Watson, and R. S. Woodworth. The topics include behaviorism, dynamic psychology, gestalt psychology, purposive psychology, reaction psychology, and structural psychology.

There remains to be mentioned an interesting effort to produce a psychological system which will cut across all mere "movements" and rest upon a series of fundamental facts and principles. *Psychology: Its Facts and Principles*, by H. L. Hollingworth (1928), "presents a systematic descriptive account of mental phenomena and of psychological processes. The phenomena are subjective events; the processes are redintegrative sequences in nature. It is not easy to characterize the view here presented in terms of contemporary 'isms.' The book aspires to a straightforward description of certain aspects of nature, rather than to the defense of a prejudice. Although descriptive, the view is not that of 'structuralism.' It does not deal with a reputed dependent realm of 'mental contents' or 'conscious elements.' Its psychology is dynamic, in that it deals with activities, processes, occurrences, rather than with static cross-sections of mental life.

"But neither is it 'mere behaviorism,' since it refuses to limit itself to the account of visible changes (movements). It shuns the visual bias of behaviorism; it insists that aches and pains receive the consideration to which their occurrence entitles them. Algesic patterns (pains), as well as visual patterns (animals), 'behave' In contrast with behaviorism, the book offers a social report, based on all the evidence of all the available reporters; at least it advocates such a report. It is neither intimidated nor discouraged by the descriptive difficulties of any event in nature

"The point of view is not that of 'associationism.' Although there may be superficial resemblances, the contrast is striking. Mental activities, as here described, do involve association; but two important divergences from classical associationism are apparent throughout. It is not 'mere ideas' that are connected, but primal events in nature. Some of these are ideas, but not the images nor psychic entities of historic tradition. Ideas are natural events, partial details of larger contexts, for which they function as equivalents in the course of mental procession. And they are ideas only when they thus operate, as instigating cues. Ideas do not arouse their former totals. Instead, they act as adequate surrogates for these in the instigation of consequences which may or may not be ideas.

"Since this is a textbook of psychology, it resolutely stands by its title. It has no chapters on neuro-anatomy, the physiology of the nervous or other systems of the animal body, or the structure of the sense organs. It finds plenty of honest psychological material at hand and cannot even grant space for many relevant suggestions concerning practical applications."

Bibliography. More notable publications of the period since 1914 were: G. S. Brett, *History of Psychology* (3 vols., 1912-21); Walter S. Hunter, *General Psychology* (1919); E. B. Holt, *The Freudian Wish* (1915); Wolfgang Köhler, *Die Physischen Gestalten in Ruhe und im stationären Zustand* (1920); Kurt Koffka, *Beiträge zur Psychologie der Gestalt* (1919) and *The Growth of The Mind* (1924); Oswald Külpe, *Vorlesungen über Psychologie* (1920); E. D. Martin, *Psychology* (1924); William McDougall, *An Outline of Psychology* (1923); Gardiner Murphy, *History of Psychology since 1800* (1929); Charles Rahn, *Psychological Review Monographs*, "The Relation of Sensation to Other Categories" (vol. xvi, no. 67); Bertrand Russell, *The Analysis of Mind* (1920); G. Dumas et al, *Traité de Psychologie* (vol. i, 1923); Knight Dunlap, *Outlines of Psychology* (1923); Charles Spearman, *The Nature of "Intelligence" and the Principles of Cognition* (1923); E. B. Titchener, "Act and Function," *American Journal of Psychology*, vols. xxxii, xxxiii, John B. Watson, *Psychology from the Standpoint of a Behaviorist* (1919); James Ward, *Psychological Principles* (1918); H. C. Warren, *Human Psychology* (1919); R. S. Woodworth, *Dynamic Psychology* (1921); J. F. Dashiell, *Fundamentals of Objective Psychology* (1928); H. L. Hollingworth, *Psychology: Its Facts and Principles* (1928). PSYCHOLOGY, ABNORMAL AND PSYCHOANALYSIS. If one accepted the standard division of knowledge into theoretical science and applied science, one might suppose that abnormal psychology were the concrete application of the data and laws furnished by general or systematic psychology. In actual fact, this supposition is not entirely borne out. So far from borrowing its material exclusively from general psychology, abnormal psychology and its derivative, psychoanalysis, have furnished a new approach to the problems of mental behavior. The trend of thought known as the "new psychology," even with its exaggerations and unsupported generalizations, may be put down to the credit of psychiatrists who were able to combine clinical knowledge and therapeutic skill with genuine philosophic insight.

The main distinction between abnormal psychology as an application of the theoretical science of psychology and psychiatry is that the former looks upon abnormalities as deviations of greater or less magnitude from the normal. (See E. G. Conklin, *Principles of Abnormal Psychology*, 1927.) The psychiatrist begins with the classical mental derangements and gradually extends his interest more and more toward the milder distortions of the mind until he includes the normal also. (See A. J. Rosanoff, *Manual of Psychiatry*, 1927.) The products reached by these opposing methods differ so much that the psychological system derived by the psychiatrist and the psychoanalyst has been called the "new psychology."

Among the class of psychiatrists may be included Charcot and Janet in France, Freud in Austria, and Morton Prince and Boris Sidis in America. Different as are their various theories on specific problems, these psychiatrists

are yet at one in their refusal to reduce them to the materialistic system of psychology. They affirm the specificity of psychological phenomena and the necessity of an explanation of such phenomena in terms of psychological conceptions rather than in terms of an unknown structure of the cortex and body nerve tissue. This is not to say that one attempts to explain phenomena in terms of new psychical or spiritistic entities but rather in terms of the meanings which particular objective events have for particular individuals in particular circumstances. Just as when we seek to account for the effect the reading of a particular book had on a particular person, we find the objective facts about ink and paper of little importance and must attempt to envisage the subjective meanings aroused by the contents of the book; so psychologists have come to realize that it is of no purpose to study events as mere physical shocks on a physical system without taking into account the emotional contexts, the meanings more or less individual to the particular organism.

To describe this type of meanings, many psychologists and physicians have preferred to use the notion of function, and they thus speak of certain psychological troubles as functional neuroses; but whether this term is adopted or not, it has been found that there was only one method of studying the phenomena in question and that was for the psychiatrist to familiarize himself, by patient questioning and clinical observation, with the inner history of the trouble. This leads us to another observation; namely, that knowledge and theories of this sort—dependent, as they are, very largely upon the artistic insights of the physician and psychiatrist—cannot have the same positivity as the observations of physical science. Freud himself recognized this fact when he wrote (in his *Introduction to Psychoanalysis*) that "it would be an error to suppose that a science is composed only of theses rigorously demonstrated, and it is a mistake to demand this." Janet said much the same thing when he pleaded for psychologists not to consider psychology as a science (in the same sense that physicists use the term) but rather as a collection of monographs.

Now the difficulty of the psychoanalytic technique is that it employs both of these schematisms. The psychoanalyst tries to be both a scientist, dealing not in advice but in observed correlations of fact, and a philosopher-confessor who assists his patient in the pursuit of happiness. Professor Janet, in reporting to the French Academy of Medicine on the doctrines of Freud, pointed out that psychoanalysis at times lays claim to an entire system of ethics. In a certain sense, it is true, neither the psychiatrist nor the physician escapes that responsibility. The analysis of human nature is too close to the aspirations of human nature to avoid involving the latter; but the scientific and ethical responsibility must be distinguished and recognized for what they are.

The war cases of shell shock have disproved, in an objective way, the extreme Freudian thesis that sex disturbances (in the more specific sense) are the cause of neuroses. They revealed a rather new type of neuroses with preoccupations very different from those of civilian cases and reflecting quite definitely the war anxieties. They also served to disprove the mechanistic, physiological conception of the so-called functional nerve diseases.

With the destruction of the extreme Freudian thesis and the dogmatic physiological contention, no specific theory of neuroses has been left standing. In France—where psychological thought has never accepted either of these theses—an attempt was made by a brilliant writer, Dr. Albert Deschamps, to exploit the theory of fatigue as the *raison d'être* of the general type of neurasthenic diseases. Both the theory and the cure which it proposed harked back to the famous rest treatment of Weir Mitchell, which was very popular among psychiatrists a generation ago; but like so many other theories in abnormal psychology, the conception of fatigue and insufficiency of nervous energy was seen to be a valuable partial truth which permits the observer to understand the concrete nature of a particular class of cases, but which is misleading when generalized into what amounts to a metaphysical conception.

The question may well be asked why such partial truths do not sooner or later find their place in a systematic classification, such as obtains in the natural sciences; why, for instance, there is not as complete a table of mental diseases with more or less empirical specifics as is the case in physiological therapeutics. The answer is to be found in the entire absence of a spatial form of representation, a circumstance which makes every mental concept, every mental theory, an elusive metaphor. In the domain of the mind, we come in contact with truths in a manner not very different from scents and odors. That is why the science of the mind, necessarily different from the science of matter, comes in the long run to have no other criterion than the cultivated taste of the connoisseur.

Doubtless because of the frailty of the subject matter, the theories of psychoanalysis were subject to grave misunderstandings. On the one hand, the worshippers of clear and precise ideas were scandalized at the fleeting nature of some of the intuitions, but on the other hand many advocates of the psychoanalytic doctrine more than made up for this by bringing rather too much precision into their science. They could do this only by constructing a metaphysics of the sex instinct and its symbolization. In this metaphysics, complexes and symbols were treated sometimes as dynamic concepts (i.e., with fluid meaning), sometimes as static concepts on a par with those of the physical sciences. An ambiguity of this type is practically unavoidable, for such notions as symbol and complex carry with them this ambiguity in their philological meaning.

We need only remember that the earliest philosophers to use the notion of symbolism, the Pythagoreans, slipped very naturally into the error of confounding the metaphorical act of symbolization with symbols as static entities representing other objects. Similarly, the association psychologists confounded the dynamic act of association or growth of meaning with association viewed externally as a mechanical process, and therefore describable by laws; and inasmuch as the idea of complex is practically identical with association, it is readily seen how psychoanalysts fall into the same ambiguity.

For the purpose of inference, it is necessary to treat some of these concepts statically as if they were obeying the laws of mechanical causality; but when that is done, the results must be tested by empirical facts and not by means of the semi-aesthetic, symbolic intuitions.

Thus, it is one thing for a commander of military troops to treat sex as a mechanical, almost material problem, on a par with food supplies and munitions. It is quite another thing for a psychoanalyst, tracing genetically the rise and fall of sentiments in a human individual, to discover what he calls transferences or sublimations of the sex instinct. In the first instance, we are treating man as a machine with definite springs which behave in definite fixed ways, and sex is one of those springs. Such a conception is an abstract one, and scarcely fits the facts even in a limited situation. However, it is a precise conception and allows itself either to be verified or denied by empirical facts. In the second case, sex ceases to be a definite thing at all and becomes a sentiment—"an aspiration after happiness," to quote Rémy de Gourmont, "than which nothing is less definite." And the many gropings, the many expressions of the ultimate libido, are not so much causes of one another as contingent temporal sequences. In order to show a relation of causality in the intellectual or scientific sense, it is necessary to have a limited situation in which an observed sequence, after being purified, so to speak, of its arbitrariness and subjectivity, has been experimentally confirmed.

PSYCHOLOGY, EXPERIMENTAL. A legitimate distinction can no longer be drawn between experimental psychology and psychology, for the psychology of today which deserves to be called scientific is psychology based upon experiment. The term "experimental psychology" originated in the time of Wundt when he introduced the methods of physiology into a psychology which was primarily philosophical speculation. Today, psychological theories grow directly out of laboratory investigations or, if they develop independently, are at once put to a laboratory test and survive or fall upon the findings. Thus, the very movements which are at the focus

of attention in psychology (see **PSYCHOLOGY**), such as Gestalt, conditioned reflex, behaviorism, etc., form the subject matter of laboratory research.

In addition to these newcomers in the field, the more classical experiments remain the objects of interest. Thus, the psychophysical methods for determining the limits of discrimination for the various senses which were studied in the earliest psychological laboratory (that of Wundt in Leipzig) are still being investigated. Attempts are being made to equate these methods of average error, constant stimuli, right and wrong cases, etc., so that the findings by one method may be directly compared with the findings by another method. Most psychological laboratories are likewise engaged upon the study of various sense experiences, which also formed the subject matter of the earliest laboratories (see **VISION**; **AUDITION**; **TASTE AND SMELL**; **SENSATION**, **CUTANEOUS AND ORGANIC**). Investigations of vision and audition are particularly active. Laboratory workers have taken advantage of recent inventions for sound production and control in the fields of the telephone and the radio, and researches are being repeated with the higher degree of accuracy made possible by these new devices.

New devices have been drawn into service particularly in the study of the emotions where the introspective method has given way to objective recordings by means of the X-ray, the motion picture, the galvanometer, and the oscillograph. The application of these methods is just beginning to bear fruit, in the analysis of emotions into their essential components and the determination of the relation of the external stimuli to glandular and neural mechanisms.

PUCCHINI, pōōt-ch'ē'nē, GIACOMO (1858-1924). An Italian operatic composer (see Vol. XIX). *La Rondine* was produced at Monte Carlo (March 27, 1917), but met with little success. The première of his next work, a triptych consisting of *Il Tabarro*, *Suor Angelica*, and *Gianni Schicchi*, took place at the Metropolitan Opera House (Dec. 14, 1918). Of these, only the third has maintained itself in the repertory. His last work, *Turandot*, was all but finished, when the composer underwent an operation for cancer, from the effects of which he died in Brussels, Nov. 29, 1924. From Puccini's sketches, Franco Alfano completed the finale of the opera, which was produced in Milan on Apr. 25, 1926. The American première took place in the same year at the Metropolitan Opera House (November 16). The enthusiasm manifested at the first performances abated considerably, when the public began to realize that they had been dazzled by brilliant stage effects rather than by great music. Consult A. Wiessmann, *Giacomo Puccini* (Munich, 1922); Gino Monaldi, *Giacomo Puccini e la sua opera* (Milan, 1924); A. Frac-caroli, *La Vita di Giacomo Puccini* (Milan, 1925).

PUEBLO INDIAN LANDS. See **INDIANS**. **PUEYRREDON**, HONORIO (1872-). An Argentine diplomat and public official. Trained for the practice of law at the University of Buenos Aires, he entered politics and served two

years as Minister of Agriculture and six years as Minister for Foreign Affairs previous to his appointment as chief representative of Argentina in the League of Nations Assembly in 1920. He was largely responsible for his country's withdrawal from the League in the same year. He was Ambassador to the United States from 1923 to 1928, resigning following the Pan-American Conference at Havana in the latter year, at which he was president of the Argentine delegation. He stated that his resignation was due to the refusal of the delegates to the conference to include in a proposed convention of the Pan American Union an article pledging the Union to use its influence to break down artificial tariff barriers. At the same conference, he vigorously attacked the United States tariff system.

PULP, WOOD. See PAPER AND WOOD PULP and FORESTRY.

PUPIN, MICHAEL IDVORSKY (1858-). An American physicist and university professor (see VOL. XIX). In 1925-26 Professor Pupin was president of the American Association for the Advancement of Science and of the American Institute of Electrical Engineers. In 1928 he was awarded the Washington Medal (engineering). He is the author of *From Immigrant to Inventor* (an autobiography, which was printed in six different languages, 1923), and *New Reformation; from Physical to Spiritual Realities* (1927).

PURDUE UNIVERSITY. A State technological institution founded in 1869 at West Lafayette, Ind. The number of students increased from 2341 in 1914 to 4150 in 1928, the members of the faculty from 185 to 478, and the library from 40,000 to 85,000 volumes. Revenue and appropriations for the support of the university were correspondingly increased during the period from \$479,251 to \$4,349,454.34. A department of forestry in the school of agriculture and the agricultural experiment station were established. Advanced military training was introduced into the junior and senior years of all schools. Buildings costing more than \$1,700,000 were erected during the period. These included the armory, in 1918, the home economics building, in 1923; Stanley Coulter Hall

for the biology department, in 1917; a recitation hall for the departments of education, history and economics, and mathematics; a veterinary building; a horticultural greenhouse; a campus greenhouse; a locomotive museum; Franklin Levering Cary Memorial Hall, a men's residence; headquarters for the department of horticulture, the department of poultry husbandry, the schools of chemical engineering and the school of electrical engineering, for a summer surveying camp; a heating and power plant, the American Railway Association draft-gear test building; the Ross-Ade Field buildings for the athletic offices; and buildings for the farm of the school of agriculture. President, Edward C. Elliott, Ph.D. LL.D.

PUTNAM, HERBERT (1861-). An American librarian (see VOL. XIX). In the World War, Dr. Putnam served as general director of the American Library Association's Library War Service. In 1929 he received the Roosevelt Medal for Distinguished Service, having completed 30 years as Librarian of Congress. In this connection, there were published *Essays Offered to Herbert Putnam by His Colleagues and Friends on His 30th Anniversary as Librarian of Congress, April 5, 1929*, edited by William Warner Bishop and Andrew Keogh (New Haven, 1929).

PUTNAM, NINA WILCOX (MRS. ROBERT J. SANDERSON) (1888-). An American author, born in New Haven, Conn., and educated privately. She began writing at the age of 11. Her books include *Esméralda* (1918); *It Pays to Smile* (1920); *West Broadway* (1921); *Laughter Ltd* (1924); *Say It with Bricks* (1923); and *Easy* (1924). She has been a frequent contributor of popular short stories to the leading magazines.

PUTZ, LEO (1869-). A German painter of allegorical subjects, fairy tales, and portraits who was born in Meran and studied in Munich and in Paris with Julian Bougereau and Benjamin Constant. He was a professor in the Munich Academy. He is represented in the galleries in Frankfurt, Munich, and Budapest, and as the illustrator of many editions de luxe.

PYRITE. See SULPHUR.

PYROTECHNICS. See ORDNANCE; TRENCH WARFARE MATERIAL.

Q-SHIPS. See VESSELS, NAVAL.
QUACKENBOS, JOHN DUNCAN (1848-1926). An American physician and authority on hypnotism, born in New York City. He took his degree in arts at Columbia University in 1868, and was graduated in medicine from the College of Physicians and Surgeons of Columbia in 1871. Until 1894 he taught rhetoric and history at Columbia, retiring then to devote himself to medical practice with special emphasis on mental and characterological anomalies and the application of hypnotism in their treatment. He published *Hypnotic Therapeutics*, a monograph (1908), *Body and Spirit* (1916), and *Rational Mind Cure*.

QUANTUM THEORY. See CHEMISTRY; PHYSICS

QUARANTINE, PLANT. See ENTOMOLOGY, ECONOMIC

QUARRIES, UNITED STATES. See STONE.

QUEBEC. A Canadian province with an area of 594,434 square miles and a population of 2,361,199 in 1921, a gain of 17.7 per cent over the 2,005,776 of 1911. An official estimate placed the population June 1, 1929, at 2,690,400. The rural population has continued to fall off, in 1921 only 44 per cent of the total population living in rural districts, as compared with 51.8 per cent in 1911. In 1921 males numbered 1,180,028 and females 1,181,171. In 1926, 93 per cent of the population were Canadian born and of these 82 per cent were of French, and 13.5 per cent of British, stock. By the 1911 census, 316,103 of the inhabitants were of British, and 1,605,339 of French, descent. There were 442,356 families in 1921, as compared with 307,304 in 1901. Populations of the largest cities in 1926 were Montreal, 1,300,000 (490,504 in 1911); Quebec, the capital, 165,000 (78,710 in 1911); Hull, 35,233 (18,222 in 1911); Verdun, 42,247; Three Rivers, 35,000; Sherbrooke, 25,021.

Industry. Agriculture is the basic industry of the province. The total area under cultivation in 1927 was estimated at 6,877,900 acres and the value of the crops at \$144,273,000. Hay and clover, oats, potatoes, buckwheat, barley, and spring wheat are the most important crops. Fruit culture is flourishing, as is the maple-sugar and -syrup industry which averages about \$4,000,000 annually (1927, \$3,105,924, as compared with \$1,600,000 in 1913). In 1920, 17,252 acres were under tobacco, but the tillage fell off to 9808 acres in 1927. The live-stock industry continues to expand, milch cows increasing from 761,816 to 1,064,470; other cattle from 693,540 to 836,193; sheep from 602,751 to 852,439; swine from 661,768 to 808,706. Dairying, always an important industry, brought in \$29,539,376 in 1927 in cheese, butter, and other products. Lumbering produced \$16,431,280 worth of cuts of lumber in 1921. The manufacture of pulp and paper products leads

the Dominion. In 1926 \$59,218,576 worth of wood was used in the manufacture of wood pulp while paper products totaled \$121,290,231. In 1926 the fish catch brought in \$3,110,964; in 1913, \$1,988,241. The mineral yields have only barely tapped the vast resources of the province. In 1927 the total mineral production was \$29,211,000, as compared with \$11,836,929 in 1914. Asbestos (\$10,621,517 in 1927), cement (\$4,535,386 in 1926), and limestone are the chief minerals. The industrial development of the Province has been marked, the census of 1926 showing 7164 establishments, with a capital investment of \$1,216,975,958 (\$378,441,000 in 1913), and \$905,300,824 the value of the production (\$406,167,950 in 1913). The number of employees was 180,659 and salaries and wages paid, \$189,326,145. The leading industries in order are pulp and paper, wood, lath, etc., cottons, flour-mill products, leather, shoes, tobacco, butter and cheese, meat packing, clothing, shipbuilding, housebuilding, and rolling mills. The estimated water power of the province totals probably 8,459,000 horse power of which 2,064,723 horse power has already been developed, all by private capital.

Trade and Communications. In 1927 there were 4868 miles of railway, as compared with 4043 miles in 1914. Total imports for consumption in 1927-28 amounted to \$305,065,264 (\$187,301,493 in 1912-13), exports, to \$362,860,712 (\$147,723,907 in 1912-13).

Government. Revenues for 1913-14 were \$9,000,377; expenditures, \$8,624,368, by 1926-27, these had reached. revenues of \$30,294,997 and expenditures of \$29,078,703. The provisional figures for 1928 were revenues, \$31,000,000; expenditures, \$28,000,000. While the Dominion subsidy has remained the same, larger revenues are derived from the succession and commercial-corporation taxes. In June, 1928, the funded debt was \$58,827,532 (\$24,579,166 in 1914). In 1926 Quebec had 8116 schools of all kinds, with 597,364 pupils and 22,868 teachers. All schools are sectarian. The total expenditure for all education in 1925-26 was \$28,980,568, as compared with \$9,255,771 in 1913. In the Dominion Parliament, representation is. House of Commons, 65, Senate, 24. Of all the Canadian provinces, Quebec is the only one in which women are not enfranchised or permitted to stand for the Legislature of the province.

QUEBEC. A port of entry of Canada and the capital of the Province of Quebec. The population at the census of 1926 was 126,000, in 1929 it was estimated to be 135,000. The area is 6380 acres. The port of Quebec, which is the terminal for 14 principal steamship lines, provides accommodation at one time for 22 large ocean-going vessels. The number of vessels entering the port increased from 601 with a total tonnage of 3,588,530 in 1922 to 1641 with a total tonnage of 8,340,617 in 1928. Port facilities include two dry docks which will accommo-

date the largest vessels afloat and two grain elevators, one of which has a 2,000,000-bushel capacity with a loading capacity of 60,000 bushels per hour. In 1929 a grain-storage annex with a capacity of 2,000,000 bushels was constructed. The amount of grain exported in 1928 amounted to nearly 10,000,000 bushels. The harbor, which extends 15 miles along each bank of the St. Lawrence River, is administered by a commission of three members appointed by the Dominion government under the supervision of the Department of Marine and Fisheries. In 1929, \$13,500,000 was being spent by this commission for the extension of wharves and improvement of transportation facilities. In 1917 the Quebec Bridge, the largest cantilever bridge in the world, was completed at a cost of \$25,000,000. The total length of the bridge is 3239 feet, its width, 88 feet; height above pillars, 310 feet; length of cantilever, 1800, length of centre span, 640 feet, height of centre span above high tide, 150 feet. The total weight of the metal structure is 66,480 tons. It carries a double-track railway and accommodation for foot traffic. Since the completion of the bridge, Quebec has become an important railroad centre, two transcontinental railways and six subsidiary lines radiate from the city. In 1928 voters approved an expenditure of nearly \$4,000,000 to effect such urgent improvements as the widening of streets, the opening of new ways of communication between the various parts of the city, and the construction of a new bridge over the St. Charles River. Approximately 10,000 persons were employed in 1928 in Quebec's 225 industrial establishments and received \$8,000,000 in wages; the value of products manufactured was \$33,000,000. Quebec has 47 banks and branches; bank clearings in 1928 amounted to \$361,754,089. Since 1921, 2556 new buildings valued at \$30,555,072 have been erected. The assessed valuation of property in 1928 was \$169,803,727; the net debt was \$17,963,945.

QUEEN'S COLLEGE. A college for women at Charlotte, N. C., founded in 1771; nonsectarian in purpose, but under the direction of the Presbyterian Church. By the autumn of 1928, the enrollment had increased to 319, and the faculty to 32 members, including a vice president and assistant in modern languages who were added in 1927. The library contained 9000 volumes. A new building providing refectory and dormitory accommodations was added in the summer of 1927. The college income for the year 1927-28 was \$130,000. President, William H. Frazer, D.D., Litt. D.

QUEENSLAND. A state of the Commonwealth of Australia occupying the northeastern part of the continent. Area, 670,500 square miles; population, in 1911, 605,813; in 1928, 914,471, average annual increase, 2.52 per cent. Brisbane, the capital, including suburbs, had 295,430 inhabitants in 1927. Of the total area of the state, 94 per cent still remains unpreempted. Gross production in the Province in 1926-27 totaled £54,418,413, divided as follows: agriculture, £12,181,917; dairying, poultry, and beekeeping, £5,456,336; pastoral, £15,927,429; mining, £1,787,527; forestry, fisheries, etc., £2,556,454; manufacturing, £16,508,750. Leading agricultural activities centre in the planting of maize, wheat, hay, and sugar cane. Pastoral pursuits continue to be important. The wool output in 1926-27 was 119,847,967 pounds, valued at £9,423,046 (136,878,270 pounds in 1912-13). Sugar in particular has shown increases,

the yield in 1927 being 3,555,827 tons of cane, as against 1,135,120 tons in 1912-13. Total value of minerals in 1912, £4,175,355, in 1920, £3,462,214; in 1927, £1,787,527. Gold continues to decline, dropping from £1,128,868 in 1913 to £161,321 in 1927. Coal is the only mineral to show important gains. Imports for 1916-17 and 1927-28 were £6,263,102 and £11,758,358; exports for the same years were £14,542,270 and £21,854,945. Government accounts showed revenues and expenditures for 1913, £6,378,213 and £6,372,097; the same for 1927-28 were £16,718,070 and £16,707,564. The debt mounted from £55,023,506 in 1914 to £111,733,969 in 1928. Here, as in New South Wales, the Labor Party continues the most powerful group. In 1922, as a result of continuous agitation, a referendum decided for the abolition of the legislative council.

QUEZON, MANUEL L. (1878-). A Filipino political leader and advocate of independence. Educated at San Juan de Letran College, Santo Tomas University, and the Dominican University, Manila, where he took a degree in law, he commenced the practice of law in 1903 and in 1904 was elected Governor of his native Province of Tagabas. He became successively a member and floor leader of the House of Representatives (1907), resident commissioner in the United States (1909), chairman of the Philippines Independence Mission, and president of the Filipino Senate, an office which he held continuously after 1916. Although he had served as a major in the native forces during the Philippine insurrection, he supported the United States during the World War. He was the leading opponent of the policies of General Leonard Wood during the term of the latter as governor general.

QUICKSILVER. The production of quicksilver was somewhat stimulated by the World War. In 1917 the world output reached a maximum of 4195 metric tons, though it declined to 2135 metric tons in 1921, as a result of the post-war depression. Since 1921 quicksilver prices have steadily improved, as has production with the exception of a slight recession in 1924. Output figures from the principal producing countries indicate that the 1917 record output has been surpassed by a considerable margin. Italy has been the largest producer of quicksilver in recent years, though closely followed by Spain. These two countries contribute between 80 and 90 per cent of the world's supply. The governments of both Spain and Italy are closely allied with the quicksilver properties and in 1928 the two interests combined to form a cartel for controlling production and prices.

The result of the high prices for quicksilver prevailing in recent years has been to stimulate production in the United States and other countries, and to encourage the use of substitutes for industrial purposes whenever possible. Commercial uses of quicksilver are numerous. One use that is increasing steadily in importance is the production of mercury-arc and mercury-vapor lamps and rectifiers. The uneven distribution of the world's supply of quicksilver appears to be working against the possibility of any general adoption of the Emmet-type mercury boiler recently developed by Dr. W. L. R. Emmet of the General Electric Company. Possible users of the mercury boiler appear to fear any great dependence on the foreign sources of supply. See **BOILERS**.

A feature of the recent increasing production of the United States has been the growing importance of the State of Nevada as a producer. Early in 1920, the output of the three largest producers in Nevada was estimated to be at a rate but slightly less than that of the entire State of California which has been the principal source of the domestic quicksilver supply. The production in 1928 amounted to 16,838 flasks of 75 pounds each with a total value of \$2,052,215, being the largest output since 1919 when 21,415 flasks valued at \$1,933,560 were produced.

AVERAGE PRICE OF QUICKSILVER IN NEW YORK IN DOLLARS PER FLASK OF 75 POUNDS
(From *Engineering and Mining Journal*)

1921	\$ 45 45
1922	58 95
1923	66 50
1924	69 76
1925	83 13
1926	91 90
1927	118 16 *
1928	123 51 *

* Price quoted per 76-lb. flask.

The distribution is given in the accompanying table. In 1928, 15,583 flasks of mercury, valued at \$1,572,017, were imported, compared with 24,650 flasks valued at \$2,189,495 in 1927. Of the 15,583 flasks imported in 1928, 6189 flasks were derived from Spain, 5718 flasks from Italy, 1816 flasks from Mexico, 913 flasks from Belgium, 546 flasks from Germany, and 401 flasks from the United Kingdom. In 1927, 13,663 flasks came from Spain, 9089 flasks from Italy and 1898 flasks from other countries. Production in the United States plus imports indicated 32,421 flasks made available in 1928, compared with 35,926 flasks made available in 1927.

QUICKSILVER PRODUCTION OF THE UNITED STATES

State	(In flasks of 75 pounds) (From <i>Mineral Industry</i>)		
	1926	1927	1928
California	5,726	5,748	6,711
Idaho	6		
Nevada	197	125	2,905 *
Oregon		2,082	2,848
Washington	489	566	
Alaska, Arizona, and Texas	1,224	2,455	4,374 *
Total	7,642	11,276	16,838

* In addition, 404 flasks were produced in Nevada from gold and silver.

* Includes Washington but not Alaska.

QUILLER-COUCH, kooch, SIR ARTHUR THOMAS (1863-). An English author (see Vol. XIX). He was King Edward VII professor of English literature at Cambridge University since 1912, and a fellow of the Royal Society of Literature. His later works were *News of the Duchy* (1915); *On the Art of Writing* (1916); *Memoir of Arthur John Butler* (1917); *Mortallone and Aunt Trinidad* (1917); *Foc-Farrell* (1918); *Shakespeare's Workman-*

ship (1918); *Studies in Literature* (1918, 2d series, 1922); *On the Art of Reading* (1920); *Charles Dickens and Other Victorians* (1925); and *On the Art of Writing* (1928). In 1925 he edited *The Oxford Book of Prose*.

QUILTER, ROGER (1877-). A British composer, born at Brighton. Having received his general education at Eton, he studied music under I. Knorr at Hoch's Conservatory in Frankfurt. He first attracted attention with his charming settings of the lyrics from *Twelfth Night* and *As You Like It*, which were followed by other lyrics from Elizabethan and Victorian poets. Several of the foremost English and American concert-singers included his songs in their repertoires, and thus gave them great and deserved popularity. Besides songs, he wrote *Serenade*; *Three English Dances* and *Children's Overture* for orchestra; incidental music to a fairy play, *Where the Rainbow ends*, and to *As You Like It*.

QUINIDIN. See HEART DISEASE.

QUINN, ARTHUR HORSON (1875-). An American university professor and historian of the drama. He was born at Philadelphia, Pa., and graduated at the University of Pennsylvania. He studied modern philology at the University of Munich (1897-98) and at the graduate school of the University of Pennsylvania (Ph.D., 1899), where he was successively instructor, assistant professor, and after 1908 professor of English. He was dean of the college faculty from 1912 to 1922. Since 1923 he has been a member of the board of the American National Theatre. He wrote *Pennsylvania Stories* (1899); *The Early Drama* (1917); *History of the American Drama from the Beginning to the Civil War* (1923); and *History of the American Drama from the Civil War to the Present Day* (1927). He has edited George Eliot's *Silas Marner* (1900); *The Faure Maide of Bristow* (1902); *Representative American Plays* (1917), Emerson's *Essays* (1920); Mark Twain's *Prince and Pauper* (1921); and *Contemporary American Plays* (1923). Mr. Quinn acted as general editor of Harper's *Plays and Playwrights' Series*.

QUINN, EDMOND T (1868-1929). An American painter and sculptor, born in Philadelphia. He was a pupil of the Pennsylvania Academy of Fine Arts and of Thomas Eakins, and in Paris, of Injalbert. He is represented in America by a statue of Zoroaster, at the Brooklyn Institute of Arts and Sciences; a bust of Edgar Allen Poe in Poe Park, New York; a statue of Edwin Booth in the character of Hamlet at Gramercy Park, New York; busts of Booth, Oliver Wendell Holmes, and Chancellor Kent in the Hall of Fame, New York, and the World War Memorial at New Rochelle, N. Y. He executed many portrait busts of prominent American men, and was a member of the council of the National Society of Sculptors.

R

RABAUD, HENRI (1873-). A conductor and composer, born in Paris. He was trained under Massenet at the Paris Conservatoire and in 1894 won the Prix de Rome with a cantata, *Daphné*. In 1908-14 he was conductor at the Opéra Comique and in 1914-18 at the Grand Opéra. In 1915 he was also appointed conductor of the famous Concerts du Conservatoire. During the season of 1918-19, he conducted the Boston Symphony Orchestra and in 1920 succeeded Fauré as director of the Paris Conservatoire. His works comprise the operas, *La Fille de Roland* (Paris, 1904), *Le Premier Glave* (Béziers, 1908), *Mârrouf, Savetier du Caire* (Paris, 1914; New York, 1917); *L'Appel de la Mer* (Paris, 1924); two symphonies; a symphonic poem, *La Procession Nocturne*, *Divertissement sur des Chansons Russes*; *Eclogue*; an oratorio, *Job*; a Psalm for soli, chorus, and orchestra; incidental music to *The Merchant of Venice*, *Antony and Cleopatra*, and St. Pierre's *Paul et Virginie*, *Hymne à la France Éternelle*; a string quartet; and other compositions of chamber music.

RACE PROBLEMS, UNITED STATES. Race problems are strictly not problems of race at all, since what are commonly termed such are not biological problems. They are rather problems of group conflict wherein the groups are characterized by racial, or more commonly, by national distinctions. Such social conflicts in the United States are those between the predominant whites with Negroes, Asiatics, and Indians, and between descendants of the older immigrants of predominantly north European origin with later comers of central and south European nationality and with Mexicans.

The period of the World War was one of intense national self-consciousness in which were aroused antipathies not only toward the enemy nations but toward all foreigners. By extension, this feeling aroused in the United States anew the bitter hostility toward Negroes. These sentiments were complicated by certain economic and social factors, notably the general prosperity of the war years which fostered a northward migration of Negroes, who were then in competition with northern whites. Although the economic crisis of 1920-21 brought this prosperity to an end for wage earners, many Negroes had by that time been absorbed in northern industry, and were developing a consciousness of their own worth. Since during the war years immigration from Europe was at a minimum, and Asiatic immigration having largely ceased, the supply of unskilled labor was drawn from Negroes and, somewhat later, from Mexicans. At the close of the War, the prosperity of the United States and the well-nigh hopeless outlook at home, caused Europeans to look again to emigration to America. Considerable apprehension was aroused in the United States over the possibility of being swamped with immigrants whose

competition might undermine American wage levels. There was also a less rational fear of the formation of foreign colonies, which were looked on as endangering national unity. Panicky alarm brought pressure on Congress to pass in 1924 legislation restrictive to immigration. This had the effect of reducing immigration. At the same time, the Oriental problem was stabilized, to the satisfaction of the Western States most concerned, by restrictive land laws. See IMMIGRATION.

The years 1920-24 constitute a turning point in race relations in the United States. With the opening of the War in 1914 came a recrudescence of animosities; with 1920-24 came the stop-gap measures, and since that date, with the frictions removed, there has been considerable dwindling of the old antagonisms.

Mexican immigration on a large scale is too recent to provide a source of conflict. It cannot be said that the older race problems are satisfactorily solved; they have rather of recent years lain quiescent. It is rather interesting that the aroused antagonisms of the war years passed by the Indians. This was partly due to the fact that they form a decreasingly minor fraction of the population.

A latent source of fresh conflict lies in the increasing influx of Mexican laborers into the Southwestern States, said to amount at present to about 70,000 additions a year. Since their immigration is encouraged, largely by local agriculturalists, there being no quota restrictions, there may be anticipated a gradual pushing northward of the frontier of Mexican culture. While there is at present no rankling conflict, there are possibilities, as in the case of the replacement of Negroes in the Texas cotton-fields by Mexicans.

An index of racial antagonism is found in current marriage laws. More than half the States have laws prohibiting marriage between members of diverse races. Of the 29, 14 are Southern States, six in the North and West. The majority of the miscegenation laws affect marriage with Negroes (all of the Southern States), seven of them with Mongolians (Mississippi, Missouri, and the Pacific and Mountain groups, except Washington), one (North Carolina) with Croatan Indians, while Nevada is most inclusive, forbidding marriage of whites with Ethiopians, Malays, Mongolians, and American Indians. Naturally, the operations of these laws as they affect Negroes, for example, depends on the definition of Negro. This is quite variable, but in general includes all persons with one-eighth or more of Negro blood.

There is some evidence that despite the increase of mulattos at the present time, that the white-Negro mixtures were largely in an earlier generation. That is, not only are the miscegenation laws effective in preventing intermarriage, but illegal matings seem to be on the decline. One reason for this is the growing group consciousness of the Negro, who is now more inclined to seek marriage among his own people.

An index of changing social conditions affecting the Negro can be inferred from the decrease in the number of lynchings and the increase in literacy.

LYNCHINGS					
	Total	Negroes		Total	Negroes
1911	71	62	1921	64	59
			1922	57	51
1916	54	50	1923	33	29
1917	88	36	1924	16	16
1918	64	60	1925	16	16
1919	82	75	1926	29	22
1920	61	53	1927	16	16

During 1921-27 lynchings were confined wholly to the Southern States, save for one in 1925 and four in 1926. The numbers for 1924, 1925, and 1927 are the smallest for any year since records were kept. There has been steady improvement since 1920.

Growth of sentiment against lynching in the South is evidenced by discussions in newspapers and formal resolutions of white groups. This was induced in part by the departure of vast numbers of Negroes to the North in the war years (see below). Efforts have been made, beginning in 1918, to have Congress pass a law making lynching a Federal crime. In 1920 the Dyer Bill was introduced in Congress, in 1921 it was killed by a filibuster of Southern Democrats, in 1922 it passed the House, but a Democratic filibuster in the Senate prevented its passage. In 1922 New Jersey and in 1923 Pennsylvania passed anti-lynching acts. It is noteworthy that Federal anti-lynching laws were proposed in the 1928 platforms of the Socialist, Republican, and Workers' parties.

Illiteracy is decreasing more rapidly among Negroes than in the country at large.

PERCENTAGE OF ILLITERATES	
Negroes	Total population
1880—70.0%	17.0
1890—57.1	13.3
1900—44.5	10.7
1910—30.4	7.7
1920—22.9	6.0

In 1920 only 53.5 per cent of all Negro children were in schools; in 1924, 68.4 per cent.

A tremendous migration of Southern Negroes to the Northern States took place during the World War and the years immediately following. It is estimated that more than 400,000 moved north within three years, principally in 1916-17. Within a period of 18 months in 1917-18, Chicago alone received an accretion of 50,000. Increases in typical mid-Western industrial cities, between the census dates 1910-20, ran: Cincinnati, 51 per cent (10,000); Gary, 1284 per cent (5000); Detroit, 623 per cent (36,000); Chicago, 148 per cent (65,000). The suddenness of the migration was startling, but was not a unique phenomenon. There had been earlier sudden movements from the lower Mississippi into Kansas in 1879, and into Arkansas and Texas in 1888-89. What is easily overlooked is that these mass movements were merely high points in a large and continuous drift to the North over 50 years, following on the heels of white migration to the West. The factors were largely the same as in the earlier movements, namely, economic depression in the South and more potently an escape from social restrictions and tyranny. But the 1914-20 migration differed in the economic opportunity offered Ne-

groes in the North; the sudden demand for unskilled labor due to cutting off of the European supply, coupled with an increase in wages. In 1915 Negro laborers in the South received 75 cents a day, skilled laborers \$2 to \$3.50. Fifty-six per cent received less than \$2 a day, while in Pittsburgh, for example, 62 per cent found wages of \$2 to \$3. Labor depression in the South in 1914-15 was followed by great damage to the cotton crop in 1915-16 and the depression of its price in subsequent years. Unusual floods in 1915 aggravated the situation. Wages did not advance as fast as food stuffs. This provided the immediate stimulus, but an equally potent factor was relief from the injustice, inequality before the law, and peonage of the South.

The most striking feature of the Northern migration was its individualism. Letters from the North, rumors, lectures, labor agents, all had their part. Particularly effective was the circulation of the *Chicago Defender*, which rose from 50,000 to 125,000 within 1918. This paper set a definite date for the "Great Northern Drive," May 15, 1917; the week following saw the heaviest rush to the North. The impulse to leave was irresistible; they fled as from a curse. Professional men moved largely because their clientele was gone. Inevitably, these migrants were disillusioned in the North, friction and clashes resulted, but the net gain for the Negroes was large. Concentration of Negroes under wretched conditions in the South was replaced by wide distribution in the North, with better economic and social opportunities. The effect in the South was to depopulate whole districts and increase wages for those who remained. When the South realized its position, a new social attitude, as well as a new economic policy, was created. This took tangible form in appropriations for schools, sanitary improvements, better housing, etc. "For those who remained conditions were more tolerable, although there appeared to persist a feeling of apprehension that these concessions would be retracted as soon as normal times returned." (Scott, *Negro Migration During the War, 1920*).

A number of race riots occurred during the War and the several years following. In 1917 a bitter and destructive riot raged in East Saint Louis, Ill. Other clashes followed in Philadelphia, Chester, and Coatesville, Pa., Washington, D. C., Norfolk, Va., Chicago, Omaha, Neb., Longview, Tex., Tulsa, Okla., and in rural Arkansas.

A most thorough report on one such clash is *The Negro in Chicago* (1922). Following the race riot of July, 1919, in that city, in which 23 Negro and 15 white lives were lost, and 537 were injured, Governor Lowden appointed a commission to inquire into its causes and particularly into the background of racial relations from which such clashes arise. This very careful analysis may be taken as exposing typical conditions. In Chicago, considerable unrest had been occasioned in industry by competition between white and Negro laborers due to the influx of Negroes from the South. The Negro population increased from 44,103 in 1910 to 109,594 in 1920, or 148 per cent. Most of this increase came during 1916-19. This increase developed a housing crisis; the Negroes overran the recognized Negro areas, and when they took houses in adjoining areas, friction ensued. A partisan political struggle had taken advantage of the solid massing of Negro voters, whose con-

trolling influence on an unpopular side was resented. Venality and incompetence of the police, and their manifest unfriendliness to Negroes, were contributing factors.

In the actual clash, perhaps the most important factor was the organized gangs of white hoodlums, who, using this excuse for lawlessness, formed nuclei of attacking mobs. "But for them, it is doubtful if the riot would have gone beyond the first clash." Incitement to riot came with the stoning and drowning of a Negro boy, rumors of arming and atrocities on both sides spread rapidly, precipitating action. The riot continued spasmodically for a week and was subdued only by the effective control of the militia and a heavy rain. It is of record that the active participants were predominantly young, boys and men of fifteen to twenty-two, toughs bent on mischief. It is worthy of note that not one incident reported concerned a sex crime. One immediate result of the riot was the intensification of race consciousness, solidarity, suspicion, and antagonism, which several times in the ensuing year almost precipitated a repetition.

The commission, in making its recommendations, frankly recognizing that the inheritance of prejudice and suspicion of both races is not easily allayed, nevertheless suggested certain action to circumscribe clashes. Among the more important recommendations were a more effective organization of police and militia, greater fairness in arrests and trials, proper housing for Negroes, better schooling and recreational opportunities, a caution to the press in handling inter-race news stories and a request to print material to dispel prejudice, and an appeal to all groups to seek understanding of one another's problems and exercise restraint in action. It is obvious that these recommendations apply equally to all communities.

Negroes in the South still suffer for lack of educational opportunities. The total annual expenditure in the country (about 1924) was as follows: all public schools, \$1,600,000,000, Negro public schools, \$28,000,000 (1.8 per cent), all high schools, \$400,000,000, Negro high schools, \$9,000,000 (2.3 per cent). In the Southern States, the expenditures for Negro children averaged about 11 per cent of the total, although Negroes constitute upward of two-thirds of their population. Their teachers have, in general, preparation to teach only the third grade, are paid but a ninth or less of the salaries of similarly situated white teachers, and hold school but for five months a year.

The excuse for lynchings in the South is a charge of rape or attempted rape, or even a suspected attempt. It is commonly believed, not only in the South but over the country at large, that Negroes are predisposed to sex crimes, and that all lynchings are punishments of this offense. Statistics on the subject are instructive. In the two decades, 1883 to 1903, there were 1985 Negroes lynched in the South; rape was assigned as the cause in 675 cases, a third of the total. In the four-year period, 1914-18, there were 264 lynchings; 28 being on charges of rape, i.e., a ninth. However, of the 1985, 50 were Negro women; of the 264, 5 were women. The Congressional Committee on Immigration found that in New York State, the percentage of cases of rape was less for Negroes (0.5 per cent) than for native-born (0.8 per cent) or foreign-born whites (1.8 per cent). Further, in New York County, which is only a part of

New York City, in 1917 there were 230 indictments for rape, of which not one was a Negro. Nine times as many whites were indicted for this crime in this single county as there were Negroes lynched in the whole country over a four-year period. Such conditions are not peculiar to New York, but general over the country.

A new and characteristic American Negro type appears in process of formation. The first serious general study of his physique in *The American Negro*, by M. T. Herskovits, appeared in 1928. Contrary to the picture given by the 1920 U. S. Census that 80 per cent of Negroes are of wholly Negro ancestry (8,802,577 in 10,463,131), this investigator found in the populations studied: unmixed Negro, 22 per cent; more Negro than white, 32 per cent; equally white and Negro, 17 per cent; more white than Negro, 15 per cent; other mixtures, as with Indians, 15 per cent. This author holds that a new Negro type has developed, characterized by traits intermediate between white-Indians and West African Negroes, although in thickness of lips, they approach the latter. It is more homogeneous than one would expect as the result of this amalgamation, low variability of family lines indicates inbreeding, while high variability within families is witness to the diversity of descent. It appears that the mixture was several generations back, growing racial consciousness making for inbreeding. Selective mating is taking place, dark husbands seeking lighter wives. (See also Hrdlicka, "Anthropology of the American Negro," *Amer Jour Phys Anth*, 1927, p. 205. Davenport and Love, *Medical Department, U. S. Army in the World War*, vol. 15; "Statistics," Part I "Army Anthropology" (1921). An encyclopedia on the Negro is the *Negro Year Book*, 1912 to date.

The Oriental problem in the United States is quite different, since it is based on a much smaller number of individuals, whose social and economic circumstances differ from those of the Negroes. Nevertheless, the problems have in common an increase in numbers of the unassimilated group and its marked localization. Orientals reside almost wholly in the Pacific States, the greater number in California. The following data show the changes in population in the decade 1910-20 (U. S. Census)

	United States		Pacific States	
	1910	1920	1910	1920
Chinese	71,531	61,639	46,320	34,265
Japanese	72,157	111,010	57,703	93,490

That is, there was a manifest increase in the total Japanese population, with a decrease of Chinese. This is also the case for the Pacific division taken separately: other divisions of the country show relative stability over the decade. These statistics also indicate the concentration on the west coast; in 1920 half the Chinese lived in California, Oregon, and Washington, 84 per cent of the Japanese. The Japanese are distributed in these three States roughly in the proportions, 3.1:1.

The Oriental problem had its inception in Chinese participation in the California gold rush and in Western railroad building. In 1882 they were excluded from entry and by 1890 their problem had passed. The exclusion policy was effective. The immigration of Chinese laborers was stemmed and their number in the country has declined. The resident population has scattered throughout the country, so that

anti-Chinese feeling has become almost non-existent. However, the resident Chinese are resentful of the manner in which they have been treated.

Japanese began coming in numbers in 1890. At first greeted with friendliness, opposition soon rose. This was wholly local until 1906, when it attracted national attention. In 1907 Roosevelt negotiated with Japan the so-called Gentleman's Agreement, whereby the latter undertook to issue no passports to laborers. This did not remedy the situation, since wives were still admitted, whereby the group increased by reason of their high birth-rate. A partial remedy was had in 1920 by the voluntary discontinuance of issuing passports to "picture-brides."

Japanese immigration has never been large when contrasted with that of other nations. It dropped from 15,803 in 1908 to 3111 the following year and 2720 in 1910, rose to 8929 in 1914 and 10,213 in 1918, then fell to 5809 in 1923, rose to 8801 in 1924, and was only 723 in 1925 and 654 in 1926. Emigration of Japanese followed a reverse trend, from 3431 departing in 1908, it rose to 4366 in 1910, dropped to 731 in 1913, remaining at that level to 1917, rising again to 1583 in 1918 and 4368 in 1922, whence it dropped again to 1208 in 1926. Emigration exceeded immigration in 1909 by 600 and in 1910 by 1600, while departures numbered more than half the arrivals in 1921 and were double the arrivals in 1925 and 1926.

Yet difficulties increased over this period and agitation against the Japanese continued on the part of the West coast whites. This reached a culmination with the rearsual of a narrow nationalism engendered by the World War. The earlier objections to Chinese had been on the grounds of low standards of living and consequent competition, but the newer objections were based on the desire neither to assimilate nor amalgamate with these people, coupled with a fear of their high fecundity. Nevertheless, economic motivation was indicated by the objections raised to their holding land (R. L. Buell, *The Development of Anti-Japanese Agitation, 1922-23*).

The attitude of the Californians in 1920 was well exemplified in a letter of Governor Stephens covering the transmission of a report by the State Board of Control to the U. S. Secretary of State. He recounted the doubling of the Japanese population in the decade 1910-20; then control of 458,056 acres of the best agricultural land in California (an increase of 412.9 per cent) and of 80-90 per cent of "certain essential food products" (such as tomatoes, spinach, potatoes, asparagus, and berries). The Japanese population tended to concentrate in colonies where they outnumbered the whites and where white children were taught in schools predominantly Japanese. Then fecundity far exceeded that of any other group in the country. The crux of the matter was that by reason of "economic standards impossible to our white ideals" they were "proving crushing competitors to our white rural populations." Further, Californians were determined to repress the formation of these groups because of "the ethnological impossibility of assimilating the Japanese people."

It was to the credit of Californians that no outrages had been perpetrated against the Japanese and that they had restrained their legis-

lation on behalf of international amity. A Federal exclusion and registration act was recommended as the only relief. This document conveniently ignored the increase in departures and decrease of arrivals at the end of the decade, that Japanese constituted only 2.5 per cent of the total population of California and their holdings 4 per cent of all improved farm lands; and that their fecundity, natural in any young immigrant group, would materially decrease, as it has since.

The upshot of this agitation was Congressional investigations on the Pacific coast in 1920-21, the enactment of anti-alien land laws by the coast States (see E. G. Mears, *Resident Orientals on the American Pacific Coast, 1928*), and their exclusion by the Immigration Act of 1924. California adopted an anti-alien land law by overwhelming popular vote in 1920, which was soon followed by similar enactment in Oregon and Washington. These laws were amended in 1923 to prevent alien guardians holding land for their minor citizen children and to prevent cropping contracts. The Immigration Act barred alien wives of citizens, and the parents, wives, and minor children of domiciled alien Japanese. The act had the effect of reducing Japanese immigration to one-twelfth of its former volume. It also produced a change in their composition; proportionately more men than women entered and fewer departed, and these were drawn from older age groups.

"The Immigration Act of 1924 has been in effect too short a time to warrant any prediction as to its ultimate significance. But judging from two and a half year's experience of its operation one might hazard the conjecture that in its practical outcome the act will do for Japanese immigration what the Exclusion Act of 1882 did for Chinese immigration. That is, it will so reduce and select the stream of Japanese immigration that the Japanese problem in this country will cease to be of public concern. Already, there has been a noticeable decline in anti-Japanese sentiment. The Japanese residents of this country will, in all probability, as the years pass, become more widely distributed throughout the Union. Since the 1924 law went into effect, the percentage of Chinese and Japanese immigrants taking up permanent residence in the Pacific Coast States has shown a considerable decline." The Japanese are, however, resentful of this exclusion; they would prefer a policy of restriction as implying no discrimination beyond that accorded other nationals. This would be quite as effective as the present exclusion policy. (R. D. McKenzie, *Oriental Exclusion, 1928*).

Mexican immigration into the United States is increasing. The entries have been irregular; rising from 44,776 in 1919 to 75,988 in 1923, jumping to 105,787 in 1924, dropping to 49,729 in 1925, and rising again to 66,766 in 1927. These are the figures of the Immigration Commission, but undoubtedly many more crossed the border without registration. The total for 1928 was estimated at 70,000. The exclusion of Chinese stimulated the immigration of Japanese and their exclusion has in turn stimulated that of Mexicans. As already pointed out, this was also stimulated by the northward movement of Negroes.

Bibliography. A well-balanced view of these conditions is expressed in J. H. Oldham's *Christianity and the Race Problem* (1924); other

books on the subject are E. G. Murphy, *The Basis of Ascendancy* (1909); and A. M. Carr-Saunders, *The Population Problem* (1922). See EUGENICS; IMMIGRATION; INDIANS.

RACES, ORIGIN OF. See ANTHROPOLOGY.

RACES OF MAN. See ANTHROPOLOGY.

RACHILDE (1862-). The pseudonym of Mme. Alfred Valette, a French novelist who was born (Eymery) at Périgueux. She was an imaginative writer of the unusual. Her works include *A mort* (1886); *L'Heure sexuelle* (1898); *La Tour d'Amour* (1899); *Dessous* (1904); *Le Meneur de Louves* (1905); *Son Printemps* (1912); *La délivrance*, a play (1915); *La découverte de l'Amérique*, short stories (1919); *Dans le puits* (1919); *Jarry* (1928); and *Le Prisonnier* (1928). Consult *Rachilde*, by Ernest Gaubert (1907).

RACHMANINOV, rak-mă'ně-nôf, SERGEI (VASSILIEVITCH) (1873-). A Russian composer and pianist (see VOL. XIX). For almost 10 years, beginning with the Russian Revolution, he abandoned composition, devoting his entire time to concert tours as a pianist in Europe, and especially in the United States, idolized on both continents. Why his creative impulse remained stifled for such a long period, is a matter of conjecture and greatly to be regretted, when all the real talents of the time, R. Strauss, Puccini, Sinding, Sibelius, and Elgar were deteriorating, just when music was in dire need of strong individualities to uphold the standard of true art in the general chaos of modernism. That Rachmaninov's genius would have been equal to the task is proven beyond doubt by the unmistakable individuality, the remarkable inventive power, the expressiveness of the thematic material and its logical, masterly development, the inherent beauty and massive strength manifested in the works up to 1915. Fortunately, these same qualities appear again in the new works which the composer, after his long silence, gave to the world in 1926, *Russische Gesänge*, for chorus and orchestra, and a fourth piano concerto in G minor.

RACIAL MINORITIES TREATIES. The protection of racial, linguistic, and religious minorities constituted one of the most difficult problems dealt with at the Peace Conference of Paris. Throughout the world, there was a tremendous agitation for national self-determination. The peacemakers of 1919-20 endeavored to enshrine the principle of nationality in the political and territorial resettlement of Europe, and to a large extent they succeeded (see PEACE CONFERENCE AND TREATIES); but so intermingled were different nationalities in various parts of the former empires of Russia, Austria-Hungary, and Turkey that it proved virtually impossible to draw frontiers for Poland, Czechoslovakia, Rumania, Serbia, Greece, etc., which would satisfy the legitimate ambitions of their own peoples and yet not outrage their neighbors. Ethnographic considerations had to be weighed, along with economic and strategic necessities and desires. A racio-religious problem like that of the Jews who were suffering persecution even during 1919 in various countries of Europe, particularly Poland, served to complicate the situation. The Jews were indeed promised a national homeland in Palestine, but even there they were in a minority. Meanwhile, what was to become of their kinsmen in Europe? These problems could not be solved by splitting up the world indefinitely. Not every tiny group

could have its own flag and place in the family of nations. The formula of self-determination, carried to an extreme, would have been a *reductio ad absurdum*. On the other hand, the world had been so long and so sorely troubled by such repressive movements as the Anglicization of Ireland, the Russification of Poland, Finland, etc., that it would have been utter folly to hand over dissentient minorities to the tender mercies of nationalist patriots who despite their own thirst for national political independence and national cultural expression would tyrannize over "inferior races." Experience had amply demonstrated that newly emancipated or unified nations were the first to deny emancipation or unification to others.

The Great Powers which dominated the Peace Conference did not intend to have their sovereignty impaired by pledges regarding the equitable treatment of minorities within their own boundaries, but neither were they entirely willing to underwrite a settlement affecting other states in which the oppression of submerged nationalities should constitute too great a menace. They argued that as it was their efforts that had largely won the War, it was their duty and privilege to dictate the peace, and as they were consenting to the resurrection or augmentation of Poland, Rumania, Czechoslovakia, Jugoslavia, etc., and were transferring large numbers of people of different races, languages, and religions from those of the majority, they had the right and were in duty bound to see that states which they were so conspicuously aiding should not be in a position by unjust or tyrannical treatment of such minorities to imperil the peace of the world. During the stormy eighth plenary session on May 31, 1919, President Wilson took the lead in defending the attitude of the Great Powers, much to the dismay and discontent of the smaller powers. Rumania and Jugoslavia hotly resisted the exaction of such pledges as were contemplated and even refused for several months to sign the Treaty of St. Germain, but eventually (December, 1919), they were partly coerced, partly conciliated, into signing. (See PEACE CONFERENCE AND TREATIES.) During 1919 and 1920, the Great Powers negotiated a series of treaties with the Balkan powers and Succession States which elicited pledges to respect and preserve political, religious, cultural, and economic rights of dissentient groups.

In the case of Poland (treaty signed June 28, 1919), special protection was deemed necessary for the Jews, who constituted one-seventh of the population. The new Poland came to include also about 2,000,000 Germans and 3,000,000 Ruthenians, in the province of Galicia, who were to be similarly protected. In the case of Czechoslovakia, there were some 3,000,000 Germans, 750,000 Magyars, and 460,000 Ruthenians, not to mention the religious minorities comprising about 1,000,000 Protestants, 500,000 Greek Catholics, and 350,000 Jews. In the case of Rumania, there were several million Magyars, Germans, Serbs, etc., and a large element of Jews (750,000). In Jugoslavia special provisions were made for the Moslems. In addition, there were incorporated in this new state about 450,000 Germans, 450,000 Magyars, 150,000 Rumanians, and some Bulgarians. Italy, which acquired not only the Italian-speaking population of irredentist Trentino and Trieste but also about 300,000 Austro-Germans in the Tyrol

and a like number of Yugoslavs near the Adriatic, was not obliged to make any pledges. Greece, however, being a small power, was forced to promise special treatment for minorities in Macedonia, Thrace, etc. Clauses protecting minorities were inserted in the treaties with Austria, Bulgaria, Hungary, and Turkey; and subsequently Germany, as a result of the Upper Silesian settlement, was compelled to subscribe to the principal parts of the Polish Minorities Treaty for at least 15 years as regards those parts of Upper Silesia definitely awarded to her.

The minorities treaties were alike in all essentials, differing only from state to state as special provisions were made to meet exceptional circumstances. In general, they removed all restrictions on the use of languages, on the exercise of any religion not injurious to public welfare, and on the press and right of free speech, free assemblage, and free association, etc. All languages were to be given adequate facilities before the courts. All racial, linguistic, and religious minorities were to have the right to establish, manage, and control, at their own expense, charitable, religious, and social institutions and schools. The national government, i.e., the dominant majority in the state, might make instruction in its official language obligatory in all schools, only providing it offered adequate and reasonable facilities for other languages used by the people within its frontiers.

These stipulations were primarily guaranteed by the Great Powers, but they were also declared "objects of international concern over which the League of Nations has jurisdiction." Any member of the Council was empowered to call attention to infractions of a minority treaty, and disputes as to law and fact might in certain instances be referred to the Permanent Court of International Justice for final decision. When it came into existence, the League of Nations assumed control. It was early decided that under ordinary circumstances, when the Secretariat received a petition from a minority, it was to communicate it to the government concerned before passing it on to the Council, in order to allow the government to examine the charges and to state its position. The whole matter was then to be studied by a Council committee, and if action were deemed necessary, the council was authorized to take suitable measures for the observance of treaty obligations. Czechoslovakia very soon won an honorable renown by the readiness with which she gave all necessary information to the League regarding her treatment of minorities and her whole-hearted fulfillment of treaty pledges. But the attitude of Poland and Rumania did not prove to be so coöperative.

In addition to watching over the observance of Minorities Treaties signed at the Peace Conference, the League obtained declarations from various Powers, on their admission into the League, with regard to the protection of minorities. On Sept. 22, 1921, Albania signed a declaration promising besides other things to provide "an electoral system giving due consideration to the rights of racial, religious, and linguistic minorities," to give full detailed information, and to "take into account any advice it might receive from the League of Nations with regard to the question." Similar declarations were obtained in 1921 from Lithuania and in 1922 from Estonia and Latvia. In the case of Finland, the Council resolved (Oct. 2, 1921)

that under existing internal laws, minorities were protected, and a declaration was needless. The Great Powers made no pledges regarding themselves, but the third assembly of the League (1922) formally "expressed the hope that states not bound to the League by any legal obligation, such as that contained in the Minorities Treaties, would nevertheless observe in their relations with racial, religious, or linguistic minorities, at least the same degree of justice and tolerance as is required by the treaties watched over by the Council." See LEAGUE OF NATIONS.

RACING. Thoroughbred racing, the "sport of kings," with an origin traceable to the ancient Greek and Roman chariot races, rates as a preeminent sport in Great Britain, France, the United States, Canada, Cuba, and Mexico. The historic English Derby, the French Grand Prix, and the Kentucky Derby continue year after year to attract their thousands to the courses where they are contested, while countless other thousands of turf followers now listen in to the detailed radio descriptions afforded of these racing classics. At various intervals, agitation against the "betting evil," correlative to racing, has culminated in legislation directed toward curbing, if not obliterating, betting, but the usual wagering continues in some form or other. The Calcutta Sweepstakes, as the "pool" on the English Derby is known, yields more than a \$1,000,000 annually. This famous English stake was first competed for in 1780, the purse of 50 sovereigns being offered by the twelfth Earl of Derby for three-year old colts. Diomed, owned by Sir C. Bunbury, proved the first winner. In connection with the running of the English Derby, it is interesting to note that Steve Donoghue, as jockey, has scored six victories in this fixture, beginning with the year 1915. The record for the Derby, as fixed in 1921 (about 1 1-4 miles), was set by Call Boy in 1927 and equalled by Fellestead in 1928, the time being 2 minutes, 34 2-5 seconds.

The Grand Prix, run at the Longchamps course, near Paris, had its inception in 1863 and the Kentucky Derby, run at Churchill Downs, Louisville, Ky., began in 1875. The best time accomplished in the Kentucky Derby was that of Old Rosebud, carrying 114 pounds in 1914, 2 minutes, 3 2-5 seconds. With the weight set at 126 pounds, Bubbling Over turned in the fastest time, 2 minutes, 3 4-5 seconds, in 1926.

RADBURN, N. J. See CITY AND REGIONAL PLANNING.

RADCLIFFE COLLEGE. A college for women at Cambridge, Mass., founded in 1879. Instruction is given by members of the Harvard University faculty. Most of the courses of study are identical with courses of study offered in Harvard and all of the courses are of the same grade as those given in Harvard. The enrollment increased from 628 in 1914 to 1109 in 1928 including 323 graduate students. The faculty was increased during the same period from 136 to 215 members and the library from 32,000 to 65,000 volumes. Due largely to an endowment campaign held in 1921, the productive endowment of the college was increased from approximately \$1,000,000 in 1914 to \$4,815,286 in 1928. Briggs Hall, a dormitory, was completed in 1925. President, Ada Louise Comstock, LL.D., Litt.D., L.H.D.

RADEK, ri'dëk, KARL BERNGARDOVICH (1885-). A Russian Communist leader and pub-

licist, born in Lemberg. He joined the Polish Social Democratic Party in 1904, was on the staffs of Polish and German radical papers (1906-13), and distributed Communist and anti-war propaganda from Switzerland and Stockholm during the World War. A devoted lieutenant of Lenin, he was one of the Soviet negotiators of the Brest-Litovsk Treaty. He then served successively as director of the central European section of the People's Commissariat for Foreign Affairs, secretary of the Communist International (1920-23), principal of the Communist University for Workers of the Orient (1926-27), and principal of Sun Yat-sen University in China. Joining the Trotsky opposition to the Stalin régime, he was exiled to Tobolsk in January, 1928. His writings, some of them under the name of Arnold Struthahn, include *Die Entwicklung des Socialismus von der Wissenschaft zur Tat* (1919); *In den Reihen der deutschen Revolution* (1909-19); *Gesammelte Aufsätze und Abhandlungen* (1921); *Wege der russischen Revolution* (1922); *Nach Genua und Haag* (1922); *Lenin, sein Leben, sein Werk* (1924).

RADIATION. See ASTRONOMY.

RADIĆ, STEFAN (1871-1928). A Yugoslavian political leader. In the nineties, he was imprisoned several times for his opposition to the Hungarian government. He strove for Croatian autonomy, and in 1904 founded the Peasant Party and wrote *The Croatian Thought* (1903-04) in the hope of enlisting the intellectuals in this movement. During the World War, his party was pacifist. Between 1919 and 1925, Radić spent most of his time either in prison or traveling in Europe, but in March of the latter year the party recognized both the Serbian dynasty and the Constitution, having heretofore refused to participate in the government. In November, 1925, he became Minister of Education, and although he remained in office only until April, 1926, he controlled the cabinet until February of the following year. He stood strongly for decentralization of power and the lessening of the Serbian influence in it, and after his election to the Skupština in September, 1927, he practically prevented legislation, due to his opposition to measures of Serbian origin. On June 20, 1928, he was shot in the Skupština by a Radical Serbian member, and died from the wounds on August 8. See JUGOSLAVIA, under *History*.

RADIO COMMUNICATION. See BROADCASTING; PHYSICS; RADIO-TELEPHONY.

RADIO COMPASS. The well-known directive characteristic of an antenna made in the form of a flat loop was used in the Bellini-Tosi radio compass which had some application in marine navigation. Two one-turn loops were arranged on the ship's rigging, the turns being at right angles to each other. They terminated in the radio room, in two coils at right angles, inside of which there was a third rotatable coil; this coil served as the input circuit for the radio receiver. As it was rotated the strength of received signal increased and decreased, being zero twice and maximum twice for each revolution. When suitably corrected, it served to show the direction from which a signal was being received, and hence to locate the ship, in direction, with respect to the transmitting station. By picking up signals from two shore stations, the positions of which are marked on his chart, the navigator was able to determine his ship's position. The simple rotatable loop antenna, about three feet square, is now

used more extensively than the Bellini-Tosi arrangement. The loop is mounted above the radio room on shipboard and its position is adjustable by the operator. After its corrections have been applied (different, of course, for each ship), its indications may be relied upon to within a degree or less.

Refraction of radio waves by sunset conditions, shore lines, etc., of course directly affect the accuracy of the radio-compass bearing. This can only indicate the direction of the waves, as they pass the loop antenna; if they have been bent by obstruction or atmospheric conditions, the apparent bearing of the station is wrong to the same extent. The radio compass has proved of inestimable value in several sea disasters; in the rescue of the steamship *Florida* by the *America* in 1928, the latter ship was able to find the *Florida* by radio-compass bearing even when the *Florida* did not know her own position.

RADIO INSTRUCTION. See EDUCATION IN THE UNITED STATES.

RADIO TELEGRAPHY. At the present time, the spark telegraphy apparatus of the early radio sets has been largely supplanted by continuous-wave transmitters and receivers. In the merchant marine, there are still some spark sets, using either *synchronous* or *quenched* spark gaps. This type of set generally uses a 500-cycle alternator sparking twice per cycle, thus giving the received signal a musical note of 1000 vibrations per second. Glass condensers (Leyden jars) or mica condensers are used for storing the energy, which is transformed into high-frequency oscillations. A capacity of about .01 microfarad is used per kilowatt rating of the set. A well-constructed and installed spark set gives a signal with a decrement as low as 0.1, which permits reasonably sharp tuning.

In the better class of merchant marine, and in naval vessels, interrupted continuous wave (I. C. W.) has been much used. In this scheme, a three-electrode vacuum tube (triode) is arranged in a regenerative circuit, to produce continuous oscillations which are supplied to the antenna. In the plate circuit of the triode, the 500-cycle alternator (from the old spark set) is used for power supply. As the triode will generate oscillations only when its plate is positive, this scheme puts into the antenna groups of oscillations, one group for each positive alternation of the alternator. Such a transmitting set gives a signal which is received as a pure 500-cycle musical note. The tuning of such a signal, in the receiving set, is much sharper than is the spark signal and so produces less interference.

In all of the transoceanic radio-telegraph channels today, continuous-wave transmission is used. The frequencies used are generally between 20 and 30 kilocycles per second and the power used is ordinarily about 200 kilowatts. Some idea of the size and power of these low-frequency long-distance transmitters can be gained from the accompanying table, which gives data from typical stations.

Station and Call Letters	Frequency in KC	Antenna current in amperes	Effective height in meters
Nauen POZ	23.4	390	145
Bolinas KET	22.9	420	51
Monte Grande LPZ	23.6	610	150

MODERN RADIO APPARATUS

These stations all are outside of the United States. The high-powered low-frequency stations in the United States are operated either by the U. S. Navy or by the Radio Corporation of America. The latter company has its transmitting station at Rocky Point near New York City, where several antennae and sets of transmitting apparatus carry on telegraphic communications with stations in practically every country of Europe, as well as South America.

The high-frequency power for these continuous-wave stations is obtained from (1) the oscillating arc, (2) saturated iron-core frequency doublers, (3) inductor alternators, or (4) oscillating triodes. The stations of the U. S. Navy use the arc, those of the Radio Corporation use an inductor alternator designed by Fessenden and improved by Alexanderson. German stations use iron-core frequency doublers or the "reflection" alternator of Goldschmidt, and the French stations use either arcs or inductor alternators of French design and manufacture. In the European stations owned by the Radio Corporation, so-called Alexanderson alternators, of 200-kw. rating, are used.

It seems possible that all of these methods of generating power may be superseded by high-powered triodes arranged in regenerative circuits. Using glass or quartz bulbs, the triode had an upper capacity limit of about 1 kw. but with Housekeeper's development of the large copper-glass seal, it became possible to utilize the copper wall of the triode as plate. This permitted water cooling of the plate and at once made possible triodes of 100- or even 1000-kw. capacity. The present standard sizes of these water-cooled triodes are either 5 or 20 kw.

These large triodes are generally arranged as amplifiers, getting their grid excitation from smaller triodes which themselves are excited from smaller ones. The small self-excited triode, which actually serves to fix the frequency of the station, has its frequency set by a small piece of piezo-electric quartz. There are three types of filaments used in the modern triode, pure tungsten, thoriated tungsten, and oxide-coated filaments. For tubes of high power and high voltage, pure tungsten filaments are generally used as it is possible to "outgas" them much more thoroughly than the other types. For low-powered tubes, both diodes (two-element vacuum tubes or rectifiers) and triodes, either thoriated filaments or oxide-coated filaments are used. These are superior to pure tungsten with respect to the electron emission per watt of power. The oxide-coated filament gives about .03 ampere emission per watt of filament power, the thoriated tungsten about .02 ampere per watt, and the pure tungsten about .003 ampere per watt.

The modern vacuum tube is evacuated by pump (sometimes of the mercury-vapor ejector type) to about 10^{-4} - 10^{-5} mm. of mercury, the pumping being continued while all parts of the tube are heated. The tube is then sealed off from the pump and a small piece of volatile metal (such as magnesium) is evaporated, inside the bulb, and condenses on the walls. This freshly condensed metal acts as a sponge on the residual gases, increasing the vacuum to about 10^{-6} mm. of mercury. This procedure is called the "clean up" and the material is called the "getter."

In recent years, short waves, lower than 100 meters, have been found suitable for transmission over tremendous distances. It seems that there is a layer of partially ionized air, about 120 miles

above the earth's surface, which serves to reflect these short waves, and so carry them around the earth.

A 5-kw. station sending out a 40-meter wave, gives a signal decreasing with distance from the station which would become inaudible at about 80 miles. This would be the limit of the so-called ground wave. Then for hundreds of miles no signal would be heard; at about 2000 miles distance, on a winter night, the signal would be again picked up and would be heard with readable intensity up to about 10,000 miles. The silent zone, between 80 and 2000 miles, is called the *skip distance* of the station.

When using short waves, it is possible to use a collection of antennae at both transmitter and receiver, to act as mirrors. At the transmitter, the array of antennae serve to concentrate most of the station's energy in a comparatively narrow beam, perhaps 30 degrees wide; this directive action of the transmitter increases the amount of power available at the receiver. The receiving antenna is placed at the focus of a set of antennae acting like a parabolic mirror, and thus receives much more power than would a simple antenna. A few kilowatts of short-wave power, with directive antennae, serve to give quite reliable telegraphic communication half around the world.

The receiving set for telegraphy consists of a set of radio-frequency amplifying triodes, a detector, and some audio frequency amplifiers. For continuous-wave reception, an oscillating receiving triode is necessary to produce a *beat frequency* of audible pitch, between the signal and locally generated H. F. current. This *heterodyne* method of reception (due to Fessenden) is much more sensitive than if a spark-wave or I. C. W. signal is being received, with a non-oscillating triode. It is the superiority as regards sensitiveness, as well as selectivity, which accounts for the almost universal use of continuous-wave telegraphy today.

For the long-wave telegraph receiving stations, a special form of antenna is used, called the *wave antenna*. It consists of a wire, several miles long, supported a few feet high and pointed in the direction of the desired signal. The end nearer the transmitting station is grounded through a resistance equal to the *surge resistance* of the line and the receiving set is connected between the other end and the ground. By using several different tuned receivers, it is possible to get six or more messages at the same time from one antenna. Such an antenna has a high ratio of signal-to-static, so that it is reasonably free from atmospheric and other disturbances.

At present, practically all the radio telegraphic traffic of the United States is handled and controlled by the Radio Corporation of America. This is really a patent-holding concern, which, with government sanction, has obtained practically a monopoly on all important radio patents. The formation of such a combine was thought wise by government officials, so that radio development might progress in the United States without continual interference from patent litigation. It is practically impossible today for a company to carry on any radio traffic, unless licensed to do so by the Radio Corporation. From its licensees alone, this company has an annual income of several million dollars.

Piezo-electric Oscillator. Rochelle salt and quartz are quite active piezo-electrically; if compressed, electric charges collect on their surfaces and if a charge is put on their surfaces they change shape. This action of quartz is now

used almost universally to control the frequency of an oscillating triode. A small piece of quartz, about as big as a dime, properly cut from a quartz crystal, is loosely held between two small insulated metallic plates, one of which is connected to the filament of a triode and the other to the grid. The plate circuit contains a tunable circuit (coil and variable condenser in parallel) and when the frequency of this circuit is about the same as the natural vibratory frequency of the quartz, the triode circuit will oscillate *at the natural mechanical frequency of the quartz*. For the piece of quartz mentioned, this frequency is about 300 kilocycles. Such piezo-electric oscillators are employed to excite larger tubes and these excite others until, finally, an electrical output of perhaps 100 kilowatts is being accurately controlled as to frequency, by a dime-sized bit of quartz.

The characteristics of quartz are very permanent, and but little affected by temperature, so that a properly constructed piezo-electric oscillator, suitably controlled for temperature, may be depended upon as a frequency standard to a few thousandths of 1 per cent. Such an oscillator has been transported from country to country, for international comparison of frequency standards.

RADIO TELEPHONY. By modulating the amplitude of the wave of a continuous-wave transmitter with the voice, radio telephony is possible. The engineers of the American Telephone & Telegraph Co. were the first to accomplish radio telephony over appreciable distances; in 1915 they used the United States government antenna at Arlington, Va., excited it by a battery of several hundred triodes, and succeeded in "talking" as far as Paris, to the east, and San Francisco and Honolulu, to the west. Since then, radio telephony has gone forward until today any telephone subscriber in America can talk directly to nearly anyone of the subscribers in Europe.

The first really commercial use of the radio telephone was for the purpose of enabling the subscribers of Catalina Island, off the California coast, to talk with those on the mainland. This commercial link was later discontinued, as it was found possible to use a cable instead, and of course this gave greater secrecy.

Starting experimentally in 1923, a radio telephone channel was developed between the United States and England. The 200-kw. output of the transmitter is controlled by a few microwatts of power from the microphone of a subscriber perhaps several thousand miles away. By eliminating the "carrier" wave and transmitting only one "side band," the 200-kw. output is made several times as effective as it would otherwise be. By using a directive receiving antenna and locating this at a place where atmospheric and other disturbances are exceptionally low, it is estimated that the effectiveness of the 200-kw. input to the transmitting antenna is increased 30,000 times over what it would be if none of these special features were used. That is, the received signal is as distinct as it would be from a 6,000,000-kw. transmitting station, sending out carrier and both side bands, using non-directive receiving antenna, in a place with normal atmospheric disturbance, etc. With the development of special cables, which promise telephony across the Atlantic, it seems questionable if transoceanic radio telephony will be greatly extended. The main application of the radio telephone will evidently be in the field of radio broadcasting. See BROADCASTING.

RADITCH, STEPHEN. See RADIC, STEFAN.

RADIUM AND RADIUM MINERALS.

Radium is a metal with a white metallic lustre. It has been isolated only once or twice, and few persons have seen it. It is ordinarily obtained from its ores in the form of sulphate, chloride, or bromide, and is usually sold and used in the form of these salts. All these are white or nearly white substances. Radium, radium salts, and radium minerals generally are not luminescent. Tubes containing radium salts glow mostly because they include impurities which the radiations from the radium cause to give light. Radium is found in nature in such exceedingly small quantities that it is never visible even when the material is examined with a microscope. Radium ore ordinarily carries only a small fraction of a grain of radium to the ton; radium will never be found in large masses, because it is formed by the decay of uranium, a process that is wonderfully slow; and radium itself decays and changes to other elements so rapidly that it does not accumulate naturally in visible masses.

Original radium minerals, such as uraninite, samarskite, and brannerite, are black and have a shiny fracture and a high specific gravity. They are rarely found in commercially valuable quantities. Pitchblende, which has the same composition as uraninite and the same general appearance except that it shows no crystal form, occurs in veins. It has been found in a few places only—in Bohemia, southern Saxony, Cornwall, Belgian Congo, and Gilpin County, Colorado. When these minerals break down through weathering, other radium minerals are formed from them, such as autunite, torbernite, carnotite, and tyuyamunite.

Carnotite and tyuyamunite are the most abundant of these minerals, though the bulk of the world's radium production comes from the pitchblende ores of the Belgian Congo. Both carnotite and tyuyamunite are bright yellow in color and are powdery, finely crystalline, or, rarely, claylike in texture. Carnotite is a hydrous potassium-uranium vanadate. Tyuyamunite is similar in composition but contains lime instead of potash. The greatest known deposits of these two minerals are in southwestern Colorado and southeastern Utah, where both are associated with fossil wood and other vegetation in friable, porous, fine-grained sandstone. Small quantities of carnotite have been produced near Olary, South Australia. The only other deposits that yield tyuyamunite in notable quantity are those of Tyuya-Muyun, in the Andijan district, Fergana government, central Asiatic Russia (Russian Turkestan), where tyuyamunite occurs with rich copper ores in a pipe in limestone (see below).

Radium Industry. An important radium industry was started in the United States during the World War, utilizing the carnotite deposits in Utah. This, however, was rather short-lived, as by 1922 the cheap production of radium from the rich altered pitchblende deposits near Elizabethville in the Belgian Congo controlled by the Union Minière du Haut Katanga Company, rendered it impossible to work at a profit the carnotite deposits of Colorado and Utah. As a result of this changed condition, capital amounting to several million dollars invested in mines, plants for the isolation of radium, vanadium, and uranium, and for the manufacture of apparatus for the handling of radium was rendered nonproductive.

The United States Radium Company in 1923 made an effort to isolate radium in the United States, but only on a small scale; while the Standard Chemical Company operated on an experimental basis its mill in Colorado for the concentration of the vanadium-bearing sandstone associated with the carnotite deposits.

The price of radium had been \$120,000 a gram, but in 1922 it had fallen to \$70,000 per gram. American companies, after closing down their own mines, undertook to market the African product and up to 1924 that material ruled the market. The Katanga ore was shipped to Oolen, about 40 miles from Antwerp, Belgium, where it was treated at the plant of the subsidiary company. This single plant was said to have a capacity of 3 grams of radium (element) per month, which was about the total capacity of all the plants that once operated in the United States.

Reports of productive activity in the mining of radioactive ores come sporadically from Russia, Czechoslovakia, Portugal, Madagascar, and Cornwall. Record of the isolation of radium from these ores is lacking, however, and it appears that their utilization is largely in the manufacture of apparatus for making radioactive drinking water, radioactive pads, and salves, besides luminescent watch and clock dials and house numbers.

Radium from Belgian Congo ores continues to dominate the world market. The Union Minière du Haut Katanga releases no information as to the amount of its radium production, but it does publish in its annual company report the amount of radium sold each year. Information from this source indicates that sales of radium produced from the Katanga ores in recent years have averaged slightly more than 20 grams annually. The retail price appears to be well maintained at around \$70,000 per gram.

RAILWAYS. As in the history of a country there is some one personality or fact which gives the keynote to an understanding of the various events which take place, thus we speak of the Elizabethan period in English history, so with the railways, the situation in 1929 and the years immediately preceding it are best understood in the light of the Transportation Act. This act was passed in 1920. It is entitled "An Act to Provide for the Termination of Federal Control of Railroads and Systems of Transportation To Provide for the Settlement of Disputes Between Carriers and their Employees; To further Amend an Act entitled 'An Act to Regulate Commerce approved Feb. 4, 1887, as amended and for Other Purposes.'" The act is often spoken of as the Esh-Cummings Bill, being the result of a bill introduced in the United States House of Representatives by Representative Esh and another introduced into the United States Senate by Senator Cummings of Iowa. The provisions for the termination of Federal control are mainly of historical importance, although to a certain extent the workings of these provisions give a more or less permanent trend to the course of railway history.

The Transportation Act provided that the Interstate Commerce Commission should make such rates as would yield the carriers as a whole in a given section of the country a fair rate of return. The commission also was given the power and authority to put a value on the railroads' properties and all that was earned by any certain company above 6 per cent on the commission's

valuation of its property was to be divided into two equal parts. One of these parts was to go to the Government, the so-called recapture of excess earnings. Many railroad companies were subject to recapture of earnings under the commission's method of valuation which was to use 1914 prices as a basis for arriving at valuation. The railways contended that present prices, not 1914 prices, should be used as a basis of valuation, and as explained more fully below, the St. Louis & O'Fallon case was used as a test and was decided in 1929 by the Supreme Court of the United States. The majority opinion of the Supreme Court held that the Interstate Commerce Commission had not given due weight to present prices and had exceeded its authority by using 1914 prices. The effect of the O'Fallon decision was to make railroad earnings not subject to recapture by the Government in most cases. This interpretation of the Transportation Act by the Supreme Court tended to restore the credit of the railroads. In effect, the courts in the O'Fallon case gave the railroad companies the same right to the ownership in unearned increment in values that the common law gives to other owners of property.

After the United States entered the World War, it was found necessary for the Government to operate the steam railways of the country as a single system. On Dec. 26, 1917, President Wilson issued a proclamation fixing Jan. 1, 1918, as the date on which the executive branch of the United States government should take charge of the operation of the principal roads of the Union. William G. McAdoo, Secretary of the Treasury, was appointed Director General of Railroads, and on January 1, took over the properties. On Jan. 28, 1918, Congress passed a law embodying the terms under which the Government operated the railway properties. The operation of the railways by the Government has been criticized adversely by railway men, and to a certain extent, by the public in general. It is fair, therefore, to record in connection with government operation, that the railway executives themselves had an opportunity to show what they could do in coöperation in operating the larger railway companies of the country as a whole. They failed to give satisfactory operation and to perform the transportation service to the country during an emergency in a satisfactory manner. They claim that their failure was in large part due to contradictory priority orders of the Government. There is unquestionably some reality in this excuse.

The intolerable situation was created in which a trainload of munitions having a priority order, a trainload of food also having a priority order, and a trainload of troops provided, of course, with their priority order, had to be moved over a busy stretch of railway which could accommodate only one of these trainloads at a time. Furthermore, there was the alternative of government operation if unified private operation proved unsatisfactory, whereas, after the Government had been tried, there was no other untried alternative left, and when it was found unsatisfactory there was a saving determination to grin and bear it, which was not in the public mind during the experiment of private coöperative operation. As a matter of history, the final effort to avert government operation may be recorded. Five railway men, Fairfax Harrison, president of the Southern Railway, Samuel Rea,

president of the Pennsylvania Railroad, Julius Krusschnitt, chairman of the executive committee of the Southern Pacific, Hale Holden, president of the Chicago, Burlington & Quincy Railroad, and Howard Elliott, formerly president of the New York, New Haven & Hartford Railroad, were appointed by the Association of Railway Executives to operate the railways of the country as a whole. The meeting at which this committee was appointed was held in Washington, Apr. 11, 1917, when the executives pledged themselves to follow the orders of the committee regardless of competitive conditions. Most of the executives called meetings of their boards of directors, and had their action in thus delegating their authority to a committee confirmed by the Board.

Transportation Act. The Transportation Act provided that the railway properties should be turned back for operation to the corporations which owned them as of Mar. 1, 1920. It provided that government-owned boats and all other transportation facilities on the inland canal and coastwise waterways acquired by the United States under the Federal Control Act, except transportation facilities constituting parts of railways or transportation systems over which Federal control was assumed, were transferred to the Secretary of War, so that lines of inland water transportation established by the President during Federal control should be continued in operation by the Secretary of War and contracts made during Federal control, as well as appropriations, were to be made by the Secretary of State. The Transportation Act mentions specifically transportation facilities, owned by the United States and included within any contract made by it for operation on the Mississippi River above St. Louis, to be operated by the Secretary of War.

Such facilities, however, were made subject to the provisions of the Interstate Commerce Act "in the same manner and to the same extent as if such transportation facilities were privately owned and operated and employed solely as merchant vessels shall be subject to all other laws regardless of liabilities governing merchant vessels whether the United States is interested therein as owner in whole or in part, or holds any mortgage, lien, or interest therein." Beside appropriations already made, \$200,000,000 was appropriated to be used in the winding up of Federal control. It was found necessary to make a separate contract between the Government and each one of the railroad companies. An attempt was made to standardize this contract on the basis of the annual rental equal to the average annual net operating income for the three years ended June 30, 1917. The majority of the railroad companies signed this standard contract, but others refused to sign it and were operated during the entire period of government operation with the basis of their rental undetermined.

The Government's Railroad Organization. The director general formed a staff which included an assistant director general and divisions of law, finances and purchases, operation, traffic, capital expenditures, labor, public service and accounting, and an actuary to the railroad administration. The country was divided at first into three regions—eastern, northwestern, and southwestern. A. H. Smith, president of the New York Central, was made director of the eastern region; R. H. Ashton, president of

the Chicago & North Western, was made director of the northwestern region; and C. H. Markham, president of the Illinois Central, was made director of the southwestern region.

It was soon found necessary to expand this organization, and the country was divided into seven regions. The eastern region included the territory bounded on the north by Canada, on the west by Lake Michigan and the Indiana-Illinois State line, and on the south, roughly, by the Pennsylvania Railroad line, from Philadelphia to Chicago. The Allegheny region took in the Pennsylvania Railroad as far west as Pittsburgh, the Baltimore & Ohio line, as far west as Pittsburgh, and the other lines in that territory, which included New Jersey, the greater part of Pennsylvania, Delaware, Maryland, and the northern part of West Virginia. The Pocahontas region included the principal bituminous-coal roads, the Norfolk & Western, Chesapeake & Ohio, and other roads in Virginia, the larger part of West Virginia, and part of Kentucky. The southern region included all of the Southeastern States from the North Carolina-Virginia State lines south to the gulf, and west to the Mississippi.

The northwestern region included the territory bounded on the north by Canada, and on the east by Lake Michigan, and on the south by a line running irregularly from Chicago to the southern boundary of Oregon, and on the west by the Pacific. The central-western region was bounded on the north by this southern line of the northwestern region, on the east by the Illinois-Indiana State line, on the south by a line zigzagging southwest from Cairo, Ill., to the southern boundary of New Mexico, and on the west by the Pacific. The southwestern region was bounded on the north by this southern boundary of the central-western region, on the east by the Mississippi, and on the south and west by the Gulf of Mexico, and Mexico.

In his instructions to regional directors, Director General McAdoo said, "Broadly speaking, I wish to give you power to direct railroad operations in your territory so as to handle traffic with the least congestion, the highest efficiency, and the greatest expedition. . . I have put upon you responsibility for the entire operating situation." Notwithstanding this responsibility, however, the regional directors were not given the authority to appoint officers actually in charge of the operation of the railroads in their territory. The director general appointed "Federal managers" and "general managers." Each was in charge of a particular railroad. The difference in titles is a difference in the size of the road managed, and presumably in the salary. Thus, a Federal manager was appointed for the New York, New Haven & Hartford, while a general manager was appointed for the Central Vermont.

In making his appointments, both for the central administration and the regional administrations, the director general selected railroad men of long experience and marked ability. Thus, Carl Gray, of the division of operation, was chairman and president of the Western Maryland, and formerly had been president of the Great Northern. Edward Chambers, director of the division of traffic, was vice president of the Atchinson, Topeka & Santa Fe, and Robert S. Lovett, director of the division of capital expenditures, was chairman of the executive committee of the Union Pacific. One of the ablest

of railroad lawyers, Walker D. Hines, chairman of the board of the Atchinson, Topeka & Santa Fe, was appointed assistant director general. As regional directors, there were A. H. Smith, president of the New York Central, C. H. Markham, president of the Illinois Central, Hale Holden, president of the Chicago, Burlington & Quincy, and B. F. Bush, president of the Missouri Pacific, and other lines.

In the appointment of Federal and general managers, in general, the chief operating officer of the road under the old corporate management was appointed under the government organization. In cases where the president of the road was its chief operating officer, rather than the controlling interest in the management of the company, he was appointed Federal manager. Thus, E. J. Pearson, president of the New York, New Haven & Hartford, was made Federal manager of the road.

On the other hand, in instances where the president of the company was an executive, rather than an operating officer employed by the board of directors, he did not enter the government service, but remained as an officer of the corporation. Thus, Samuel Rea, president of the Pennsylvania, did not become Federal manager of the Pennsylvania, but remained an officer of the corporation, and Elisha Lee, who had been general manager of the Pennsylvania lines east of Pittsburgh, was appointed Federal manager. The line of cleavage between the men who remained corporate officers and those who were appointed Federal managers might form the basis of immensely interesting study, not only in railroad development, but in the economic development of a great American industry.

Mr McAdoo fixed the salary of regional directors and Federal and general managers high enough to command the services of the long-experienced, successful, and able railroad officers. On the other hand, he did not take into his organization men to whom a salary, even of \$50,000 a year, was not of paramount importance, and, it may be mentioned, men whose services could not be measured by a salary, however great, have had an important part in the development of American railways. The value of an E. P. Ripley to the Atchinson, Topeka & Santa Fe, of an L. F. Loree to the Delaware & Hudson, or a Samuel Rea to the Pennsylvania is something that cannot be purchased for so much a year.

The regional directors were given authority to operate the roads in their territory, subject only to general orders from the central administration. The actual responsibility of operating the roads, however, fell on the Federal and general managers. Furthermore, general orders included orders dealing with wages and working conditions. Thus, the authority of the Federal manager was in part taken away by the regional director, and in part undermined by the central administration in its dealings direct with labor. In the opinion of probably the majority of railroad officers, high and low, this separation of authority from responsibility proved a great weakness in the railway organization.

In addition to providing for the payment of compensation (rental) for the period of government operation to railways with whom a specific contract was made, the Transportation Act also provided for compensation for rental of railways with which no specific contract had been made by the Government. Very briefly

summarized, the Transportation Act, in addition to providing for the return of the railway properties to the private corporations for operation, provides:

Section 208 (a) All rates, fares, and charges, and all classifications, regulations, and practices, in anywise changing, affecting, or determining, any part of the aggregate of rates, fares, or charges, or the value of the service rendered, which on February 29, 1920, are in effect on the lines of carriers subject to the Interstate Commerce Act, shall continue in force and effect until thereafter changed by State or Federal Authority, respectively, or pursuant to authority of law, but prior to September 1, 1920, no such rate, fare, or charge shall be reduced, and no such classification, regulation, or practice shall be changed in such manner as to reduce any such rate, fare, or charge, unless such reduction or change is approved by the Commission. [Interstate Commerce Commission]

(b) All divisions of joint rates, fares, or charges, which on February 29, 1920, are in effect between the lines of carriers subject to the Interstate Commerce Act, shall continue in force and effect until thereafter changed by mutual agreement between the interested carriers or by State or Federal authorities, respectively.

There are two terms often used in a discussion of the government operation of railways which should be defined, and are defined in the Transportation Act. One is the guaranty period and means the six months beginning Mar 1, 1920. During this period, under which the railway properties were operated by the privately owned corporations, the Government guaranteed net equal to the net under the operation by the Government. Thus, if the annual rental of a given railway, that is, the sum which the corporation received for the use of its property, was \$5,000,000, and which it could use for the payment of interest on its bonds and dividends on its stock, was not fully earned during the private operation in the six months from Mar. 1, 1920, to Sept. 1, 1920, the Government made up the difference.

The rental was the average annual net earned under private operation for the "test period," or the three years ended June 30, 1917.

Besides the Transportation Act, there was passed in February, 1920, an amendment to the Interstate Commerce Act, originally passed in February, 1887. The provisions of this amendment and of the original act were applied to common carriers and the term "common carrier" was defined as including all pipe-line companies, telegraph, telephone, and cable companies operated by wire or wireless, express companies, sleeping-car companies, and all persons, natural or artificial, engaged in such transportation or transmission as aforesaid as common carriers for hire.

Most important are certain provisions in the amendment to the Interstate Commerce Act. This amendment provides that a railway may not abandon any part of its line or the operation thereof until permission has been obtained from the Interstate Commerce Commission which may issue a "certificate that the present or future public convenience and necessity permit of such abandonment." In like manner, the Interstate Commerce Commission's approval of new construction or extension of a line must be obtained before new construction or extension may be undertaken. The permission for building a new line or an extension is called a certificate of convenience and necessity, which certificate is granted or withheld by the Interstate Commerce Commission, after an investigation which may be conducted by an examiner appointed by the commission as to the proposed new construction or extension.

The Interstate Commerce Commission, by the amendment of 1920, is given jurisdiction over the divisions of a through rate, thus establishing a new principle in the regulation of railway rates. Thus, if a freight rate between Boston, Mass., and Atlanta, Ga., is participated in by the New York, New Haven & Hartford, the Pennsylvania Railroad, and the Southern Railway, not only does the Interstate Commerce Commission have the power to fix the through rate but also to decide what proportion of the through rate shall go to each. The importance of giving the commission jurisdiction over the division of the through rate is great, because it apparently establishes the commission's jurisdiction over what was considered, prior to 1920, as a matter of private bargain, in which the shipper's interest was not affected. Thus, there is implied, at least, a responsibility on the part of the commission for the welfare of individual railway companies, as distinguished from the public's interest as shipper or traveler.

A very important section of the Transportation Act may well be quoted placing the burden of reasonable rates as a whole on the commission. In the amendment to the Act to Regulate Commerce, passed in February, 1920, Section 15A (2) provides:

In the exercise of its power to prescribe just and reasonable rates, the Commission shall initiate, modify, establish or adjust such rates so that carriers as a whole (or as a whole in each of such rate groups or territories as the Commission may from time to time designate) will, under honest, efficient and economical management and reasonable expenditures for maintenance of way, structures and equipment, earn an aggregate annual net railway operating income equal, as nearly as may be, to a fair return upon the aggregate value of the railway property of such carriers held for and used in the service of transportation. *Provided*, That the Commission shall have reasonable latitude to modify or adjust any particular rate which it may find to be unjust or unreasonable, and to prescribe different rates for different sections of the country.

(3) The Commission shall from time to time determine and make public what percentage of such aggregate property value constitutes a fair return thereon, and such percentage shall be uniform for all rate groups or territories which may be designated by the Commission. In making such determination it shall give due consideration, among other things, to the transportation needs of the country and the necessity (under honest, efficient and economical management of existing transportation facilities) of enlarging such facilities in order to provide the people of the United States with adequate transportation. *Provided*, That during the two years beginning March 1, 1920, the Commission shall take as such fair return a sum equal to 5½ per centum of such aggregate value, but may, in its discretion, add thereto a sum not exceeding one-half of one per centum of such aggregate value to make provision in whole or in part for improvements, betterments or equipment, which, according to the accounting system prescribed by the Commission, are chargeable to capital account.

For the purposes of the above provision, the Interstate Commerce Commission is given an appropriation and authority to make a physical valuation of the railway properties. Two methods of valuation were suggested. One, the historical cost of the property, and the other, the present cost of reproduction. The commission found that the historical cost of the railways of the country was almost impossible to determine. No uniform system of accounts had been in use and the railway companies' records were not considered to be of sufficient accuracy to permit determining from them the historical cost of the properties. An attempt, therefore, was made by the valuation section of the commission to determine the cost of reproduction new less depreciation. In making such valuation, methods are of the utmost importance.

The methods used by the Interstate Commerce Commission were almost universally objected to by the railroad companies. One fundamental method was adopted on a scale of prices in determining the present value of railway property as of the period prior to 1914. In the commission's decision, Finance Docket No. 3908, it says:

As hereinafter indicated, we arrive at a basic single-sum value as of June 30, 1919, of \$850,500. The value exclusive of land and working capital is \$750,000. Using the latter figure as a base merely for purposes of comparison and applying thereto the ratios referred to herein as indicating the average rise in wages and prices over the 1914 level for the years immediately following June 30, 1919, and adding to the result \$100,500 to cover land and working capital, the rate-making values for the respective recapture periods are shown to be as follows:

Period ended	Ratio	Rate-making value
June 30, 1919	100	\$ 850,500
Dec 31, 1920	230	1,825,500
Dec 31, 1921	195	1,563,000
Dec 31, 1922	157	1,278,000
Dec. 31, 1923	174	1,405,500

Different compilations yield different ratios, and those developed by the carrier are greater than the bureau's ratios. If, as is urged by many members of railroad counsel, current cost of reproduction virtually determines "fair value," the rate bases of the O'Fallon for the respective recapture periods would be not less than the amounts shown in the above table. Using these bases, it would have been necessary in 1920, disregarding other changes, to have increased the element in the rates and charges representing return by 114.64 per cent, in order to have given the owners of the property the return to which they are entitled. This would have been in addition to increases made necessary by higher operating costs. In 1921 there would have been a reduction of 14.38 per cent in this element, in 1922 a further reduction of 18.23 per cent, while in 1923 there would have been an increase of 9.98 per cent. The variations in the rate levels so required would have been about 30 per cent of these percentages, assuming an operation ratio of 70, but even so, there would have been large fluctuations.

Let us consider the effect of applying this doctrine of current reproduction cost to all railroad property in the United States. For convenience in calculation and for want of an accurate figure, we shall assume 18 billions as the value at 1914 unit prices of structures existing on June 30, 1919. The aggregate value which we used in *Ex Parte 74* at the time of the general rate increase of 1920 was \$18,900,000,000 for all property used for transportation purposes. But taking 18 billions as a base and applying the bureau's ratios, the value of precisely the same structures would have become 41.4 billions in 1920, 35.1 billions in 1921, 28.3 billions in 1922, and 31.3 billions in 1923. In other words, assuming a static property, there would have been a gain of 2.4 billions in 1920, a loss of 6.3 billions in 1921, a further loss of 6.8 billions in 1922, and a gain again of 3 billions in 1923. These huge "profits" and "losses" would have occurred without change in the railroad property used in the public service other than the theoretical and speculative change derived from a shifting of general price levels. To put it still more graphically, by the application of the current reproduction cost doctrine the assumed base of 18 billions would have been increased in 1920 by a sum greater than the present national debt (about 19 billions), and the transportation burden upon the people of the country would have been correspondingly increased without the investment of a single dollar by those who would reap the benefits.

The amendment to the Act to Regulate Commerce not only instructed the Interstate Commerce Commission to fix aggregate rates yielding a fair return on the value which the commission found for railway properties, but also provided that net railway operating income in excess of 6 per cent of the valuation fixed by the commission should be divided equally between the Government and the private corporation. One-half of the excess over 6 per cent should be paid to the Government to be used in making loans to railways which were unable to obtain loans from private bankers on satisfactory terms. The other half of the so-called excess earnings

was to be retained by the railway company but to be set aside until the aggregate of such excess earnings should equal 5 per cent of the total cost of the property.

The fair interest return for 1922 was fixed by the Interstate Commerce Commission at 5¼ per cent. According to a compilation made by H. H. Copeland & Son, New York, up to the end of 1928, the commission had found a final value for rate-making purposes of 171,267 miles of railway Class I roads out of a total mileage of 174,108, Class I roads, operated at the end of 1927, or 98.4 per cent of the total Class I railroad mileage. All of the important properties, such as the New York Central and Pennsylvania Railroad, have been valued. No important one of these railway companies has accepted the valuation placed on it by the commission, but taking one of the largest, in point of view of mileage and transportation service performed, the Pennsylvania, the commission has not allowed such rates as would yield 5¼ per cent on its valuation, even on as economically managed a property as that line holds. The ratio of net railway operating income of the Pennsylvania Railroad to the investment in road and equipment is given in the company's annual report for 1927 as follows:

Year	Per cent	Year	Per cent
1920	Del	1924	3.74
1921	1.88	1925	4.66
1922	1.72	1926	4.80
1923	4.07	1927	4.58

In 1928 the O'Fallen case was decided by the Interstate Commerce Commission, in which the commission found that two short railways—the Merchants Railway of St. Louis and the St. Louis & O'Fallen Railway had earned in excess of 6 per cent on the value of their properties as determined by the commission. In its decision, the commission pointed out that although the amount of money involved in the O'Fallen case was not great, the principles involved affect tremendous property values. This case was appealed from the Interstate Commerce Commission's decision to the United States Federal Courts. An appeal was taken to the Supreme Court, and the case came up for argument in January, 1929. The basic principle involved is a comparatively simple one, but even using the St. Louis & O'Fallen case as a test case where it was thought that the great mass of confusing elements which would have been involved in the valuation of such a railway system as the Pennsylvania were not present, yet the case as presented to the Supreme Court in 1928 was not as simple as here stated. Without legal technicalities and refinements, the case appears to be somewhat similar to this: Under the Interstate Commerce Commission's method of valuation, a given piece of railway is valued at \$20,000 per mile. This value is arrived at by taking the value of the rails at \$28 at ton, 1914 price, the value of the right of way through a town at \$10,000, again 1914 price, the cost of labor of laying ties and rails at 35 cents an hour, also 1914 price, the cost of building a station at \$4000, the brick, bricklayers' wages, etc., all being figured at 1914 prices. The railway's contention is that the present value of this mile of railway should be arrived at by taking \$40 or \$42 a ton as the cost of rails, 60 cents an hour as the cost of laying ties and rails, \$20,000 as the cost of right of way through a town, \$8000 as the cost of a station building, using present,

not 1914, prices for brick, bricklayers, painters, carpenters, etc. Some conception of the importance of this case to the railways may be had by taking the value of all the railways of the United States at \$18,900,000,000 under the commission's method of valuation and at least 50 per cent higher, or \$28,350,000,000, and at 6 per cent on \$18,900,000,000, the commission's valuation would give \$1,134,000,000 while 6 per cent on \$28,350,000,000 would give \$1,701,000. Net railway operating income is the net earnings of a railway company after paying expenses of operation and rentals of rolling stock and of leased properties, and after paying taxes. It is therefore of tremendous importance to the holders of railway securities, directly and indirectly, that is, depositors in savings banks and holders of life-insurance policies, a considerable part of the funds both of which institutions are invested in railway securities, whether earnings available for interest charges and dividends on railroad securities are \$1,134,000,000 or \$2,101,000,000. In 1929 the United States Supreme Court held that for the purposes of recapture of railroad earnings under the Transportation Act, the Interstate Commerce Commission in valuing the railroads had not given due weight to present prices. This so-called O'Fallon decision, while it did not direct the Interstate Commerce Commission to raise freight and passenger rates, did, to a large extent, make all the railroad companies free from recapture of earnings by the Government.

Important Provisions of the Amendment to the Act to Regulate Commerce and the Transportation Act. Beside providing that rates, as a whole, shall be fixed by the Interstate Commerce Commission so as to yield a fair return, the amendment to the Act to Regulate Commerce and the Transportation Act provided that before a new extension is built, or a new railway project is undertaken, the commission may issue a certificate of public necessity and convenience and without such certificate it shall be unlawful to undertake new railway construction.

The commission also may give its approval or disapproval to the issue of railway securities and the sale of these issues by the railway company to its own security holders or to its bankers. By withholding its approval the commission can make an issue of railway securities illegal. It undertakes to pass on the price at which securities shall be sold by the railway company.

In working out this law, especially in the five years preceding 1929, there was considerable discussion of whether the commission should require competitive bidding for railway securities. The contention of those in favor of competitive bidding was that municipalities and States sold their securities by competitive bidding and that it was feasible for the railways to do so. On the other hand, those opposed to competitive bidding likened the relations between a railway company and its bankers to that between an individual and his lawyers, or his doctor. It was pointed out that a man who was involved in a possible lawsuit did not shop around for a cheap lawyer who would take his case but rather paid the fee of the lawyer who had handled his business regularly heretofore; or, in the same way, a man who was sick did not advertise for bids by the doctors but called in his regular doctor regardless of whether or not some other doctor would have taken the case for a somewhat lower

fee. The argument that goes in favor of regular bankers would have been conclusive had the ethics of the relationship between bankers and railways been as high as the opponents of competitive bidding for railway securities assumed that it was. There was, however, one instance on a large scale which tended to show that this relationship was not regarded by railway bankers in the same light in which the higher type of lawyer regarded his relationship with his regular client.

The Chicago, Milwaukee & St. Paul, a system of railways owning 11,523 miles, and which in the past had a very high credit, having paid 7 per cent on both \$100,000,000 of common stock and on the same amount of preferred stock, built an extension during 1905 and 1906 from its Western terminus in the Dakotas to the Pacific coast. This extension was by far the largest piece of new railway construction undertaken in recent years. The credit of the Chicago, Milwaukee & St. Paul was used to finance the project. The new road, however, known as the Chicago, Milwaukee & Puget Sound, went through a territory which was productive of almost no local traffic. The line closely paralleled the Great Northern and the Northern Pacific, and on through business was competitive with these long-established railways. The new road was also competitive to some extent with the Canadian Pacific and National Railways of Canada.

The Chicago, Milwaukee & St. Paul had an issue of \$46,000,000 in 4½ per cent bonds due June 1, 1925. The regular bankers of the road who had sold its securities to finance the extension to the Pacific coast were Kuhn, Loeb & Co. This firm of bankers did not undertake to finance the extension or refinance the \$46,000,000 due June 1, and convention prevented other banking houses from offering to extend or refinance the bonds falling due on that date. The president of the Chicago, Milwaukee & St. Paul apparently regarded himself as representative of the bankers rather than trustee for the stockholders. At any rate, he made no efforts, or at least no efforts which were successful, to interest other bankers in the extension of the bonds due June 1, but, on the other hand, concurred in an application made for receivership by a supply company prior to June 1, when a comparatively small amount of interest was due and the counsel for the president advised that if this interest was paid and the \$46,000,000 due within a few months could not be paid, the payment of the small amount of interest due might be considered a preferential payment by which the president would make himself personally liable for damages.

Whether or not the Interstate Commerce Commission could have invited other bankers to refinance the bond issue due June 1, 1925, is a question that is hardly open for serious debate after the commission's own success in rejecting the specific bid for equipment trust certificates made by a banking house on the ground that the price at which the railway company sold the securities to its bankers was, in the commission's opinion, too low. At any rate, the Interstate Commerce Commission did not avail itself of the opportunity presented for constructive work in preventing a railway receivership. After the receivership had taken place in April, 1925, the commission instituted an investigation before an examiner into the receivership of the Chicago,

Milwaukee & St. Paul. Up to January, 1929, no comprehensive report of the commission's investigation had been made public. In the meantime, however, the same bankers who had failed to refinance the maturing bonds of the Chicago, Milwaukee & St. Paul reorganized the railway property under the name of the Chicago, Milwaukee & Pacific. The stockholders were compelled to subscribe for new securities if they wished to retain their stock interest in the company or rather to exchange their stock interest in the old company for a stock interest in addition to the bonds which they subscribed for in the new company, the bonds which they received for their so-called assessment were well secured and a hardship was worked on the stockholders only if it was inconvenient or impossible for them individually to put more money into the railway company in which they already had a part of their savings invested. The assessment was in the nature of what would be called, if the government of a small European country had made it, a forced loan. The powerlessness of the small stockholder in a railway is well illustrated in the case of the Chicago, Milwaukee & St. Paul. The proceeds of the assessment against stockholders was used to pay off a loan of \$60,000,000 to the Government. The outstanding illustration of the failure of the Interstate Commerce Commission to effect any radical improvement in the relationship between railway companies and their bankers was possibly the most historically important aspect of the Chicago, Milwaukee & St. Paul receivership.

Consolidations. In the amendment to the Interstate Commerce Act which amendment was passed in February, 1920, it is provided that:

(4) The Commission shall as soon as practicable prepare and adopt a plan for the consolidation of the railway properties of the continental United States into a limited number of systems. In the division of such railways into such systems under such plan, competition shall be preserved as fully as possible and wherever practicable the existing routes and channels of trade and commerce shall be maintained. Subject to the foregoing requirements, the several systems shall be so arranged that the cost of transportation as between competitive systems and as related to the values of the properties through which the service is rendered shall be the same, so far as practicable, so that these systems can employ uniform rates in the movement of competitive traffic and under efficient management earn substantially the same rate of return upon the value of their respective railway properties.

(5) When the Commission has agreed upon a tentative plan, it shall give the same due publicity and upon reasonable notice, including notice to the Governor of each State, shall hear all persons who may file or present objections thereto. The Commission is authorized to prescribe a procedure for such hearings and to fix a time for bringing them to a close. After the hearings are at an end, the Commission shall adopt a plan for such consolidation and publish the same, but it may at any time thereafter, upon its own motion or upon application, reopen the subject for such changes or modifications as in its judgment will promote the public interest. The consolidations herein provided for shall be in harmony with such plan.

(6) It shall be lawful for two or more carriers by railroad, subject to this Act, to consolidate their properties or any part thereof, into one corporation for the ownership, management, and operation of the properties theretofore in separate ownership, management, and operation, under the following conditions:

(a) The proposed consolidation must be in harmony with and in furtherance of the complete plan of consolidation mentioned in paragraph (5) and must be approved by the Commission.

(b) The bonds at par of the corporation which is to become the owner of the consolidated properties, together with the outstanding capital stock at par of such corporation, shall not exceed the value of the consolidated properties as determined by the Commission. The value of the properties sought to be consolidated shall be ascertained by the Commission under section 19a of this Act, and it shall be the duty of the Commission to

proceed immediately to the ascertainment of such value for the properties involved in a proposed consolidation upon the filing of the application for such consolidation.

(c) Whenever two or more carriers propose a consolidation under this section, they shall present their application therefor to the Commission, and thereupon the Commission shall notify the Governor of each State in which any part of the properties sought to be consolidated is situated and the carriers involved in the proposed consolidation, of the time and place for a public hearing. If after such hearing the Commission finds that the public interest will be promoted by the consolidation and that the conditions of this section have been or will be fulfilled, it may enter an order approving and authorizing such consolidation, with such modifications and upon such terms and conditions as it may prescribe, and thereupon such consolidation may be effected, in accordance with such order, if all the carriers involved assent thereto, the law of any State or the decision or order of any State authority to the contrary notwithstanding.

No comprehensive plan of consolidation was promulgated by the Interstate Commerce Commission, although the commission employed Prof. William Z. Ripley, of Harvard University, to prepare a tentative plan of consolidation, which he did, dividing the railways of the continental United States into twenty-one systems. The commission promulgated this plan with some modifications of its own as a tentative plan and in 1928 was engaged in drawing up a comprehensive plan, in accordance with which, presumably, the railway companies could work for consolidation.

The contrast between the situation in the United States and that in England is striking. Following the War, the English railways were returned to the private owning corporations under a plan for amalgamation into four large systems. "Amalgamation" is the English term which roughly corresponds with the American "consolidation." The English genius for getting things done practically and with substantial justice was manifest in the case of the railway consolidations. There were at the beginning of 1929 four large English railway companies—the London & North Eastern, the Great Western, the London, Midland & Scottish, and the Southern. These large systems have absorbed the smaller railway companies, with some exceptions, and in general, the scheme of English amalgamation has worked and is working, in 1929. On the other hand, the American Interstate Commerce Commission has failed to outline a plan for consolidation into a limited number of systems, and in 1929, there was before Congress the Parker Bill, which would relieve the commission of the necessity for drawing up such a plan.

Under private initiative, two important attempts have been made to form consolidations, both of which have been disapproved by the Interstate Commerce Commission. One was in the East and was advocated by the Van Schweringen Brothers, of which O. P. H. Van Schweringen is the most active member. They originally proposed the consolidation of the New York, Chicago & St. Louis Railway Company, called the Nickel Plate, with the Erie Railroad, the Chesapeake & Ohio, and the Père Marquette. The commission disapproved of this plan for various reasons, among which was the manner in which the consolidation was to be effected. The Van Schweringens bought the controlling stock of the Chesapeake & Ohio from the H. E. Huntington Estate, voted the stock to have themselves elected directors, and then as directors voted to lease the Chesapeake & Ohio to the Nickel Plate. The minority stockholders brought suit in the courts to prevent the consolidation and in the meantime the Van Schweringens and

their associates had gained control of the Erie and the Board of Directors of the Erie voted to lease that property to the Nickel Plate. Pressure was brought to bear upon the minority stockholders to consent to the plan approved by the majority stockholders, but in a long decision, the commission refused its approval of the consolidation. This decision was handed down by the commission in 1926. Later on, application was made by the Chesapeake & Ohio to lease the Erie and the Père Marquette. The commission refused its approval of the lease of the Erie, but approved the lease of the Père Marquette. A rehearing of the Erie case has been asked for and final disposition of the case had not been made and accepted by the beginning of 1929.

The other important merger case was known as the Lorce-Kansas City Southern case. The Kansas City Southern is a road with \$50,959,000 of stock outstanding and a total of \$62,696,800 of bonds. This company acquired a substantial stock interest in the St. Louis Southwestern, and the Missouri, Kansas & Texas. The Kansas City Southern runs from Kansas City south to Port Arthur, Tex., on the Gulf of Mexico. The St. Louis Southwestern runs from St. Louis southwest into Texas connecting Galveston, Houston, and Dallas, Tex., with St. Louis. The Missouri, Kansas & Texas runs from Kansas City and St. Louis southwest, serving some of the same Texas cities served by the St. Louis Southwestern. One of the chief objectors to the proposed consolidation was a man who had bought the so-called orphan line of the Missouri, Kansas & Texas, which had been sold at auction separately at the time that the Missouri, Kansas & Texas was reorganized following a receivership. He testified before the Interstate Commerce Commission that he had hoped and expected to sell his short line to the Missouri, Kansas & Texas, and that the proposed consolidation did not take this or other short lines into the consolidation. The commission refused its approval of the proposed consolidation in part on the ground that the Kansas City Southern was the smallest of the three companies and that for it, operating 841 miles of railway, to lease the Missouri, Kansas & Texas, operating 3189 miles of railway, was economically unsound, and because the consolidation did not provide for taking care of the short lines in the territory in which the consolidated company would operate. Apparently, an impasse has been arrived at between the Interstate Commerce Commission and the men who have been trying to effect consolidations, on the question of short lines.

It is well recognized that a railway system can be made profitable or unprofitable through a wise or unwise purchase of short lines in the process of expansion. Thus, the Atchison, Topeka & Santa Fe, under the very wise direction of E. P. Ripley, bought or built only lines that were profitable and added to the system's earnings. On the other hand, the early system of the Southern Railway was an illustration of how a large system could be brought almost to the verge of bankruptcy through the purchase of unprofitable short lines, which cost more to maintain and operate than they contribute in net earnings to the parent system. The Interstate Commerce Commission apparently interprets the consolidation provisions of the amendment to the Interstate Commerce Commission Act to be a mandate for forcing on the larger

railway companies with good credit the problem of development of the short-line railways. In the Southwestern merger case, an attempt was made to leave out these unprofitable lines on the theory that their inclusion would defeat the purpose of the consolidation, which of course was to form a profitable railway company.

Erie and New York, New Haven & Hartford. Even a brief record of the years from the outbreak of the World War in 1914 to the end of 1928 should include a reference to the great change in credit position of the New York, New Haven & Hartford and the Erie Railroad. The main line of the former runs from just outside New York City through New Haven, Conn., and Providence, R. I., to Boston, Mass. The system covers southern New England with a network, and in all the company operated, on an average during 1928, 2074 miles of railway. This means road miles, thus a mile of double track or four tracks is only counted as one mile of railway. The company paid dividends at the rate of 4 per cent on its common stock in 1928. In 1923 the New York, New Haven & Hartford earned \$133,940,586 gross, and the railway operating income after the payment of expenses, rentals, and taxes, was \$13,277,728 net. In 1927 the company earned \$139,824,315 gross, and the railway operating income was \$25,235,284 net. The very complete change which has come about in the credit of the company is reflected in the price of its common stock, which, in January, 1924, was quoted on the New York Stock Exchange at \$20. In January, 1929, it was quoted at \$87. In 1924 there was a possibility, at least, of the New York, New Haven & Hartford necessarily going through a receivership. By the beginning of 1929, apparently the management of the property had so completely overcome its operating difficulties that there was every prospect for a continued profitable operation.

New Construction. The *Railway Age* of New York has compiled each year since 1893 a comprehensive and intelligent record of the new mileage of railways built in the United States and in Canada. The following table, taken from the annual statistical number of the *Railway Age* for January, 1929, gives the road mileage built in each year, 1914-1928, inclusive.

NEW LINES OF RAILWAY COMPLETED IN THE UNITED STATES			
1914	1,532	1922	324
1915	933	1923	427
1916	1,098	1924	579
1917	979	1925	644
1918	721	1926	1,005
1919	686	1927	779
1920	314	1928	1,025
1921	475		

It will be noted that the largest number of miles built since 1916 was in 1928, both in the United States and in Canada, in the latter, the new mileage was as follows

NEW LINES OF RAILWAY COMPLETED IN CANADA			
1914	1,978	1922	145
1915	718	1923	655
1916	290	1924	615
1917	207	1925	414
1918	135	1926	335
1919	433	1927	310
1920	305	1928	723
1921	252		

Of the 1928 total, the Canadian National Railways built 291 miles and the Canadian Pacific, 378 miles.

In the period since the War, the development of railways in the United States has been intensive rather than extensive. The *Railway Age* compiles also a record of railway mileage equipped with automatic signals. This record shows the following figures, the figure for 1914 being taken from records of the Interstate Commerce Commission, the later figures being those compiled by the *Railway Age*:

1914	3,294	1922	1,254
1915	1,296	1923	2,019
1916	1,891	1924	2,515
1917	2,482	1925	2,726
1918	1,934	1926	4,992
1919	1,923	1927	5,127
1920	546	1928	3,121
1921	830		

Two important developments of the years just prior to, and including, 1928 have been, first, the installation of distant switches controlled by a tower-man permitting a train to take a passing siding at the direction of a tower-signalman and, second, the installation of switching yards with so-called car retarders which are manipulated from a tower, thus reducing the possibilities of accident due to human error under the old method by which a switchman rode on each individual freight car and applied the hand brakes to bring his car to a stop at approximately the point to which it had been switched either by gravity or by a switching locomotive.

Equipment Prices. It is interesting to note the trend of prices of railway equipment. In 1914 the average price per pound of locomotives was about \$6.837, in 1927 it was \$17.415 per pound. In 1914 the average price for all-steel cars was around \$2.49 per pound and in 1927, \$4.02. For composite wood and steel cars, the average price was \$2.37 per pound in 1914 and \$4.95 in 1927. The price for all-wood cars was \$2.25 per pound in 1914 and estimated to be \$4.45 per pound in 1927. To give some idea of the weight of locomotives and cars used on railways in 1928, a few typical examples are given: Thus, in 1928 the Chicago & North Western ordered 12 locomotives weighing on an average of 395,000 pounds, the Erie ordered 35 locomotives averaging 461,470 pounds; the Southern Pacific ordered 10 locomotives averaging 614,600 pounds. In 1928 the Chicago & North Western ordered 23 suburban coaches averaging 99,600 pounds each; the Erie, 25 suburban coaches averaging 101,500 pounds each; the Southern Pacific, five passenger coaches averaging 143,000 pounds each. It must be remembered of course that prices of railway equipment vary from year to year and from month to month within the year and also vary according to the amount of business on hand with the equipment builders.

A typical locomotive ordered by the Southern Pacific in 1928 was of the 4-6-2 type; that means there were four wheels on the front truck, six drivers, and two wheels under the cab. The tractive force of this locomotive was 43,060 pounds. It was equipped with a booster, which is an auxiliary engine giving it additional tractive effort, for use principally in starting. The total tractive force with the booster was 53,000 pounds.

In 1928 considerable progress was made in equipping refrigerator cars with cooling devices other than ice. The application of solid carbon dioxide, the so-called dry ice, as a substitute for water ice in the refrigerator cars was ex-

perimented with but up to the end of 1928 had not reached the stage of practical commercial application.

Julius H. Parmalee, director of Railway Economics, writing in the *Railway Age*, summarizes the results of railway operations in 1928 as follows:

1. Freight traffic for the year was almost exactly the same as in 1927. The traffic for the first six months was about four per cent below that of the corresponding period of 1927, while the traffic of the second six months was about four per cent above 1927.

2. Passenger traffic declined in every month of 1928, the decrease for the year being about six per cent.

3. Operating revenues declined less than one per cent. There was a large decline during the first six months, and an increase during the second six months. The gross revenues of 1928 were less than in 1923, 1926 and 1927, but were greater than in any other preceding year.

4. Operating expenses were reduced by economical management and by the increased efficiency methods, to the extent of 3.2 per cent, bringing the total expenses of the year below that of any preceding year since 1922.

5. The operating ratio, which stood at 72.6 per cent in 1928, was lower than any year since 1917, and marked a real achievement on the part of the railways with respect to their ability to control their expenses.

6. Net railway operating income amounted to \$1,180,000,000, which was an increase over 1927 of 95 millions, but was less than in 1926 by 53 millions.

7. Railways earned a rate of return on property investment of 4.65 per cent in 1928. This rate was higher than in 1927, but lower than in 1925 and 1926.

8. The railways attained maximum levels of performance in at least nine factors of efficient operation, and reached a high level of performance in many of the other factors.

9. General railway efficiency in 1928 was on a higher level than in any year since the War, as indicated by an index of the principal significant factors of railway efficiency.

RAILWAYS, ELECTRIC. See **ELECTRIC RAILWAYS.**

RAINIS, JANIS (1865-). Pseudonym of Janis Pheksāns, a Latvian poet and dramatist. Considered the chief representative of classic and social literature in Latvia, he is the author of ten volumes of poetry and four volumes of translations from the literature of many languages. His play, *The Sons of Jacob* was presented in London in 1924. His other dramatic works include *Pusdiecists* (1904), *Uguns un nakts* (*Fire and Night*) (1907), *Indulis un Arija*; *Joseph und seine Bruder* (1921); *Das goldene Ross* (1922). His collected works, *J. Raina kopoti raksti*, were published in two volumes (1912-14). Among his volumes of poetry are *Wehras seja* (1905); *Tālas noskaņas zilā rokarā* (1909).

RAISA, ROSA (1893-). A Russian dramatic soprano, born at Bielostok. To escape the horrors of the Jewish persecutions, her parents fled (1907) to Naples, where she received her musical education at the Conservatory under Barbara Marchisio. She made her debut at Parma (Sept. 6, 1913) in Verdi's *Oberto*, *Conte di San Bonifacio*, during the Verdi centenary celebration under Campanini, the director of the Chicago Opera Association. Campanini engaged her the next year for Chicago, where she remained as one of the principal stars and a prime favorite. She has appeared with brilliant success also in London, Rome, Buenos Aires, Montevideo, Rio de Janeiro, São Paulo, and New York. Toscanini chose her to create the rôle of Asteria in the world première of Bortolotti's *Nerone* (Milan, May 1, 1924). In 1920 she married the operatic baritone Giacomo Rimini.

RAISULI, RI-SOULI, ACHMED BEN MOHAMMED (1868-1925). A Moroccan bandit and political leader (see Vol. XIX). Instigated by Germany, he led a revolt against the French government in

Morocco in 1918 and continued active until 1923, when he surrendered. He was also a leader in the Rif Rebellion against Spain in Spanish Morocco. In 1924 he opposed Abd-el-Krim. Early in 1925, he was taken prisoner by the latter, and died in prison. See Morocco.

RÁKOSI, RA'KÓ-SÉ, JENŐ (EUGEN) (1842-1929). A Hungarian author (see Vol. XIX). He continued to publish his radical paper *Buda-pesti Hírlap* from 1881 to 1925, when he joined the editorial staff of *Pesti Hírlap*. Consult *Eugen Rákosi der Journalist*, by F. Popp (1925).

RAMON Y CAJAL, RÁ-MOŪ' É KÁ-HUL', SANTIAGO (1852-). A Spanish histologist (see Vol. XIX). He retired as professor of normal histology and pathological anatomy at the University of Madrid in 1922. He was honored by numerous European and American universities and learned societies and, while he was still alive, a monument in his honor was erected at Zaragoza. His later works include *Estudios sobre la degeneración y regeneración del sistema nervioso* (2 vols., 1913-14), and *Recuerdos de mi vida* (3 vols., 1901-17).

RANDOLPH-MACON WOMAN'S COLLEGE. An institution for women at Lynchburg, Va., under the auspices of the Methodist Episcopal Church, South, founded in 1893. The number of students registered increased from 610 in 1914 to 853 in 1927-28, the faculty members from 47 to 65 in 1928-29, and the library from 12,500 to 30,000 volumes. The total yearly income was increased from \$183,227 in 1914 to \$565,512 in 1927-28, and during 1928 the college completed a campaign for increased endowment which brought the invested funds up to more than \$1,200,000, as compared with \$376,500 in 1914. A Phi Beta Kappa chapter was installed in 1916 and a Psi Gamma Mu chapter in 1925. A number of new buildings were added to the plant, including the Smith Memorial Student Building, Webb Dormitory, the president's home, and an observatory, and in 1928 a new library to cost \$150,000 was under construction, while \$50,000 was pledged by the Presser Foundation of Philadelphia toward the erection of a Fine Arts Building for which the college was to raise an additional \$50,000. President, Dice Robins Anderson, Ph.D., LL.D.

RANGE. See **ARTILLERY.**

RANGSTRÖM, (A. J.) TURE (1884-). A Swedish composer and conductor, born in Stockholm. In 1905-07 he studied singing with Julius Hey in Berlin and Munich, and then composition with J. Lindegren in Stockholm, where he settled as teacher of singing and critic of the *Scenska Dagblad* (1907-09), *Stockholms Dagblad* (1910-14), *Dagens Nyheter* (1920-21), and again of the *Stockholms Dagblad* after 1927. In 1922-25 he was conductor of the Orkesterforening in Götting. In 1919 he was elected member of the Royal Music Academy of Stockholm. His principal works are the operas *Die Kronbräut* (Stuttgart, 1919; Stockholm, 1922) and *Middeldalderlig* (Stockholm, 1921); two symphonies; several orchestral suites; *Dithyrambe, Ein Herbstgesang, Ein Mittsommerstück, Es singt das Meer, Intermezzo drammatico* for orchestra, *Ballade* for piano and orchestra; two suites for violin and piano, No. 1, *In modo antico*, No. 2, *In modo barocco*; *Rhapsodie* for string-quartet; incidental music to Isen's *Brand* and Strindberg's *To Damascus*.

RANKIN, JEANNETTE (1880-). An American public official, born in Missoula, Mont.,

and educated at the University of Montana and the School of Philanthropy in New York City. She engaged in social work in Seattle and took an active part in woman-suffrage work; she was field secretary of the National American Woman Suffrage Association. In 1917 she was elected to Congress as Representative-at-large from Montana and was the first woman ever seated in that body. She was defeated for reelection in 1920.

RANSDELL, JOSEPH EUGENE (1858-). A United States Senator (see VOL. XIX). He was reelected to the Senate in 1918 and 1924 for the terms 1919-31. He has been a member of the Senate committees on agriculture, civil service, commerce, interoceanic canals, and printing. One of the organizers (in 1919) of the National Merchant Marine Association, he has served as its president.

RANSOME, FREDERICK LESLIE (1868-). An American geologist, born at Greenwich, England, and educated at the University of California. He was assistant in mineralogy and petrography at Harvard and entered the service of the United States Geological Survey where from 1900 to 1923 he was geologist, in charge of various sections of Western areal geology (1912-16) and later of metalliferous deposits. During the World War, Dr. Ransome was connected with the National Research Council. He was treasurer of that organization and of the National Academy of Sciences in 1919-24. He was professor of economic geology at the University of Arizona, 1923-27, and after 1927 held a similar professorship in the California Institute of Technology at Pasadena. In addition to being associate editor of *Economic Geology*, he is the author of many official monographs on the geology of western mining districts and papers in scientific journals.

RAPALLO. TREATY OF. See (GERMANY, under *History*; ITALY, under *History*; FUME-ADRIATIC CONTROVERSY; PEACE CONFERENCE AND TREATIES.

RAPID TRANSIT. Notwithstanding the World War and the unsettled condition of the various countries following the Armistice, there was no single question that aroused more general interest in and about large cities than the provision of adequate urban and suburban transit facilities. This was due in large measure to the phenomenal growth of the large cities, and the concentration of activities and industries in certain districts at a distance from available housing facilities.

The problem was not entirely one of new or additional subways, there were cities where elevated railways were constructed in the period under consideration, and also cities where important readjustments and at times relocations of surface traffic were demanded so as to relieve in a measure the congestion which prevented the proper handling of the traffic especially at the times of peak load and when the streets were thronged with vehicular and pedestrian traffic. Indeed the subway idea has been slow in spreading to other cities from the few big centers where subway building has been undertaken.

The troubles were not only of construction. Since 1914 costs of operation, due particularly to increased cost of materials and labor, have mounted so that in many American lines what was considered the standard fare of five cents has become inadequate to meet even operating costs, while in some parts of the United States

the operation of interurban or suburban lines is no longer possible due to the competition of motor vehicles both public and private. In New York City in 1919, the New York City Railways and the Brooklyn Rapid Transit Company went into the hands of a receiver, while the Interborough Rapid Transit Company later was saved only by careful financing.

So serious was this situation in the United States that in 1920 when the report of a Federal Electric Railway Commission, appointed by President Wilson, May 31, 1919, was issued, it was frankly stated that the electric railway industry was without financial credit and was not properly performing its public function. The reason for this was given as early financial mismanagement, various economic causes accentuated by high price levels of labor and materials, and the failure of the five-cent fare to provide revenues adequate to meet operating costs, maintenance, and necessary extensions. See ELECTRIC RAILWAYS.

Throughout the United States there was a movement toward government operation and ownership, which often was revealed in oppressive measures of regulation that interfered with the efficient and profitable conduct of the various utilities. See MUNICIPAL OWNERSHIP.

New York City Subways. The years after 1914 witnessed important developments in New York, but also a disintegration of the existing system of surface lines and a great delay on the part of the municipal authorities in developing plans for additional lines much needed and in providing means to carry them into effect. The so-called Steinway Tube under the East River from 42nd Street, Manhattan, to Long Island City was opened in 1915 as a part of the Interborough Rapid Transit system. The dual subway system was further developed and the various lines of the New York Municipal Railways including the Broadway subway were opened in 1917 and 1918 and were extended from time to time; but the complete development of the dual system along the lines originally laid out was long delayed on account of the hostility of the New York municipal government, which was favorably disposed toward city-owned and -operated transit facilities and absolutely opposed to any increase of fare over the time-honored five cents.

The carrying capacity of the elevated railways was extended by the building of third tracks over which express trains were run to take care of the heavy traffic at morning and night. On Jan. 1, 1929, New York City had in operation 602.6 miles of subway and elevated main track, or a total of 214.8 route miles. Including sidings, special work, and yards, the total trackage was 730.7 miles. Of the main tracks, 340.6 miles were operated by the Interborough Rapid Transit Corporation and 288.7 miles by the Brooklyn-Manhattan Transit Corporation, a successor to the New York Municipal Railroad, with 26.7 miles of the total under joint operation of the two companies. The Interborough system included 118.1 miles of company-owned and 222.5 miles of city-owned main track; the B. M. T. system, 147.1 miles of company-owned and 141.6 miles of city-owned main track.

In the meantime, the delay due to difficulties between the State-appointed Public Service Commission for the First District (New York City) and the city authorities as well as the five-cent fare issue continued to hold up much needed additional subway construction. All lines were

badly overcrowded, but little was actually accomplished to relieve the situation. Finally, in 1924 the New York City Board of Transportation took over subway building under the "police power" of the State Transit Commission.

The election of 1925 was practically a "subway election" and afterwards work was begun on the much needed north and south line (so-called Eighth Avenue Line) in Manhattan, and on various other projects included in a new municipal-owned subway system. Of the 54.79 route miles constituting the first unit of the city's new system, in 1929 there were under construction 37 miles of subway in the Boroughs of Manhattan, Bronx, Brooklyn, and Queens, estimated to cost approximately \$305,000,000. This work included two tunnels under the East River and one under the Harlem River. Construction of the Eighth Avenue line, extending 12.3 miles from Fulton Street to 212th Street, had been practically completed and contracts awarded for the operation of the line, which is expected to begin in the spring of 1931. Equipment, including 300 steel cars, block signals, and six substations for power transmissions, was ordered in August, 1929. Other sections of the new system under construction included 2.16 route miles of the Fifty-Third Street-Long Island City line, 5.71 miles of Brooklyn cross-town line; 2.63 miles of Houston-Jay Street line, 7.31 miles of Cranberry-Culver line; 5.85 miles of Bronx Concourse line; 11.66 miles of Long Island City-Jamaica line; 4.97 miles of Schermerhorn-Fulton Street line, and 2.2 miles of Sixth Avenue line. The question of the operation of the new subways had not been decided in 1929. It seemed probable that the city would operate them and also take over and operate all or part of the existing privately owned subways on the five-cent fare basis, with the taxpayers shouldering the operating deficit. Up to September, 1929, the Board of Estimate and Apportionment of New York City had authorized the expenditure of a total of \$388,000,000 for construction and equipment of that part of the first unit of the new system which was under contract. Of the route mileage under construction 19.67 miles was in Manhattan, 5.23 miles in the Bronx, 16.87 miles in Brooklyn, and 13.02 miles in Queens.

Plans tentatively adopted 1929 for the second unit of the new subway system call for the construction of an additional 100.12 route miles and 294.81 track miles of line, to cost \$438,400,000. Of this total, 11.87 route miles, costing \$126,800,000, would be built in Manhattan, Bronx, 19.04 route miles, costing \$78,000,000, Brooklyn, 16.84 route miles, \$114,500,000, Queens, 52.37 route miles, \$119,100,000.

Boston. The Boston Transit Commission ceased to exist on June 30, 1918, after 24 years of existence during which it had developed a comprehensive traction system for that city and had supplied all of the facilities called for, or rather all that means were available for constructing. After the elevated railways had been constructed and the subway from Tremont Street to Cambridge, the next section, the Boylston Street subway, running through the Back Bay District to the junction of Commonwealth Avenue and Beacon Street, was opened on Oct. 3, 1914. Following this came the section to Andrew Square, Dorchester, which was opened in 1918 and which was further extended in 1925. In addition, there were completed the Washington Street and East Boston subways, so that

Boston had a well unified system of subways while in 1928 an extension of the Boylston Street Subway was authorized at a cost of \$5,000,000, half to be met by the Boston Elevated Road and half by the City of Boston. Operation of the Boston Elevated Road passed into the control of a Board of Trustees on July 1, 1918, and to meet deficiencies in revenue, the fare was raised from five to seven cents on August 1, and later in the year to 8 cents. Even this was insufficient to meet operating costs, as was a 10-cent fare adopted later.

Philadelphia. Rapid transit development has been an important feature in Philadelphia. An existing subway ran east and west under Market Street, terminating in a short north and south elevated line along the river front, and on Apr. 26, 1915, the city voted a bond issue to provide for the construction of a subway which would cross under the older one at the City Hall and extend north and south under Broad Street. There was also involved an elevated line to Frankford which was completed in 1919. The next elevated line to be built was the Woodland Avenue section of the Darby route. The construction referred to as gradually completed, however, did not meet the requirements and in 1923 a general and comprehensive plan was under consideration of which various extensions of the subway routes and elevated lines were decided on. By 1928 the new subway north from City Hall had been completed, the first train going into service on September 1, and was under operation on a temporary and tentative plan pending a decision as to final arrangements. Work was being actively pushed on the line south from City Hall.

Chicago. The City of Chicago, with its surface and elevated railways, has experienced a congestion of traffic no less than other American cities, but little has been done beyond discussion and the preparation of plans.

Detroit. The City of Detroit, which in 1922 had purchased the street railway lines of the Detroit United Railway Company and added 72 miles of new track to the system, was so near its debt limit that little could be done in the way of bond issues for providing funds for developing increased transit facilities or improving then existing conditions. In 1929 a rapid transit subway plan which had been under consideration for several years was submitted to the voters but failed of adoption.

Cincinnati. In 1915 plans for an extensive rapid transit system involving a belt line surrounding the city were adopted, and in the following year a bond issue for this purpose was authorized. The execution of the project was postponed on account of the World War until 1921, when the subway portion was put under active construction using for part of the route the abandoned Miami and Erie Canal, thus decreasing construction costs materially. The loop as planned was about 16.45 miles in length and consisted of 2.45 miles of subways; 9 miles in the open cut with bridges or subways at intersecting streets; 0.2 miles of tunnel; 3.4 miles of concrete trestle, and 1.4 miles of concrete elevated structure. The line begins at Fountain Square and extends north in subway to Walnut Street, where it joins the canal and thence west in subway to Plum Street, where the line turns north in subway to Brighton whence a circuit is made returning to the starting point. Another important development in Cincinnati was the con-

struction of a large doubled-decked terminal for interurban electric cars which served also as an annex to a large office building. This terminal was connected by a viaduct with the Covington Bridge over the Ohio River. There was also accommodation here for the Newport cars which crossed on the Newport or Central Bridge and running on the surface entered the first floor of the terminal. See CINCINNATI.

St. Louis. With the development of its suburbs and the congested condition of traffic in its business district, the city of St. Louis was forced to take under consideration some plan in which the street railways would be extended and rerouted and conditions relieved as by the construction of a subway loop. The City Plan Commission, the Department of Public Utilities, and other organizations were considering this problem in its many hearings, but no actual construction work had been started up to 1929.

London. At the time of the outbreak of the World War in 1914, the various city and suburban railway lines in and about London were engaged in various improvements and extensions. The suburban lines such as that of the London and Northwestern from Euston to Harrow were electrified, and the electrification of the line between Hammersmith and Earls Court of the District Railway Company vastly increased the daily number of trains. The general plan was to tie in as far as possible the suburban lines with the urban tubes and to adopt electrification as rapidly as possible. Naturally, the War interfered with the immediate execution of many of the projects planned, but with the return of peace such plans were set on foot as the connection of the Central London line with the suburban system of the London and Southwestern Railway, so as to afford an alternative route from the Hammersmith district into the city and to extend it as far as the suburban district of Ealing. The most notable improvement, perhaps, was the reconstruction of the City & South London line, the first and smallest of the many tubes which had been built in London. This tunnel was increased to standard dimensions so that its traffic could be exchanged with the Hampstead line and provide for through traffic between the northern and southern districts of London. The scheme of extension undertaken also involved a connection between the City & South London Railway and the Charing Cross, Euston & Hampstead Railway extending from Euston to Morningside Crescent, and the extension of the Hampstead Railway from Golders Green to Edgware. In addition to the important passenger routes, an electrically operated underground rapid transit mail railway was built to connect the chief post offices and trunk-line depots in the London district. The tubes have an inside diameter of 9 feet and contain a track of 2-foot gauge over which trains of motor cars are operated by a remote-control system. Still more recently, the Piccadilly Circus station of the London Electric Railway Company has been rebuilt and the work of bringing the London tubes into a more complete and up-to-date system has continued.

Madrid. In 1919 the City of Madrid completed and put into operation the first 3 miles of its subway system extending from the northern part of the city to Puerta del Sol, the centre of the business district. This was followed by construction carrying the line to the station of the eastern and southern railways.

In 1929 there was opened an extension of 1.15 miles, making the total length six miles. This extension is built under a main thoroughfare and has three stations. Its maximum grade is 3 per cent. The track is laid with 80-pound rails, but these are 59 feet long instead of 36 feet, as on the older part of the line. Their joints also are welded solid, expansion joints being provided at intervals of approximately 1000 feet.

Barcelona. In 1924 there was completed in Barcelona, the commercial capital of Spain, the first subway system, which was designed to connect the surface railways entering the city from the east and west. On Apr. 12, 1924, there was a temporary setback when a portion of the vault in the centre of the mediaeval city fell, causing a large breach in the street and the footways above, but the work was prosecuted with such vigor that it was opened in December. In 1928 a royal concession was granted for building a subway between Barcelona and Badalona, an important manufacturing city 5.6 miles from the metropolis, to be completed within four years at an estimated cost of 50,000,000 pesetas.

Sydney, Australia. An interesting transit scheme has developed for Sydney, New South Wales, which involve both underground and elevated lines and a combination of new urban facilities with those of existing routes. The urban and suburban railways were electrified and extended into and around the city so as to form a city loop, from which railways lead to the western and eastern suburbs served by a street railway service system. This new work was being undertaken in connection with the electrification of the suburban steam railways terminating at the Central Railway Station on the city side of the harbor, and at Milson's Point. From there, passengers would be brought into the city and distributed over four underground and two open-air stations on the city loop. The first part of this work was opened in 1926. See TUNNELS, BRIDGES.

Tokyo Subway. The first city of the Orient to adopt the subway as a means of rapid transit opened its first work late in December, 1927. Only 1½ miles long and equipped with 10 all-steel cars, this line, built like the New York subway, doubtless marks the beginning of such construction in the East. It connects two sections of Tokyo, Ueno and Asakusa, for which surface facilities had proved inadequate, and is privately owned.

RASKOB, JOHN J. (1879-). An American capitalist and political leader. He was born at Lockport, N. Y. and received a public-school and business-college training. He rose from assistant treasurer to vice president and member of the finance committee of the J. I. duPont de Nemours Company of Wilmington, Del., becoming also vice president and chairman of the finance committee of the General Motors Corporation. In 1919 he was a member of President Wilson's Industrial Conference. During the presidential campaign of 1928, although previously a Republican, he served as chairman of the Democratic National Committee.

RASMUSSEN, rás'mus'sen, KNUD (JOHAN VICTOR) (1879-). A Danish Arctic explorer (see VOL. XIX), who, after 1912, made five expeditions in North Greenland and the American Arctic. His acquaintance with the Eskimos furnished material for some unusually interesting books which include. *Liv i Grønland*

(1915); *En Grønlands Drom* (1915); *Min Rejse-dagbog* (1915); *Sermerssnaikut Tunniarnilers-somlut* (1916); *Nye Mannesker* (1919); *Grønland lands Polhavet* (1919); *Myter og Sagn fra Grønland* (1921), which in the English translation is called *Eskimo Folktales* (1921); *In the Home of the Polar Eskimos* (1923); *Myter Og Sagn fra Grønland* (3 vols., 1921-25); *Fra Grønland til Stille havet* (1926); and *Across Arctic America* (1927).

RASPUTIN, ra'spōō-tēn', GREGORY (1871-1916). A Russian monk and royal favorite (see Vol. XIX). Through the Czarina, he exercised an unwholesome influence over appointments to ecclesiastical posts and, during the first years of the World War, over the national and foreign policies of the Czar. The wide publicity which his immoral conduct and his relations with the royal family received had an increasingly alarming effect upon the public morale. During the night of Dec 31, 1916, he was murdered by influential enemies, headed by Prince Yussupov, and his body thrown into the Neva River, where it was found the following day. Consult *Rasputin and the Russian Revolution*, by Princess Catherine Radziwill (1918); *Rasputin*, by Prince Felix Yussupov (1927); and *Rasputin: The Holy Devil*, by René Fulop-Müller (1928). See RUSSIA, under *History*.

RATHENAU, ra'te-nō, WALTER (1867-1922). A German political economist and statesman, born in Berlin, and educated in the German technical schools. In 1899 he established the first factory for electrochemical specialties in Germany. He rose rapidly as an industrial organizer and leader and became in 1915 president of the all-powerful Allgemeines Electrische Gesellschaft. During the years 1908 and 1909, he served as an economic representative of the German government in the East African colonies. When the World War broke out, he was in charge of official organization of the food supply, but did not remain in office more than a year. After the German revolution, having identified himself with the radical parties, Rathenau was appointed Foreign Minister (1921). He went to the Genoa Conference with a policy of conciliation between Germany and the Allies. Although he negotiated a treaty of friendship with the Russian Soviet government (the Treaty of Rapallo), his Genoa mission did not accomplish its purpose. In June, 1922, he was assassinated at the instigation of reactionary groups, who could not forgive either his radical policy or his Jewish ancestry.

Rathenau was one of the few German leaders who combined a remarkable ability at industrial organization with philosophic grasp of the cultural needs of modern societies. His writings range from speculative philosophy of the type called professional to the problems of industrial efficiency, and they pass by the highly treacherous shoals of social and economic policy. His *Von Kommenden Dingen* (1918) and *Was Wird Werden*, translated as *In Days to Come* (1921), combine prophetic vision with a scientific understanding of sociological intricacies. His other works include *Gesammelte Schriften* (3 vols., 1918), *An Deutschlands Jugend* (1918); *Kritik der dreifachen Revolution* (1919); *Die neue Wirtschaft* (1919); *Nach der Flut* (1919); *Die neue Gesellschaft* (1919; Eng. trans. *The New Society*, 1921); *Autonome Wirtschaft* (1919); *Kaiser* (1919); *Demokratische Entwicklung* (1920); *Cannes und Genua*, four speeches on rep-

aration (1922); and *Der Neue Staat* (1922). His *Collective Writings* were published in two volumes (1918 and 1925), while his *Speeches* appeared in 1924.

RAVEL, MAURICE (1875-). A French composer, born at Ciboure, Basses-Pyrénées. He received his musical training at the Paris Conservatoire under C. de Bériot (piano), A. Gédalge (counterpoint and fugue), and G. Fauré (composition). In 1901 he won the second Prix de Rome with a cantata, *Myrrha*. In 1920 he was made Chevalier of the Legion of Honor. In 1928 he made a tour of the United States, appearing as pianist and conductor. As a composer, he is one of the most prominent of the impressionists, second perhaps only to Debussy. While he does not shrink from daring harmonies, unresolved dissonances, and complicated rhythms, his themes are more pregnant and definite than those of most impressionists. His talent appears to best advantage in the finely wrought details of works in the smaller forms, especially in the compositions for piano. He wrote the operas, *L'Heure Espagnole* (Paris, 1911; Chicago, 1920), *La Cloche Engloutie* (not yet produced), *L'Enfant et les Sortilèges* (Monte Carlo, 1925), and *Pour ma Fille* (Paris, 1927); the ballets, *Daphnis et Chloé*, *La Mère l'Oye*, and *Adelaide ou le Langage des Fleurs* (all in Paris, 1912), and *Portrait d'Enfant* (Paris, 1926), an overture, *Shéhérazade*, *Rapsodie Espagnole*, a choreographic poem, *La Valse*, a piano concerto on Basque themes, *Trois Poèmes* (Mallarmé), for voice, piano, two flutes, two clarinets, and string quartet, *Shéhérazade*, for solo voice and orchestra, some chamber music; songs, and piano pieces, among which the *Valses Nobles et Sentimentales* are particularly fine.

RAWLINSON, HENRY SEYMOUR, FIRST BARON OF TRENT (1864-1925). A British soldier educated at Sandhurst. He entered the army in 1884 and served in India, Burma, the Sudan, and in the South African War (1899-1902). In 1914 he was director of recruiting, but soon entered active command. During the heavy fighting of the Somme (1916), he commanded the 4th Army, the next year was made a general, and for a short time in 1918 was a member of the Allied War Council. Later in that year, he reorganized the broken 5th Army, and then returned to the command of the 4th, driving the Germans over the Hindenburg line. He received many decorations, both British and foreign, and in 1919 was raised to the peerage. In the same year he was commander of the British forces in northern Russia, and in 1920 he became commander-in-chief of the Army in India, and a member of the Executive Council of the Governor General, positions which he held until his death. He wrote *The Officers' Note-book*. Consult *The Life of General Lord Rawlinson of Trent, from His Journals and Letters*, edited by Major General Sir Frederick Maurice (1928).

RAY, CHARLES (1891-). An American actor, born in Jacksonville, Ill., best known for his work in motion pictures. He began his career on the legitimate stage in small parts in stock and vaudeville. *The Coward*, *The Deserter*, *The Dividend*, *The Punch Hat*; and *The Clodhopper* were his best film pieces up to 1920, when he incorporated his own company and produced George Cohan's *Forty-five Minutes from Broadway*; James Whitcomb Riley's *The Old Swimmer's Hole*; Charles Van Loan's *Scrap*

Iron; Charles Hoyt's *A Midnight Bell*; and a number of other comedies.

RAYON. The artificial silk industry on a commercial scale dates from about 1889 as a result of the work of Chardonnet and other investigators in the chemical treatment of cellulose so as to render it capable of being spun in a colloid state into fibres later solidified. Such a material has many of the properties of silk fibre, including gloss, lightness, fineness, and susceptibility to dyes. Known at first as artificial silk, the name of rayon came to be applied to any one of a group of chemically produced textile fibres or the yarn or tissue made therefrom. The term rayon, which previously had been used in France, came into general use in the United States and Great Britain about 1924, in which year it was adopted and approved by the National Retail Dry Goods Association and other trade associations. Rayon now began to figure no longer as a substitute, but as a distinct fabric with certain properties which manufacturers and consumers were quick to appreciate. The yarns gradually were improved and developed so that richer and more useful fabrics could be woven.

In 1928 the world's production of rayon was estimated at about 347,940,000 pounds distributed as shown in the accompanying table taken from the *Textile World* (New York). It will be

UNITED STATES RAYON PRODUCTION, IMPORTS, AND AMOUNT AVAILABLE FOR CONSUMPTION*
(From Commerce Reports
(In thousands of pounds))

Year	Approximate domestic production	Imports for consumption	Total available for consumption

* Source: United States Tariff Commission for years 1913 to 1922, inclusive, production figures for 1924, 1926, and 1928 are estimates of the *Daily News Record* of New York City, while for 1923, 1925, and 1927 official census figures are used, other figures are from records of the Bureau of Foreign and Domestic Commerce.

The American rayon production is approximately 100 per cent greater than that of the nearest foreign competitor, yet at the same time there are extensive imports of rayon yarns into the United States, the total in 1927 amounting to 16,235,724 pounds, valued at \$13,664,493, and in 1928, to 12,733,590 pounds, valued at \$10,901,789.

IMPORTS OF RAYON YARNS INTO THE UNITED STATES
(From Commerce Reports
1927)

Country	Quantity Lbs	Value	Quantity Lbs	Value
Austria	425,630	\$ 292,026	156,883	\$ 129,491
Belgium	585,815	432,025	868,164	611,120

Total	16,235,724	\$13,664,493	12,733,590	\$10,901,789

seen that in 1928, as in previous years, the United States led in the world's production. Furthermore, it is quite apparent that rayon manufacture is quite generally distributed throughout the world. In fact, in addition to its own production, the United States imported during 1928 rayon valued at \$15,500,158, in which figured yarns, threads, and filaments to the amount of 12,742,418 pounds, valued at \$10,905,531.

WORLD PRODUCTION OF RAYON BY COUNTRIES
(From *Textile World*)

Country	1926	1927	1928

* Included in "all others."

In the American industry, four processes are used to treat the cellulose, which is obtained from cotton linters or wood pulp, usually spruce, and is the basic raw material. In 1928 the distribution of the American production by processes was as follows: viscose, 84 per cent of the total; nitrocellulose, 9 per cent; cellulose acetate, 5 per cent, and cuprammonium, 2 per cent.

The rayon industry in the United States dates from about 1911, when, as the accompanying table indicates, the approximate domestic production was 320,000 pounds with 1,800,000 pounds imported for consumption. For 10 years, the capacity of the American plants increased rather slowly with an average annual gain of approximately 1,000,000 pounds, but after 1921 the industry began to expand and by 1923 there were six large and well-organized manufacturing corporations with an output in excess of 35,000,000 pounds. By 1925 the annual output had increased from about 15,000,000 pounds in 1921 to almost 52,000,000 pounds during the four year period. In 1926 there was an increase of 12,000,000 pounds followed by a gain of 12,000,000 and 22,000,000 pounds during 1927 and 1928, respectively, or a total gain for three years of 46,000,000 pounds. The 1929 production was estimated at approximately 125,000,000 pounds.

At the biennial census of manufactures in

1928 taken by the U. S. Department of Commerce, the establishments engaged primarily in the production of rayon and allied products in 1927 reported, for that year, a total output

Tennessee, and Virginia, and one each in Connecticut, Delaware, Maryland, New Hampshire, and West Virginia. The statistics for 1927 and 1925 are summarized in the accompanying statement.

RAYON MANUFACTURE IN THE UNITED STATES
(From U. S. Census of Manufactures)

* Not including salaried employees.

^b The amount of manufacturers' profits cannot be calculated from the census figures for the reason that no data are collected in regard to a number of items of expense, such as interest on investment, rent, depreciation, taxes, insurance, and advertising.

^c Not reported separately.

^d Value of products less cost of materials, factory supplies, containers for products, fuel, and purchased power.

valued at \$109,888,336, an increase of 21.8 per cent, as compared with \$88,060,962 for 1925, the preceding census year. The production in 1927 was made up as follows: Yarns, 75,555,439 pounds, valued at \$106,468,752; allied products (sheets, etc.), 2,053,204 pounds, valued at \$3,076,835, and waste, 2,985,390 pounds, valued at \$342,749. This industry classification embraced establishments engaged primarily in the production of rayon yarns and of allied products in the form of sheets, etc., but does not cover establishments manufacturing rayon yarns into finished products, such as textiles. In 1927 there were 19 establishments employing 26,341 wage earners engaged in the production of rayon and allied products, as against 14 establishments and 19,128 wage earners during the previous census year, 1925. The wages paid in the rayon industry in 1927 amounted to \$28,649,441, an increase of 24.7 per cent over 1925, and the cost of materials, factory supplies, containers for products, fuel, and purchased power totaled \$25,747,792, a gain of 39.3 per cent. Of the 19 establishments reporting for 1927, three each were located in New Jersey and New York, two each in Ohio, Pennsylvania,

Additional statistics on rayon production for the United States are given in the accompanying table, also from the *Textile World*, which shows comparative figures with earlier years, as well as the production for 1928 and estimates for 1929. These statistics indicate that the industry was in the hands of large and efficient corporations and the increase in production and capacity since its establishment had been rapid and marked. On the technical side, the leading features of the modern American rayon industry have been the development of yarns of subdued lustre, and the increased production of multifilament rayon. The leading consumers in 1928 were the manufacturers of underwear who were taking practically a third of the country's production. Next came the manufacturers of cotton goods, who used rayon in combination with cotton yarns, accounting for some 20 per cent; the manufacturers of hosiery took a slightly smaller amount, with manufacturers of silk goods in fourth place, other industries absorbing the remainder of the production. The various consumers were calling for improved and finer yarns, and technical advances due to the research chemist and engineer continued.

REA, SAMUEL (1855-1929). American engineer and railroad president (see VOL. XIX). In 1917 the American Railway Association appointed him a member of the special commission on national defense of the Railroads War Board. He was also director of railroads under the authority of the Committee of Public Safety of Pennsylvania. He gave his yacht to the United States government for patrol duty in the Atlantic during the World War. He retired from the presidency of the Pennsylvania Railroad in 1925.

READ, SIR (CHARLES) HERCULES (1857-1929). A British anthropologist (see VOL. XIX). He retained his position as keeper of British and mediæval antiquities and ethnography at the British Museum until 1921 and served as president of the Royal Anthropological Institute and of the Society of Antiquaries of London in 1908-14 and again in 1919-24. He was a fellow of the British and other European academies.

READING. A city of Pennsylvania. The population rose from 96,071 in 1910 to 107,784 in 1920 and to 115,400 in 1928, by estimate of the U. S. Bureau of the Census. Three concrete viaducts have been constructed since 1916; one over the Schuylkill River and the Pennsylvania Railroad tracks at Penn Street; another over Schuylkill Avenue and River Road; and the third, the Landbergh Viaduct, across a deep valley owned by the city as park area. A concrete bridge was also erected over the river at Bingham Street. The school-building programme has included the construction of two junior high schools at a cost of \$1,500,000 and of the new Cosmopolitan High School, which cost \$1,500,000. Additions were made to two hospitals and a third was built. A Y. W. C. A. building and a museum and art gallery have been erected. Since the appointment of a city-planning commission, the electric, gas, water, sewer, and trolley systems have been extended. The number of industrial establishments increased from 386 in 1914, with output valued at \$53,232,000, to 396 in 1927 with output valued at \$102,812,400. Bank clearings in 1928 amounted to \$223,752,000. The assessed valuation of property in 1927 was \$164,269,000; the net debt was \$9,814,000.

READING, RĒD'ING, THE RT. HON. RUFUS DANIEL ISAACS, FIRST MARQUIS OF (1800-). An English jurist (see VOL. XIX), Lord Chief Justice of England from 1913 to 1921. He headed the Anglo-French Loan Mission to the United States (1915), and returned as Special Envoy (1917), and High Commissioner and Special Ambassador (1918-19). From 1921 to 1926, he was Viceroy of India, at the end of his term becoming first Marquis of Reading. After 1926 he was captain of Deal Castle. He was chairman of the board of directors of the *Daily Chronicle*. Consult *Lord Reading*, by C. J. C. Street (1928).

RECLAMATION, LAND. Reclamation of land for agricultural use offers larger opportunity for increasing food production than any other single operation, since throughout the world there are large areas that can be made productive by some one of the processes embraced by this term.

World-wide figures for the areas susceptible of reclamation are not available. The *Year Book of the United States Department of Agriculture* for 1921 gave the area of arid land susceptible of reclamation as 30,000,000 acres, and the area of wet land susceptible of drainage as

90,000,000, making a total of 120,000,000 acres, or an area equaling about 25 per cent of the area of improved land in the United States, or about 33 per cent of the present crop area in the United States. To this can be added a considerable but not definitely known area of land now subject to overflow but capable of reclamation by diking. Probably it is safe to say that the crop production of the United States can be increased at least one-third by land reclamation. In the absence of definite information, it seems probable that the same estimate may be applied safely to the world as a whole. For the United States, the Census of 1920 shows the area actually irrigated in 1919 to be 19,191,716 acres; the area in existing irrigation enterprises 35,890,811 acres; and the area drained in 1920 65,495,038 acres, of which 44,288,238 acres were reported as "improved" land, according to the Census definition.

The United States, about 1850, granted the swamp lands then belonging to the Federal government to the States in which they were situated, in order that the States might provide for their reclamation. As a consequence, the Federal government has not participated in swamp-land reclamation, otherwise than by this grant of land. In the case of irrigation reclamation, the United States government has helped to promote development, first by removing so far as possible the obstacles to development by non-governmental agencies, and later by government financing and construction. In 1902 the Reclamation Law was enacted. This set aside the receipts from the sale of public lands as a reclamation fund to be used in the construction of irrigation works, to be repaid by the water users, replaced in the fund, and used again. As reported by the Census of 1920, the acreage irrigated in 1919 by works built under this law was 18,254,569 acres, or about 6.5 per cent of the total area irrigated in that year. The amount expended under the law at that time was reported as \$129,509,819, which is 18.6 per cent of the total investment in irrigation for the United States. Interest is not charged on deferred payments, which, if added, would make the actual cost to the Government greater than that reported, the remission of interest being, in effect, a subsidy to land reclamation. Only a small part of the money invested in this work by the Government has been repaid, but the receipts from other sources have been added to the reclamation fund, so that the amount available for the year 1923 was about \$10,000,000. The failure of water users to repay construction costs led to the appointment of a commission to investigate and recommend changes in the law or its administration (1923-24). It was felt that the relations between the Government and the water users should be governed by contracts that can and will be carried out, rather than continue under nominal obligations that are ignored.

Drainage reclamation in the United States has taken place almost entirely under State laws for the creation of special improvement districts that have the power to issue bonds to obtain funds for construction, and to levy and collect assessments to meet payments of principal and interest on bonds and operating expenses. These districts are organized under public supervision, but otherwise receive no public aid. The States containing arid land have enacted similar laws for the organization of irrigation districts, and have, in most cases, attempted to aid in the sale

of bonds by certifying such bonds as legal investments for public and trust funds, but they have not assumed any legal liability for the payment of bonds or interest, except in the case of Oregon, where the State pays the interest on the bonds of approved districts for periods of from two to five years. There have been many proposals for extending to drainage reclamation the system of Federal aid in irrigation. On the other hand, there was a growing objection to further subsidy to land reclamation.

For many years in the United States, the rate of expansion in the area of reclaimed land used for agriculture has been decreasing. The average annual increase in the area irrigated from 1900-10 was about 669,000 acres, while the average annual increase from 1910 to 1920 was but 476,000. Annual figures are available for the government projects only. On these, the rate of increase had been falling off sharply, even during the boom years of the War, and the year 1922 showed an actual decrease in acreage as compared with 1921. The decreasing rate of expansion was due, to a large extent, to increased cost of water supply. The Census of 1890 showed an average cost of \$7.95 per acre; that of 1900, \$9.04, that of 1910, \$15.85; and that of 1920, \$26.81. These figures do not represent correctly the increase in cost; this is shown by averages based on the increases in total cost and the increases in total area, from one census to another. Averages based on such figures are as follows; 1890, \$7.95; 1900, \$10.05; 1910, \$20.05; 1920, \$65.60. Comparing these costs with that of 1890, the percentages of increase are 1900, 26.4; 1910, 152.2, 1920, 725.2. In the future, construction will be increasingly difficult and increasingly costly except for general changes in price levels.

Increased food supplies can be obtained in several ways other than by reclaiming lands largely unproductive. This increasing cost of reclamation will tend to force expansion into other lines. Nevertheless, the possibility of expansion by reclamation exists, and such expansion will take place as the pressure of population on food supply becomes more intense. In the United States, the attempt was to make reclamation self-supporting, except for the subsidy represented by relief from interest on deferred payments. Other countries very generally considered reclamation of sufficient importance to justify considerable public subsidies. Italy had provisions for the payment of a part of the cost by the national government, a part by the provinces, a part by those who were to use the water. The British government, in India and Egypt, built and operated reclamation works without provision for direct repayment of cost, but secured its return through taxation of the products grown. In some cases, it was expected that the taxes would pay interest on the cost, such projects being classed as "productive"; while in other cases, such a return is not expected, and the projects are classed as "protective," or "famine" works. In either case, the water users were not under contract to pay any set amount for their water supply, but were to pay according to the products grown. In Australia, however, the state governments have carried on reclamation on the plan adopted in the United States, where the land reclaimed is expected to make a direct repayment of the cost, in addition to being subject to the same taxes as other farm land. Generally, this plan of financing has not

been successful, and investors in reclamation enterprises operating on this basis, whether they were public or private, have lost heavily, while the eventual water users have acquired a water supply at less than cost.

In 1926 Congress passed a readjustment act which practically wiped out some \$25,000,000 then owed. The *Engineering News-Record* (New York), however, attacked the situation as it existed in 1928 on the ground that the abuses which had grown up under the Reclamation Act of 1902 "should be stopped to prevent the further use by private interests of politics as a means of financing nonpaying business enterprises." It remarked, "To the Western Congressman, the reclamation debt is a mere formality; the only thing that counts is that reclamation projects shall be built with government money." The payments back to the fund in 1928 from the communities benefited by irrigation constructions showed considerable improvement, but the general situation is still unsatisfactory.

RECLAMATION BUREAU, UNITED STATES.
See DAMS.

RED CROSS, AMERICAN. The period following the outbreak of the World War brought many opportunities to this volunteer reserve emergency organization to fulfill its purpose of relieving distress in times of peace and war. Its outstanding achievements during this period were naturally those relating to war relief. At the outbreak of the War, the Red Cross had a registered enrollment of 5500 nurses and a large corps of surgeons, besides an equipment for the purchase and transportation of supplies. It was able, therefore, during the latter part of 1914 and through 1915, to send to Europe surgical and sanitary units, each comprising 3 surgeons and 12 nurses, together with the necessary supplies, for war hospital work and the relief of noncombatants, thus rendering greater continuous service than was ever given in a foreign war by any Red Cross of a neutral country. In addition to its services in the War, the Red Cross extended relief in 1915 in Mexico, Colon, Panama, and in Haiti, as well as to sufferers from floods in Texas and Arkansas; and throughout the year 1916 carried on European war relief, to some extent military, but chiefly civil. For this purpose, it received \$700,000 during the year, and in addition, extended relief in Serbia, Lithuania, Armenia, and Syria.

The department of military relief in 1916 did efficient service in the establishment of base hospitals and in rescuing wounded combatants. Important progress was made also in the organization of Red Cross units from the staffs of physicians and nurses in civil hospitals; 21 base hospitals were created for the United States Army, and four others were authorized; while on June 1, a national committee on Red Cross medical service, composed of 47 distinguished American physicians and surgeons, was created.

With the entrance of the United States into the War, increased concentration was required of all the forces of administration and relief; and the entire work was placed on a war basis. A central committee was formed in 1917, with William Howard Taft as chairman, which effected many important changes, the most important being the appointment of a War Council of the Red Cross by President Wilson, with Henry P. Davison, of J. P. Morgan & Co., as chairman. The result of the reorganization was to broaden the scope of the American National

Red Cross so as to include the United States and the Allies. From that time on, work was carried on in two important divisions: the service in America and that in Europe. Immediately after its organization, the council undertook a most successful campaign to raise \$100,000,000 to finance its activities. For relief work in foreign countries, about \$50,000,000 was appropriated; for work in the United States, about \$3,000,000. The membership of the society, which was about 5,000,000 at the beginning of 1917, increased to approximately 22,000,000 at the end of the year. By 1918 the work of the Red Cross had reached a high point of efficiency. In the United States, canteens and rest stations were established and maintained at 700 railroad and embarkation points, at a cost of nearly \$8,000,000. Sanitary conditions around the camps were improved, and emergency supply hospitals were provided; 50 base hospitals were organized, of which 49 were sent to Europe; 45 ambulance companies, with 124 men each, were turned over to the Army; over 32,000 nurses were enrolled, of whom over 20,000 were assigned to war duty with the Army and Navy, and 10,000 were sent overseas. Sixty-three homes for convalescent soldiers were provided.

During the year 1918, nearly \$40,000,000 was spent in France alone, of which \$15,000,000 was spent for relief of soldiers, and the remainder for civilian relief. Eight hospitals for American soldiers only were built, equipped, and operated, besides many others equipped and operated for French civilians. Hospitals were also built and maintained in England, Belgium, and Italy. In Serbia, 50,000 destitute persons were supplied with food, clothing, and medical supplies; much work was done by the Rumanian Commission following the defeat of the Rumanian Army in 1918, nearly \$4,000,000 was contributed to the American committee for Armenian and Syrian relief; a commission was sent to Palestine with four medical units; and arrangements were made for equipping a hospital there. In addition to its war work, the Red Cross continued to give regular disaster-relief work in the United States, China, Guatemala, and elsewhere.

With the conclusion of the War, great readjustments were necessary in the administration of the society. Various foreign commissions were successively closed out, and in May, 1919, a committee of liquidation began to scale down equipment and activities. Late in 1919, however, there were still 1100 Red Cross workers in Europe, and the report of the War Council made in that year disclosed the following record of its activities: contributions received in material and money amounted to \$400,000,000; its members, including adults and children totaled 31,000,000; Red Cross workers, 8,100,000, tons of relief supplies shipped overseas, 101,000, foreign countries in which the Red Cross operated, 25, French hospitals given material aid, 3780; refugees aided in France, 1,726,000. There remained at the beginning of 1919 a balance of \$127,000,000, of which \$41,000,000 was in cash and \$53,000,000 in supplies. Relief work continued during the year in Albania, Belgium, Czechoslovakia, Germany, Italy, North Russia, Poland, Rumania, Serbia, and Siberia and the Red Cross took a leading part in the formation of the League of Red Cross Societies, with headquarters at Geneva. National Red Cross so-

cieties in the United States, Great Britain, France, Italy, and Japan in 1919 inaugurated a world-wide fight for the prevention of disease and the promotion of health.

The outstanding activities during 1920 were the fulfillment of obligations to the veterans of American participation in the World War and to their families, and the completion, as far as it was possible, of relief work among the war-exhausted peoples overseas. At the end of the fiscal year 1920, there were 7,000,000 instances in which help had been extended to men or to their families, involving expenditures of \$20,000,000. Although foreign relief was carried on extensively in all countries in which it operated in 1919, by the end of the year, operations were confined to Poland, Serbia, Montenegro, Albania, Turkey, and southern Russia, the most extensive work being carried on in Poland in a fight against typhus. In western Europe and the Baltic states, 300,000 civilian poor were relieved. Total expenditures for relief during the year amounted to about \$70,000,000.

The following year saw a marked expansion of peace-time activities at home and a contraction of activities in foreign fields, with the result that operating divisions were reduced from 14 to 9. There was increased activity in public health and nursing service and effective disaster relief at home and abroad, with a concentration of effort on child-welfare work, chiefly medical, in foreign countries. In relief work among famine sufferers in China, the Red Cross spent \$1,200,000 and, it is estimated, saved more than 600,000 people from starvation. During 1922, monetary assistance amounting to \$2,500,000 was given to disabled ex-service men and women, \$1,200,000 was expended for medical and hospital supplies for distribution by the American Relief Administration in Russia, \$2,000,000 was devoted to the completion of the child-welfare programme in Europe; and \$2,000,000 to the completion and liquidation of general relief operations abroad.

The outstanding emergency operation of 1923 was the relief work for nearly 900,000 refugees in Greece, comprising those who had been driven out of Asia Minor, for which up to June 30, when the work was closed, \$2,500,000 had been spent. In September of 1923 the Red Cross contributed largely to the relief of Japanese earthquake sufferers, over \$5,000,000 being contributed within 2 weeks and 10 shiploads of supplies being forwarded to Japan. Work continued among the Russian refugees in and around Constantinople and among sufferers from earthquakes in Chile and Persia, as well as among ex-service men, and special attention was given to work in widely scattered rural communities, \$9,738,448 being spent during the year in relief work.

The outstanding domestic disaster of 1924 was the northern Ohio tornado and the Red Cross functioned in relief operations there and in foreign fields among earthquake sufferers in Japan, \$11,922,782 being raised for the latter work. The Society rendered service as a relief agency in 192 disasters of various kinds by the end of its fiscal year in 1924. Contributions for relief were made in 90 disasters in 1925 amounting to \$1,922,782, the outstanding domestic disaster being the great Mid-West tornado of March 17, which required relief measures for approximately 25,000 persons. In 1926 relief was extended in 90 disasters of which 62 were

domestic and 28 foreign, involving expenditures of \$3,924,902; for the assistance of more than 300,000 people.

The fiscal year ending June 30, 1927, was one of unprecedented disasters which called forth the relief agencies of the Red Cross, the average being one disaster in every five days, and two were of unusual violence and magnitude. From mid-September until Christmas, 1926, relief was extended in Florida following the most disastrous hurricane in the history of the United States. Next, the Mississippi flood called forth the Society's relief machinery along a "front" of 1000 miles which extended inland from 50 to 150 miles east and west, and affected 8 states and more than 600,000 persons, who depended upon the Red Cross for their very sustenance. At the same time, assistance also was given in 21 other disasters affecting 12 states, which brought the total number of disasters, in which the Red Cross rendered aid, up to 111 for the fiscal year, 91 of these being in the United States and 20 in foreign lands. In only two of these instances, the Florida hurricane and the Mississippi flood, did the Red Cross make a nation-wide appeal. Total expenditures by national headquarters and Red Cross chapters for disaster relief up to the end of June, 1927, in the United States alone, reached \$8,216,893, in addition to nearly \$20,000,000 which was collected for relief in the case of the two disasters named.

The fiscal year ending June 30, 1927, brought the Red Cross opportunities for rendering service in 88 disasters of major size, of which 66 were in the United States and its insular possessions. A large staff of workers was called forth in the autumn of 1927 to assist flood victims in New England and rehabilitation work in that region was not completed before the summer of 1928. Floods in tributaries of the Mississippi River in the spring of 1928 left 250,000 people homeless and called for an extension of relief work in addition to that being carried on in the Mississippi Valley. Other floods and tornadoes swept through Middle Western States, causing great damage and considerable loss of life. Tornadoes during the year numbered 29, floods, 13, fires, 24, hailstorms, 4; mine explosions, 3, and earthquakes, 4. Monetary relief was given following earthquakes which hit Smyrna, Turkey, Corinth, and Bulgaria, and assistance was given in disasters in Mexico, Jerusalem, Switzerland, Austria, etc. The West Indies hurricane which occurred after the close of the fiscal year made it necessary for the Red Cross to issue a nation-wide appeal for a relief fund and called forth the relief agencies of the society. The total expenditures for disaster relief for the fiscal year ending June 30, 1928, was \$16,544,258.

Other important work of the society during the period 1914-1928 included the establishment of the Life Saving Service which completed 14 years of service in 1928, when enrollment reached 173,506 men, women, and children; volunteer work in chapters in making garments and surgical dressings; first-aid instruction; welfare service; and American Junior Red Cross work, which in 1928 had an enrollment of 6,629,252 children. Senior Red Cross membership on Aug 30, 1928, was 4,058,949. The President of the United States is the president of the society, and national headquarters are at Washington, D. C.

REDFIELD, EDWARD WILLIS (1869-). An American painter (see Vol. XIX). He won the gold medal of the Carnegie Institute in 1914, was on the jury of awards of the Panama-Pacific Exposition in 1915, and won the first prize of the Wilmington (Del.) Society of Fine Arts in 1916, the Carnegie prize from the National Academy of Design in 1918 and 1922, the Altman Prize from the National Academy of Design in 1919, the Stotesbury Prize from the Pennsylvania Academy of Fine Arts in 1920, and the Saltus Medal, National Academy of Design, 1927. One of his pictures, "Sycamore Hill," was in Carnegie Institute.

REDLICH, IATLIK, JOSEPH (1869-). An Austrian legal scholar (see Vol. XIX). A member of the Landtag from 1907 to 1918, he became in October of the latter year Finance Minister in the Lammasch cabinet. In 1926 he was called to a professorship at Harvard University where he had lectured in 1910. His later works include *Das österreichische Staats und Reichsproblem* (2 vols, 1920 and 1926); *Österreichische Regierung und Verwaltung im Weltkrieg* (1925), and *Kaiser Franz Joseph von Österreich* (1928).

REED, DAVID AIKEN (1880-). A United States Senator, who was born at Pittsburgh, Pa., graduated at Princeton (1900), and received the LL.B. degree at the University of Pittsburgh in 1903. In that year, he began the practice of law at Pittsburgh. He was chairman of the Pennsylvania Industrial Accidents Commission in 1912-15. In the World War, he served as major of the 311th Field Artillery, A. E. F., winning the Distinguished Service Medal and membership in the French Legion of Honor. Having resumed law practice at Pittsburgh, in 1922 he was appointed by the Governor of Pennsylvania to fill an unexpired term as United States Senator and in the same year was elected as a Republican for the full term 1923-29. He was reelected in 1928 for the term ending in 1935. In the Senate, he has been chairman of the Committee on Military Affairs and has also been a member of the committees on finance, foreign relations, immigration, and rules. Since 1923 Senator Reed has been a member of the American Battle Monuments Commission.

REED, JAMES A. (1861-). An American legislator (see Vol. XIX), former United States Senator from Missouri. He was first elected for the term beginning Mar. 4, 1911, and was reelected in 1916 and again in 1922. He opposed in the Senate many of President Wilson's policies, including the League of Nations and the Versailles Treaty, and Wilson in effect repudiated him as a member of the party. He was a candidate for the Democratic nomination for the Presidency in the early part of 1924, but withdrew following his defeat in the Missouri primaries in March. He failed of renomination for the Senate in 1928.

REED COLLEGE. A coeducational institution of higher learning at Portland, Oregon, founded in 1911. The enrollment increased from 280 in 1916 to 353 in 1928, the faculty during the same period from 21 to 35 members, and the library from 12,000 to about 40,000 volumes. In 1928 productive funds amounted to \$1,750,336.15 and annual income to \$96,443.39. Various changes were made in the requirements for admission and the curriculum of the freshman and sophomore years was reorganized in 1921. The Mann cottage for women was built in 1920 and the Commons-Union was

completed in 1923. Norman Frank Coleman, I.L.D., succeeded the late Richard Frederick Scholz as president in 1925.

REESE, ALBERT MOORE (1872-). An American zoölogist, born at Lake Roland, Md., and educated at the Johns Hopkins University. He was professor of biology at Allegheny College (1901-02); instructor (1902-03) and associate professor (1903-07) at Syracuse University; and professor of zoölogy (1907-) at the University of West Virginia. He published numerous papers on the habits and embryology of the American alligator and *Introduction to Vertebrate Embryology* (1910); *The Alligator and its Allies* (1915); *Outline of Economic Zoology* (1919); and *Wanderings in the Orient* (1919).

REFORMED CHURCH IN AMERICA.

Composed originally of settlers from Holland and known until 1867 as the Reformed Protestant Dutch Church in North America, the denomination has since become largely intermixed with elements from many other nationalities. It adheres to the doctrines of the Belgic Confession and the Heidelberg Catechism, in 1837 it indorsed the Westminster Catechism. The form of government is of the Presbyterian type, with four classes of officers—ministers, teachers (or professors), elders, and deacons. Administratively, the church is divided into consistories, classes, provincial synods, and the General Synod, the latter operating through a board of direction. In 1929 the Reformed Church in America reported 739 churches, 846 ministers, 87,132 families, 159,662 communicants, and approximately 200 foreign and 200 domestic missionaries. For 1915 the comparative figures were 718 churches, 750 ministers, 71,000 families, 127,000 communicants, and more than 100 foreign missionaries. The church in 1929 was maintaining foreign missions in Japan, China, India, Arabia, and Mesopotamia, the latter jointly with the Presbyterian Church of the United States and the Reformed Church in the United States.

The value of property used for purposes of worship was placed at more than \$38,000,000 in the Federal religious census of 1926. The church maintains seminaries at New Brunswick, N. J., and Holland, Mich., and also Hope College, Holland, Mich., and (since 1916) Central College, Pella, Iowa, formerly under Baptist auspices. Schools are conducted for Indians in Oklahoma and New Mexico, for the mountain people of Jackson County, Ky., and for Negroes at Brewton, Ala. Rutgers University, at New Brunswick, N. J., is historically affiliated with the denomination, although entirely independent of ecclesiastical control. In 1917 the church assumed control of the denominational periodical, the *Christian Intelligencer*. A 5-year programme called the Progress Campaign was initiated in 1918, resulting in the formation of the Progress Council in 1923. Benevolent giving doubled in the years 1918-21 as a result of this movement and has since made further gains. In addition to the synods of New York, Albany, New Brunswick, and Chicago, a fifth, the Particular Synod of Iowa, was formed in 1919 as a result of the growth of the denomination in the Middle West and three new missionary stations were established in Mesopotamia after the World War. Ferris Seminary at Yokohama, Japan, was destroyed by the earthquake of September, 1923, but was replaced by a new building dedicated in 1929.

In 1928 the denomination celebrated the 300th anniversary of the arrival in America of its first minister, the Rev. Jonas Michaelius. The ceremonies were held in the Church of Saint Nicholas, New York City, in June. A \$1,000,000 endowment fund for ministerial pensions was raised in connection with the celebration. The Rev. Dr. Daniel A. Poling, pastor of the Marble Collegiate Church, New York City, was elected president of the session of the General Synod in June, 1929. Consult Brown, *History of the Reformed Church in America* (1928); Demarest, *Tercentenary Studies* (1928); Romig, *The Tercentenary Year* (1929); Corwin, *Manual of the Reformed Church in America* (5th ed., 1922).

REFORMED CHURCH IN THE UNITED STATES (GERMAN REFORMED).

A Protestant denomination, founded by early German immigrants to the United States from the Rhine provinces and Switzerland, which accepts the Heidelberg Catechism as both a confession of faith and book of instruction. The government is presbyterial in form and both liturgical and free services are authorized. According to the Federal Census of 1926, the denomination in that year had 1709 churches and 361,257 members, as compared with 1758 churches and 344,374 members in 1916. More than half of the churches and about two-thirds of the total membership were in Pennsylvania in 1926. In that year, 1692 churches reported total expenditures of \$7,488,446 including \$1,817,921 for benevolences, missions, etc., as compared with total expenditures of \$3,247,773 by 1714 churches in 1916. The value of church edifices, including equipment, increased from \$20,116,336 in 1916 to \$44,662,875 in 1926. Figures for Sunday-school attendance were 1926, 29,339 teachers and 315,353 pupils; 1916, 29,389 teachers and 304,350 pupils. Administratively, the churches are grouped in 7 district synods and 58 synods. The General Synod meets triennially. The denomination supports three theological seminaries and nine colleges. The seminaries are the Central Theological Seminary, Dayton, Ohio; Mission House Theological Seminary and College Academy, Plymouth, Wis.; and the Theological Seminary at Lancaster, Pa. The colleges are Catawba College, Newton, N. C.; College for Women, Allentown, Pa.; Franklin and Marshall College, Lancaster, Pa.; Heidelberg University, Tiffin, Ohio; Hood College, Frederick, Md.; Franklin and Marshall Academy, Lancaster, Pa.; Massanutten Academy, Woodstock, Va.; Mercersburg Academy, Mercersburg, Pa.; Ursinus College, Collegeville, Pa. Denominational publications in English are *Reformed Church Messenger*, *Christian World*, *Reformed Church Record*, *Way*, *Leaves of Light*, *Sunshine* (all weeklies), *Reformed Church Review* (quarterly), *Reformed Church Standard* (semi-weekly), and *Heidelberg Teacher* (monthly), in German, two weeklies.

REFORMED EPISCOPAL CHURCH. Intense discussion in the Protestant Episcopal Church in 1873 culminated in the withdrawal of many clergymen and laymen under the leadership of Bishop David Cummins, and the organization of the Reformed Episcopal Church. In policy and doctrine, it accords with the Protestant Episcopal Church, except that it looks upon the episcopacy as an ancient and desirable form of church government, rather than as of divine right, denies that Christian ministers are "priests," does not demand the reordination of clergymen of other denominations who enter its ranks, does not organize its

bishops in a separate house in the General Convention, and denies baptismal regeneration. The Convention, which meets triennially, is the governing body of the church, comprising two synods in the United States, one in Canada, and three missionary jurisdictions. Meetings were held at Philadelphia, Pa., in May, 1924, and May, 1927. Membership in the church increased from 10,800 in 1913 to 13,750 in 1922, and to 25,300 in 1928, churches, from 81 to 86, between 1913 and 1928, ministers, from 83 to 91, and Sunday-school pupils, from 9496 in 1918 to 26,000 in 1928. The denomination continued its home missionary work among Negroes in the South, and its foreign work in India. The church maintains a theological seminary in Philadelphia, and publishes a periodical, the *Episcopal Recorder*. Headquarters of the General Council are at 1617 Oxford Street, Philadelphia.

RÉGNIER, rā'nyā', HENRI FRANÇOIS JOSEPH DE (1864-). A French author (see VOL. XIX) and member of the Academy. His later works include *L'allusion héroïque de Tito Bassi* (1916); *Les vacances d'un jeune homme sage* (1917); *1914-16-Poésies* (1918); *Histoires incertaines*, short stories (1919); *Vestigia flammæ*, poems (1921); *Romanic Mirmault* (1922); *Les rencontres de Monsieur de Bréot* (1922); *Les bonheurs perdus* (1924); *Le divertissement provincial* (1925); *Proses datées*, essays (1925); *L'escapade* (1926); and *L'al-lana, ou La vie rétrospective 1899-1924* (2 vols., 1928). He also edited *Le roman littéraire* (11 vols., 1917-25).

RÉGNIER, MARIE LOUISE ANTOINETTE (1875-). A French writer, born in Paris, who used the pseudonym of Gérard d'Houville. She is the daughter of José Maria de Hérédia, and the wife of Henri de Régnier. Besides her contributions to papers such as *Revue des Deux Mondes*, *Le Temps*, *Figaro*, and *Le Gaulois*, her writings include *L'inconstante*; *Esclave*, *Le Temps d'aimer*; *Le Séducteur* (1914); *Tant pis pour toi* (1921); *L'Enfant* (1925); *La Vie amoureuse de l'impératrice Joséphine* (1925); *Chez le magicien* (1927); and *La Vie amoureuse de la belle Hélène* (1928). She also wrote poems, the dramatic proverbs *Il faut toujours compter sur l'imprévu* (1916); *La nuit porte conseil* (1917); *On ne saurait penser à tout* (1920); *Il ne faut pas dire: fontaine* (1927); and *Je crois que je vous aime*, seven short plays (1927). In 1925 she edited *Fables et Farfeluches*.

REGULAR ARMY, UNITED STATES. See ARMIES AND ARMY ORGANIZATION.

REHBOCK, THEODORE (1864-). A German engineer, specializing in river and harbor developments. Born in Amsterdam and trained in the technical schools of Munich and Berlin, he became a professor of engineering in Karlsruhe Technical School and supervised important engineering projects in North and South America and South Africa. In March, 1929, he lectured at the Massachusetts Institute of Technology and afterwards visited American and Canadian water power developments.

REID, E. EMMET (1872-). An American chemist, born at Fincastle, Va., and educated at Richmond College and at Johns Hopkins. He was professor of chemistry at the College of Charleston, S. C. (1898-1901), at Baylor University, Waco, Tex. (1901-08), and at Johns Hopkins (1914-). During the World War. he was associated in gas warfare investigations under the U. S. Bureau of Mines. His original investigations relate to such subjects as hydrolysis and alcoholysis of acid amines; thio acids and alcohols and their esterification; organic sulphur compounds; and organic catalysis. Besides many papers contributed to the *American Chemical Journal* and similar publications, he published a translation of Sabatier's *Catalysis in Organic Chemistry* (1921) and is the author of *Introduction to Research in Organic Chemistry* (1924).

REIMANN, HANS (1889-). A German satirist and caricaturist, born in Leipzig. His works include *Die Dame mit den schönen Beinen* (1916); *Kobolz* (1917); the autobiographical novel, *Tyll* (1918); *Sächsische Miniaturen* (1922); *Von Karl Man bis Pallenberg* (1923); *Der Geinig* (1923); *Der Komponist wider Willen* (1928). Since 1924 he has edited the satirical periodical, *Das Stachelschwein*.

REIMS. See WORLD WAR, *Western Front*.

REINER, FRITZ (1888-). A Hungarian conductor, born at Budapest. He studied under Thomann and Kossler at the Landesmusikakademie there and in 1900 became conductor at the Comic Opera. In 1910 he was first conductor at the Landestheater in Laibach and in the following year at the Volksoper in Budapest. His appointment as principal conductor at the Hofoper in Dresden, as Schuch's successor (1914), offered him the opportunity for the full development of his exceptional powers, so that in a short time, he was in great demand as a guest-conductor and appeared also in Spain and Italy. In 1922 he became Ysaÿe's successor as conductor of the Cincinnati Symphony Orchestra. In recent years, he appeared frequently as guest-conductor of several of the great American symphony orchestras. His wife, Berta Gardini, a daughter of the celebrated Etelka Gerster-Gardini, is a concert-singer.

REINHARDT, rin'hart, MAX (1873-). A German theatrical director and manager (see Vol. XIX). In 1919 he founded the Grosses Schauspielhaus, a theatre as large as the New York Hippodrome, specializing in impressionistic mass effects. As a master of the new stagecraft, Reinhardt toured the United States in 1923. He presented *The Miracle*, one of the largest theatrical pageant spectacles ever produced, in New York City under Morris Gest's management. Since 1924 he has directed the Theater in der Josefstadt in Vienna and produced the *Festspiele* in Salzburg, which has attracted many foreign visitors each summer.

REISS, ris, ALBERT (1870-). A German dramatic tenor, born in Berlin. He had begun a successful career as an actor when Pollini discovered his voice and persuaded him to study for the operatic stage. He made his début in Lortzing's *Zar und Zimmermann* at the Stadttheater in Königsberg (1897). He then sang at Posen, Wiesbaden, and Munich. In 1901-17 he was a member of the Metropolitan Opera Company, with which he became especially identified with the rôles of David (*Meistersinger*) and Mime (*Siegfried*). He also created there

the principal tenor parts in the world premières of Puccini's *Fanciulla del West* (1910); Humpendink's *Königskinder* (1910); Parker's *Mona* (1912); Damrosch's *Cyranos de Bergerac* (1913); De Koven's *Canterbury Pilgrims* (1917); and in the American première of Smetana's *Bartered Bride* (1909). In 1916 he organized the Society of American Singers for the purpose of producing in English the more intimate operas which lose much of their effectiveness in a large auditorium. He staged the American première of Mozart's *Schauspieldirektor* (October 26) during its first season in New York, in the following year, Pergolesi's *La Serva padrona* (May 7), Donizetti's *Il Campanello di Notte* (May 7), and Gounod's *Le Docteur Miracle* (May 10) had their American premières. He resigned in 1918 and was succeeded by William Hinshaw (q.v.).

REJUVENATION. See SECRETIONS, INTERNAL.

RELANDER, LAURI KRISTIAN (1883-). A President of Finland, born at Kurkijoki. Educated at the University of Helsingfors, where he received the degree of M.A. and Ph.D. in agriculture, he became a member of the central committee of the Agrarian Party in 1909 and represented that party in parliament in 1910-13 and 1917-19. He was chairman of the Education Committee of the Diet, Speaker of parliament (1919) and Governor of the administrative district of Viipuri (1920-25). In the latter year he was elected President of the Finnish republic.

RELIEF ADMINISTRATION, AMERICAN. An organization built up by Herbert Hoover shortly after the Armistice as an agency to administer American relief to the countries of Europe that were devastated by the War. The A. R. A. was set up by an act of Congress and approved by President Wilson on Feb. 24, 1919. In his capacity of director general of relief for the Allies and as member of the Supreme Economic Council, Mr. Hoover coordinated the Inter-Allied efforts for relief and economic reconstruction. Food valued at approximately \$400,000,000 was supplied to European countries in central Europe for gold or negotiable securities. For additional supplies which were necessary, but for which the governments concerned were unable to pay cash, the American government accepted obligations amounting to \$300,000,000. A further \$30,000,000 was spent by the A. R. A. during this period for the relief work among children. The general relief operation under the congressional appropriation of \$100,000,000 was completed in the autumn of 1919, but the care of children in the Baltic and central European countries was continued by the A. R. A. Relief measures for the year 1919-20 amounted to a cost of \$100,000,000, of which \$50,000,000 came from Congress. American supplies began to reach Europe early in 1919 and were distributed by the A. R. A. in Finland, Estonia, Latvia, Russia, Lithuania, Poland, Danzig, Germany, Czechoslovakia, Austria, Hungary, Rumania, Yugoslavia, Armenia, Georgia, and Bulgaria. Supplementing the general relief programme was the work among children carried on by the A. R. A. European Children's Fund.

The A. R. A. also helped wage war on typhus in Poland and Rumania and devised a money-exchange system to facilitate the sending of aid from residents in America to friends and relatives in the stricken European countries. In

1920 the A. R. A. joined with other American relief agencies in a national appeal for funds for the support of European children; this resulted in the collection of \$29,000,000. In the year 1920-21 alone, the A. R. A.'s work among children reached \$3,500,000. In 1921 the A. R. A. answered the appeal of Soviet Russia, then in the midst of a famine. Beginning with a programme for the feeding of one million children, its work reached its peak in August, 1922, when nearly 11,000,000 children and adults were receiving daily rations. The A. R. A. also carried on in Russia a vast medical-relief programme which included the rehabilitation of 15,000 hospitals and institutions, and a general campaign of sanitation in the principal cities and towns. The A. R. A. in Russia operated some 20,000 feeding stations with an American staff of 200 and a Russian staff of 150,000 persons. The funds for the Russian relief were approximately \$65,000,000, of which \$24,000,000 was appropriated by the United States Congress; \$12,000,000 came from the Russian Soviet government; \$3,000,000, from the American Red Cross; \$4,000,000, from the Jewish Joint Distribution Committee; and the remainder from gifts made directly to the A. R. A. The arrival of American supplies checked the famine in Russia in the early summer of 1922, and by the autumn of that year work among adults could be discontinued. The organization nevertheless continued its activities on behalf of the Russian children until the summer of 1923. All European offices of the A. R. A. were closed and all personnel withdrawn in the autumn of 1923. The totals of supplies handled from all quarters exceeded one billion dollars. Relief was provided at one time or another to 200,000,000 persons, while direct services were rendered to more than 11,000,000 orphan and destitute children.

Officers of the American Relief Administration at the end of its European operations were: Herbert Hoover, chairman; Julius H. Barnes, vice chairman; Edgar Rickard, director general; Edward M. Flesh, comptroller; Gates W. McGarrah, treasurer; George Barr Baker, director of State organizations, Walter Lyman Brown, director for Europe, Col. William N. Haskell, director in Russia.

RELIEF IN BELGIUM, COMMISSION FOR. See BELGIUM.

RELIGION, PRIMITIVE. See ETHNOLOGY.

RELIGIOUS CONTROVERSIES. The period from 1914 to 1929, and especially the interval following the World War, was marked by a remarkable revival of religious controversies in several of the larger Protestant denominations. Those chiefly affected were the Baptist, Methodist, Presbyterian, and Protestant Episcopal. In the main, these dissensions centred about the old differences between liberal and conservative interpretations of the Scriptures and creeds, but this so-called fundamentalist-modernist dispute was clearly on the wane by 1927 and other sources of controversy presented themselves in the growing movement toward Protestant unity and the increased activity displayed by some of the denominations in support of prohibition and in other political questions.

The differences over Scriptural and creedal interpretations corresponded to a large extent to the struggle against modernism which for many years was carried on in the Roman Catholic Church. In connection with them, there emerged a new

term, fundamentalism. Although this was applied especially to the controversy between the liberal and conservative elements in the Baptist denomination, it also described essentially the character of the disagreements in the other denominations. Fundamentalism is defined by one of its adherents as "merely an uprising of orthodox supernaturalism against modern naturalism." Those opposed to fundamentalism describe it as a movement among ultraconservatives to keep religion in the bonds of supernaturalism.

It is generally admitted that the conditions which followed the World War were largely responsible for the revival and development of this struggle between the liberal and conservative wings. Fundamentalism, however, was more than a reaction. It was the culminating point of a tendency which had been gathering strength for at least 30 years. The controversy in its widest sense turned on the view held in regard to the Scriptures. The fundamentalists or conservatives assumed an inerrant Bible, literally inspired and authoritative throughout, the virgin birth and deity of Christ, the literal resurrection of the body, the atoning sacrifice of Christ's death for the sins of the world, and His second coming in bodily form, and they viewed as inimical to Christian doctrines any theory or interpretation which contradicted the literal interpretation of the Scriptures. Thus, they came into conflict with the doctrine of evolution or Darwinism. The controversy first began among the Baptists and after 1920 spread to the Presbyterians, Methodists, and Protestant Episcopalians. Strong attacks were delivered, not only in the pulpit, but in the schools, against the teaching of the theory of evolution. Indeed, in several States, commencing in 1922, the Legislatures adopted resolutions prohibiting the teaching of evolution in the school system. Among the most ardent opponents of the evolution theory was W. J. Bryan, who devoted much of his time to attacking the doctrine on the platform and elsewhere.

In the Baptist denomination, where the controversy was especially fierce, it was estimated by Dr. Shailer Mathews of the University of Chicago in 1923 that the fundamentalists in that year controlled about one-fourth of the evangelical churches in the East, about half the evangelical churches in the Middle West and South, and about three-fourths of the evangelical churches in the Far West. The fundamentalists themselves claimed in that year to control nine-tenths of the laity of the churches. The fierceness of the controversy within the denomination subsided after 1924 and there was a gradual swing toward liberalism. The subject did not disturb the annual conventions of either Northern or Southern Baptists in 1928 and 1929, although kept in the background with difficulty at times. At the Northern Baptist Convention in 1929, conservatives temporarily blocked a proposal for immediate cooperation and ultimate union with the Disciples of Christ and raised objections to the participation of the denomination in the work of the Federal Council of Churches of Christ in America, the leadership of which, in general, has been liberal. The latter question assumed increasing importance in other denominations also as the Federal Council expanded its influence and activities.

In the Presbyterian denomination, the struggle took on great intensity from 1922 to 1924. *The Presbyterian*, conservative church organ, declared: "Rationalism and Evangelicism are an-

tagonists that can never be reconciled; it is vain to try to plaster up a union between them." Prof. J. Gresham Machen of the Princeton Theological Seminary, a fundamentalist leader, stated that "modern liberalism is not only a different religion from Christianity but belongs to a totally different group of religions." In New York City, a particularly bitter controversy arose over the preaching of Dr. Harry Emerson Fosdick, a Baptist clergyman, at the First Presbyterian Church. He was one of the chief advocates of liberalism, and efforts were made at various times to prevent his occupying a Presbyterian pulpit. The struggle between liberals and conservatives for the control of the Princeton Theological Seminary prolonged the fundamentalist-modernist controversy in the denomination and it was still a live issue in 1929. In that year, the liberals won a victory at the General Assembly of the Presbyterian Church in United States of America in St. Paul by the election of Dr. Cleland B. McAfee as moderator and the subsequent merging of opposing boards of directors and trustees of the Princeton Seminary into a liberal board of control. Fundamentalist professors at the seminary, headed by Dr. Machen, and their sympathizers immediately announced plans for the establishment of a rival seminary in Philadelphia. The new institution, known as Westminster Theological Seminary, was formally opened in Philadelphia Sept. 25, 1929, with 50 students, 20 of whom were former students at the Princeton Seminary. The opening was heralded as "the beginning of a great movement to resist, and, if possible, overcome, the tendency toward Modernism." Other controversies within the denomination centered in the proposal to restrict the grounds for divorce solely to adultery, the demand that women be admitted to the ministry, and the powerful movement for union with the 13 branches of the denomination and with the Methodist Episcopal and Reformed churches.

In the Protestant Episcopal Church, the controversy turned on the interpretation of certain doctrines, especially the Virgin Birth and the bodily resurrection of Christ. In November, 1923, at a special session of the bishops of the church held in Dallas, Texas, a pastoral letter was drafted in which the declaration was made that to deny or to suggest errors as to the facts stated in the Apostles' Creed was irreconcilable with oaths taken by ministers of the church, and that objections to the Virgin Birth and the bodily resurrection are contrary to the best traditions and that these doctrines are abundantly proved by scholarship. This letter was appointed to be read in all the churches. It at once aroused opposition and hostility among the advocates of liberalism. A number of clergymen, including the Rev. Dr. Percy Stickney Grant, of New York City, and the Rev. Lee W. Heaton, of Fort Worth, Tex., publicly affirmed their disbelief in the Virgin Birth. A resulting controversy between Bishop William T. Manning of the Diocese of New York and Dr. Grant led to the latter's resignation.

The struggle between liberals and conservatives, or between the low and high church wings of the denomination, was still active in 1929, particularly in the Diocese of New York. A feature of the period was the development of a strong Anglo-Catholic movement, which opposed liberal efforts toward Christian unity in general and specifically the proposed union of the Protestant Episcopal, Methodist Episcopal, and Presbyterian

denominations. Repercussions of the Anglican Prayer Book dispute were evidenced in the controversy over the proposed elimination of the so-called Thirty-nine Articles of Faith from the Protestant Episcopal Book of Common Prayer. The articles repudiated Roman Catholic doctrines and ceremonies. Their elimination was approved after some controversy at the triennial convention of the church in 1925, subject to ratification at the 1928 convention. In the latter year, a formal protest by 105 low-church leaders and a petition, signed by 30,000 communicants, opposing the proposed revision, induced the House of Bishops to table the matter indefinitely. The convention also disposed of other controversial issues by delaying revision of the canons on marriage and divorce for three years, rejecting a proposal to forbid the discussion of politics in the pulpit, and giving official sanction to faith healing.

Fundamentalism was an issue at the quadrennial general conference of the Methodist Episcopal Church in 1924. An attempt to pass a so-called Declaration of Faith presented by fundamentalists was defeated, although the majority of the delegates opposed modernism. Another attempt to inject the issue into the 1928 quadrennial conference, through heresy charges filed against Bishop Francis J. McConnell, an outstanding liberal leader, was overwhelmingly defeated. As in the other denominations, there was considerable opposition to the vigorous movement toward Protestant unity. Union of the Northern and Southern branches of the denomination was rejected by vote of the Methodist Episcopal Church, South, in 1925. The Northern branch at its 1928 conference voted 852 to 3 to inaugurate overtures looking to early organic union with like-minded denominations, namely, the Presbyterian and Congregational. The activities of the Methodist Board of Temperance, Prohibition, and Morals at Washington and those of Bishop James Cannon, Jr., of the Methodist Episcopal Church, South, and other denominational leaders during the presidential campaign of 1928 provoked severe criticism both within and without the denomination. Opposing Bishop Cannon were Bishop Warren A. Candler, senior Bishop of the Methodist Episcopal Church, South, and Dr. John A. Mell, president of the Georgia Baptist Convention, who publicly protested against the participation of the church as such in politics.

The Universalists in 1929 were facing a split between a section of the denomination desiring union with the Congregationalists and a section favoring union with the Unitarians.

Evidence of the lessening of the controversial spirit in the Protestant world was seen in the fact that, in the United States in 1929, nine leading denominations were conducting negotiations for organic union with one or more others. Even greater headway was made during the period in countries under the British flag. Important mergers took place in Canada, where the Methodist, Congregational, and most of the Presbyterian churches united in 1925 (see CANADA, UNITED CHURCH OF); in Great Britain, where three branches of Methodism combined in 1928, and in Scotland, where the Presbyterians of the Church of Scotland and the United Free Church were reunited in 1928. In the Anglican communion, bitter dissensions developed. See ENGLAND, CHURCH OF.

The century-old Catholic-Protestant controversy was fanned anew toward the close of the period 1914-29 by the religious situation in

Mexico, the encyclical on "The Promotion of True Religious Unity," issued by Pope Pius XI in 1928, the candidacy of Alfred E. Smith, a Roman Catholic, for President of the United States in 1928, and the conclusion of the treaty in 1929 between Italy and the Vatican. The controversy as to the eligibility of a Roman Catholic for the Presidency of the United States was inaugurated through an exchange of letters between Charles C. Marshall, a New York lawyer, and Governor Smith. This discussion was on a high plane, from which those which followed during the heat of the campaign frequently descended.

Religious controversies between Moslems and Hindus in India continued to be marked by bloody riots and a dispute between Jews and Moslems over the ancient Wailing Wall in Jerusalem precipitated rioting throughout Palestine in 1929 in which several hundred persons were killed or injured.

RELIGIOUS DENOMINATIONS. See articles on the respective denominations.

REMINGTON, WILLIAM PROCTER (1879-). An American Protestant Episcopal bishop, born at Philadelphia, and educated at the University of Pennsylvania and the Theological Seminary of Virginia. He was ordained in the following year and was a curate and rector of several churches in Philadelphia until 1911, when he became rector of St. Paul's Church, Minneapolis, Minn. In 1918 he was consecrated Suffragan Bishop of South Dakota and served as chaplain in France during the World War. In 1922 he was elected bishop of Eastern Oregon.

RENSSELAER POLYTECHNIC INSTITUTE. A school of engineering and science, at Troy, N. Y., established in 1824, offering graduate and undergraduate courses in civil, mechanical, electrical and chemical engineering and in general science. Four courses were added in 1925, in business administration, in physics, in chemistry, and in pre-medical work. The Institute expanded during the period between 1914 and 1928 both in numbers and equipment. The registration in the latter year was 1426 compared with 640 in 1914, the faculty numbered 115 as compared with 63 in the earlier year, and productive funds increased from \$1,350,000 to \$4,500,000. The library in 1928 contained 18,355 volumes and 19,963 pamphlets. In 1922 a great broadcasting station was established which claimed the record for long distance, transmission from it having been heard a distance of 10,000 miles. A gauging station to be used by the students under the direction of the United States Geological Survey was established in 1923. In 1914 the property of the institute was valued at \$2,850,000; in 1928 the value was more than \$10,000,000. A new library with an auditorium, Amos Eaton Hall, was dedicated in 1928. It was built at a total cost of \$320,000. The Caldwell Dormitory was opened in 1927. President, Palmer C. Ricketts, E.D., LL.D.

REPARATIONS. The subject of reparation by Germany and her allies for damages done to the Allied countries during the World War constituted one of the most difficult and compli-

cated of the multifarious problems considered at the Peace Conference of Paris in 1919. Only tentatively and unsatisfactorily dealt with at that time, it subsequently remained the key factor in the economic rehabilitation of Europe and a perennially potent menace to international peace and security. Inveterate international practice had consecrated the right of the victor to recover, if possible, the costs of war from his defeated enemy; the classic example of an indemnity was the \$1,000,000,000 penalty imposed by the German allies on France at the conclusion of the Franco-Prussian War (1870-71). *Vae victis!* The first formal though secret reference known to have been made to this subject by the Allied governments during the World War was in the Treaty of London (Apr. 26, 1915), which promised Italy, besides many other things, "a share of the war indemnity." In their pronouncement of Dec. 30, 1916, the Allied governments asserted: "The disasters caused by the German declaration of war and the innumerable outrages committed by Germany and her allies against both belligerents and neutrals, demand penalties, reparations, and guarantees." In their note to President Wilson, Jan. 10, 1917, they explained that their war-aims, "with all the compensation and equitable indemnities for harm suffered," would only be set out in detail when the time came for actual negotiations, although they avowedly included "necessarily and first of all, the restoration of Belgium, Serbia, and Montenegro, with the compensation due to them," and the "evacuation of the invaded territories in France, in Russia, and in Rumania, with just reparation."

In his war-aims address of Jan. 5, 1918, Lloyd George reiterated these objects, declaring that the British government and the Allies demanded the "complete restoration . . . of the independence of Belgium and such reparations as can be made for the devastation of its towns and provinces. This is no demand for war indemnity as was imposed on France by Germany in 1871. *It is not an attempt to shift the the cost of warlike operations from one belligerent to another, which may or may not be defensible . . .* Next comes the restoration of Serbia, Montenegro, and the occupied parts of France, Italy, and Rumania. . . Finally, there must be reparation for injuries done in violation of international laws"

This clear-cut pronouncement, so remarkable in the light of the speaker's subsequent vagaries, promptly elicited (January 6) a telegram from Premier Clémenceau congratulating him for having so felicitously summarized "the actual truths." The same specific aims were later incorporated by President Wilson in his famous "Fourteen Points" address of Jan. 8, 1918 (Points 7, 8, and 11). The President, however, made no reference to indemnities for war costs, and his conception of reparations for damage done, as therein expressed, was distinctly limited in scope. Indeed, in his "Four Principles" address of Feb. 11, 1918, Wilson categorically asserted "*There shall be no annexations, no contributions, no punitive damages*" On Dec. 4, 1917, he had explained to Congress that "the wrongs, the very deep wrongs, committed in this war, will have to be righted. . . . But they cannot and must not be righted by the commission of similar wrongs against Germany and her allies." This principle and purpose he reiterated on Sept. 27, 1918, in the much-quoted sentence that "the impartial justice meted out

must involve no discrimination between those to whom we wish to be just and those to whom we do not wish to be just."

The Armistice terminating the War was avowedly predicated on the acceptance both by the Entente Powers and by Germany of the principles enunciated by Wilson in his successive addresses of 1918. The Peace Conference was to discuss the practical details of their application. To be sure, one of the reservations made by the Supreme Council (Nov. 4, 1918) was to the effect that provision for the evacuation and restoration of all invaded territories expressly implied that compensation would be made by Germany "for all damage due to the civilian population of the Allies and their property by the aggression of Germany by land, by sea, and from the air," but the exact force and extent of the obligations created by these conversations were rendered lamentably obscure by a qualifying clause in Article 19 of the Armistice Convention itself, suggested by M. Klotz, French Minister for Finance, stipulating that subsequent financial demands and claims by the Allies and the United States should remain unaffected. Around the interpretation of these conditions, a diplomatic and legal battle was destined to rage. Interestingly enough, Lloyd George insisted (Nov. 3, 1918) that nothing should be put into the Armistice terms that would lead Germany to suppose that the Allied Powers wanted a war indemnity.

With the emotional reaction of the post-Armistice period came a significant realignment of facts and forces. As the extent of Germany's collapse came to be known, greater demands were made for her condign punishment. In the parliamentary election of Dec. 14, 1918, in Great Britain, Lloyd George's coalition government catered to the popular demand for a retributive peace by promising to recover the whole cost of the War, "shilling for shilling" and "ton for ton." Lord Cunliffe, ex-Governor of the Bank of England, estimated Germany's liability to pay as aggregating the stupendous sum of \$100,000,000,000, a total which the Premier very shortly afterward augmented to \$120,000,000,000. In France, the Clémenceau cabinet and the overwhelming majority of the French people were formulating equally extreme demands. The imposition of taxes was postponed in response to popular claims, and by skillful propaganda the masses were convinced that Germany could, should, and would be made to pay the full costs of the War.

On Jan. 25, 1919, at the second plenary session of the Peace Conference, a commission was appointed to examine and report, first, on the amount which the enemy countries ought to pay by way of reparation; secondly, on what they were capable of paying; and thirdly, on the method, form, and time in which payment should be made. Two main controversies marked the discussions of the ensuing months: (1) that over permissible categories of damage; and (2) that over Germany's real or alleged capacity to pay. Of the 31 categories suggested to the Commission, 10 were ultimately incorporated in the Treaty of Versailles. It was universally agreed that direct damage to persons or property should be compensated, and certain other claims occasioned little conflict, but not so with war costs.

Mr. Hughes and Lord Sumner of the British delegation bluntly argued that since ultimately all war costs had to be met by general taxation, they constituted damage done to civilian

populations in the Allied countries and might therefore be legitimately included in the reparations bill. This view received the keen support of the French, whose interest in reparations was subordinate only to their primary consideration of security. (See PEACE CONFERENCE AND TREATIES.) So fearful were they of a German revival, so completely exasperated and antagonized by the systematic and intentional destruction of their industrial regions that they proved even more determined than the British to cripple Germany economically. Consequently, they favored assessing the entire cost of the War on the vanquished foe despite the fact that although the absolute amount of their claim might be substantially increased thereby, their relative share in the total receipts would nevertheless be greatly diminished. The Belgians, anxious for complete indemnification and priority of payment, expressed serious concern lest the extension of Allied claims far beyond the finite capacity of Germany to pay would eventually deprive Belgium of her due. The Americans, renouncing any claims for themselves, attacked the inclusion of war costs as violating pre-Armistice pledges. The dispute was referred to the Supreme Council on March 1, and the refusal of the American experts to accede to the British and French demand was subsequently upheld by President Wilson, who denounced the course contemplated and declared that he would "dissent publicly, if necessary, not on the ground of the intrinsic injustice of it, but on the ground that it is clearly inconsistent with what we deliberately led the enemy to expect and cannot now honorably alter simply because we have the power."

This rejection of their original demand impelled the British and French to insist on the inclusion of pensions and separation allowances, which would serve the purpose not only of making the total payment to be demanded of Germany relatively enormous, but also of appeasing the British demand for a more equitable remuneration than the Empire would receive on the basis of reparations for damages alone. The Americans vigorously combated this new proposal, which in some measure vitiated their victory in the war-costs controversy; but the necessity for compromise following the bitter crisis with the French in early April (see PEACE CONFERENCE AND TREATIES) in combination with some rather illogical and sentimental arguments advanced (Mar. 31, 1919) by "the ordinarily liberal-minded" General Smuts of South Africa finally convinced Wilson of the advisability of including pensions and separation allowances, thereby more than doubling the reparations bill. The German delegation in its Comments on the Conditions of Peace, of May 29, 1919, expressed complete inability to recognize these claims as having "a legal title, as they apply to direct war costs and not to damages done to the civilian population by an act of war"; and in this contention, impartial legal opinion must sustain them.

Equally keen was the struggle waged from January to June over the question of Germany's capacity to pay. The French proposals were fantastic, the most extreme calling for a total of \$200,000,000,000 to be collected in some 50 annual installments. British suggestions ranged from the Lloyd George-Cunliffe estimate of \$120,000,000,000 to the Liberal Keynes's approximate \$10,000,000,000. The Americans, vitally inter-

ested in the speedy reestablishment of normal economic relations, labored indefatigably for the stipulation of a definite and moderate total sum, for they were of the opinion that any reasonable though arbitrary fixation would be greatly preferable to the uncertainty and consequent disorganization of Germany's credit sure to result from postponement, and they argued that France, the greatest creditor of Germany, "would benefit most by taking everything that she possibly could, by taking it quickly and writing off the balance." Their extreme proposal was for a capital sum of \$58,000,000,000 to be paid in 30 years, but the basic figure which they later consistently advocated was a total of \$25,000,000,000. Both the British and French premiers feared to accept the moderate proposals of the Americans because they fell so far below the expectations of their respective peoples. Indeed, at one juncture the seeming acquiescence of Lloyd George in plans for a reasonable settlement evoked a telegram from 370 members of the newly-elected "khaki" Parliament, warning him that they expected the fulfillment of his electoral pledges. Had the Americans offered to cancel outright or to abate appreciably the enormous indebtedness of the Allies to the United States as the "essential American contribution toward a new cooperative plan for restoring Europe and the world," they would *ipso facto* have enjoyed a "powerful trading weapon in securing the settlements they desired." This, however, the Americans consistently refused to do, asseverating that these debts "had nothing to do with reparations or rehabilitation." A special committee of liberal-minded experts, British, French, and American, appointed in March to investigate the matter, concluded that "Germany might possibly pay from \$10,000,000,000 to \$20,000,000,000 over a period of 20 to 30 years." This sound conclusion was wholly unacceptable to the more conservative advisers and plenipotentiaries. The committee then sought to attain the definition of a flexible sum, "adjustable as to amount and means of payment, within certain maximum and minimum limits." For the execution of this scheme, they proposed a Reparation Commission endowed with rather large powers and capable of becoming an instrument of "wisdom and justice." The French, seeing a chance to postpone the fixing of a definite sum of reparations and thereby to keep Germany uncertain and to avoid domestic disillusion jumped at the suggestion and advocated a commission, but one empowered merely to register the claims of the various countries under the different legitimate categories and to settle the figure of the annuities and the period of payment. "The only consideration given to Germany's capacity to make payments would be in the form of lengthening the period given her to complete them—which, by the accumulation of interest on the unpaid portion, might be extended to infinity. It practically amounted to a perpetual economic control of Germany by an Allied Commission."

The whole question came to a crisis late in March. President Wilson and his advisers fought the French proposition bitterly. Lloyd George, guided by the dictates of expediency alone, agreed now with one side, then with the other. Finally, Wilson and House reluctantly acceded to the demands of Clémenceau (Apr. 5-8, 1919), the result representing a yielding all along the line from the American view. An era of

compromise with the French was inaugurated (see PEACE CONFERENCES AND TREATIES). The problem of reparations affected not merely Germany, but the other Central Powers as well. In their respective treaties Germany, Austria, and Hungary accepted the responsibility for causing "all the loss and damage" to which the Allied and Associated Powers were subjected; and they were made jointly and severally liable for the whole amount. Bulgaria, on the other hand, was obliged to acknowledge that she had "caused losses and sacrifices of all kinds for which she ought to make complete reparation"; in other words, to assume separate responsibility for certain damages. On the Allies' side, arrangements for dividing the receipts were necessary. At the Peace Conference after a protracted struggle between the French and the Italians, the general principle was adopted that each Allied state was to share jointly with the other Allies in damage payments by any enemy nation for "all operations of war by the two groups of belligerents wherever arising." Belgium received special consideration. In addition to promised reimbursement for all her war costs, a just decision in view of her violated neutrality, she demanded priority of payment. Her representatives urged their most sweeping demands during the French crisis in early April and again during the period of threatened disruption over the Italian and Japanese settlements in late April. Though Balfour was sympathetic, Lloyd George opposed granting special concessions to the Belgians and it was largely owing to American support and the eventual winning of French consent that they were accorded a priority of \$500,000,000 in addition to compensation for their entire debt.

In addition to protesting against the inclusion of pensions and separation allowances, the German delegation in its comments on the conditions of peace (May 29, 1919) further sought an immediate and definite fixation of their liability; they offered, subject to the modification of certain economic terms, to make periodic payments in the form of annuities commencing in 1927 and amounting to 100,000,000,000 gold marks, a sum whose approximate 1919 capital value amounted to 40,000,000,000 gold marks. Lloyd George made a short-lived and half-hearted attempt to moderate the reparations burden, but it was eventually decided to reject the German proposition outright.

The Treaty of Versailles (June 28, 1919) attempted to settle the question of German liability by distinguishing between moral responsibility and material compensation.¹ "The Allied and Associated governments," according to Article 231, "affirm, and Germany accepts, the responsibility of Germany and her allies for causing all the loss and damage to which the Allied and Associated governments and their nationals have been subjected as a consequence of the war imposed on them by the aggression of Germany and her allies." "The Allied and Associated governments recognize that the resources of Germany are not adequate . . . to make complete reparation for all such loss and damage. The Allied and Associated governments, however, require, and Germany undertakes, that she will make compensation for all damage done to the civilian population of the Allied and Associated

Powers and to their property during the period of the belligerency of each as an Allied or Associated Power against Germany by such aggression by land, by sea, and from the air, and in general all damage as defined in Annex I hereto" (Article 232). Annex I set forth the 10 categories alluded to above, including pensions and separation allowances. A Reparation Commission was to be established composed of five members, four of whom were to be representatives of the United States, the British Empire, France, and Italy respectively, and the fifth to represent Belgium, Japan, or Yugoslavia, according to the specific nature of the business engaging the Commission's attention. Most of the important decisions had to be unanimous.

After receiving reports of the various governments as to the extent of their claims under the various categories, the commission was to calculate the sum total of Germany's obligations and concurrently draw up a schedule of payments prescribing the time and manner of payment within a period of 30 years from May 1, 1921. It was given discretion to extend the term and also to modify the form of payments, but not to cancel any part except with the specific authority of the several Allied governments concerned. In order to enable the Allied and Associated Powers to proceed at once to the restoration of their industrial and economic life, pending the full determination of their claims, Germany was to pay in gold, commodities, ships, securities, or otherwise, before May 1, 1921, the equivalent of 20,000,000,000 gold marks, from which should be deducted the cost of the armies of occupation and certain limited sums for the purchase of food and raw materials. Germany agreed to apply directly to reparations her economic resources, including merchant shipping, coal, dyestuffs, and chemicals, and to make restitution of cash, securities, animals, and objects of art seized or sequestered. Provision was to be made for the issuance of several series of gold-bearer bonds as determined by the Reparation Commission. Other provisions of the treaty deprived Germany of territory, population, and resources, thereby gravely impairing her capacity to pay. The German Empire, "built more truly on coal and iron than by blood and iron," had the economic foundations of its prosperity virtually swept away.

The Treaty of St. Germain (Sept. 10, 1919) required Austria to pay "a reasonable sum" on account before May 1, 1921, and to hand over all her merchant marine, 20 per cent of her river shipping, and animals, machinery, and equipment up to the limit of her capacity. The total amount due from Austria for reparation was to be fixed in May, 1921, by the Reparation Commission. A special settlement of the Austro-Hungarian debt was arranged (see AUSTRIA). In March, 1921, due to Austria's distressing financial and industrial condition, the Allies decided to waive, for the time being, all their outstanding claims against her on account of reparation and it was eventually arranged (Oct. 4, 1922) that Austrian finances should be administered by the League of Nations (see AUSTRIA), Austria being freed from any reparation payments until 1942.

The Treaty of Neuilly (Nov. 27, 1919) obligated Bulgaria to pay 2,250,000,000 gold francs in half-yearly installments for 37 years. Up to April, 1922, Bulgaria had paid 799,000,000 gold francs, and in the spring of 1923, first of all the

¹ See Robert C. Binkley's article, "The 'Guilt' Clause in the Versailles Treaty," in *Current History*, May, 1929, pp. 294-300.

vanquished nations, she was able to make definite and satisfactory arrangements with the victors. Hungary, by the Treaty of the Trianon (June 4, 1920), was to pay a reasonable sum, fixed by the Reparation Commission, before May 1, 1921, when her total liability was to be fixed by the same body, with provisions for the discharge of the balance in semiannual installments over a period of 30 years unless a respite or remission were granted by the Allies. She had to surrender all her merchant shipping, 20 per cent of her river fleet, and an indefinite quantity of live stock. Hungary's payments were long delayed by her presentation of counterclaims against Rumania for losses sustained during the invasion of 1919. In 1923-24 Hungarian finances were, like those of Austria, entrusted to the League of Nations (see HUNGARY), but Hungary was obliged to pay about \$2,000,000 a year for 20 years on her reparation obligation.

By the Treaty of Sèvres (Aug. 10, 1920), the Allies waived their claims for reparation from Turkey, although she was obligated to pay the costs of Allied armies of occupation and to compensate civilian nationals of the Allies for loss or damage suffered in the War through the action or negligence of the Turkish authorities; but even these claims were canceled by the later Treaty of Lausanne (July 23, 1924). The Reparation Commission, tentatively organized in June, 1919, was not put into formal operation until January, 1920. The German government had forthwith created, for permanent intercourse with the Commission, a special body, known as the *Kriegslasten Kommission*, the chairman of which was a permanent delegate in Paris. The failure of the United States to ratify the Treaty of Versailles was of fateful consequence as regards reparations. America was to have assumed the chairmanship of the Commission, and the vote of the American delegate would probably have been the deciding factor in all important contingencies, except where the treaty expressly required unanimity. The abstention of America (save for "observers") had the effect of throwing the chairmanship and predominant influence in the Commission to France, thereby impairing its usefulness from the start.

Although, according to the Treaty of Versailles, the Reparation Commission was to have "wide latitude as to its control and handling of the whole reparation problem," including the interpretation and administration of the reparation sections of the treaty and the receipt and distribution among the Allies of the payments made by Germany, it was also provided that members of the commission should be responsible to their respective governments alone. Consequently, the subsequent history of the reparations problem revolved not merely around the deliberation and decisions of the Reparation Commission but also around intricate and interminable negotiations between and among the various governments, with a view to achieving a settlement in consonance with seriously divergent and seemingly irreconcilable national interests. The theme of reparations thenceforth is one of confusion and of international maladjustment, of stern economic realities obfuscated by political vagaries and extravagances, of persistent French intransigence and a ruthless determination to coerce Germany into paying or to ruin her, of British vacillation and ultimate reversal of policy dictated by inexorable economic considerations, of German official remis-

ness amounting to defiance and a struggle on the part of German industrialists to escape their obligations, and of American aloofness and shortsighted pursuit of national economic advantage and a mythical political isolation.

Reparations constituted the most important single item on the agenda of the long series of Continuation Conferences inaugurated in the spring of 1920 to deal with the unliquidated problems of the peace. (See PEACE CONFERENCES AND TREATIES.) The Supreme Council of Allied Premiers overshadowed the Reparation Commission and usurped its functions. At San Remo in April, it was decided to grant the Germans a hearing, although Premier Millerand of France, by yielding to Premier Lloyd George on Turkey and to Premier Nitti of Italy on Russia, secured a pledge that the Treaty of Versailles would be enforced to the letter. Lloyd George and Millerand conferred at Hythe (May 15-16) and at Boulogne (June 21-22) for a preliminary discussion of the measures to be taken. A special commission of experts being appointed to gauge the capacity of Germany to pay, Raymond Poincaré, French member and president of the Reparation Commission, resigned in protest. At Brussels on July 2, Allied experts tentatively advised that the German indemnity should be \$60,000,000,000, including interest charges. No agreement was then possible as to the manner of distribution. Italy held out for 20 per cent. At Spa (July 5-16) Germany's request for a definite determination of the amount of reparation was denied. The discussion of coal deliveries threatened to disrupt the conference, but Germany yielded to an Allied ultimatum demanding 2,000,000 tons a month. A protocol signed at Spa on July 16 apportioned reparation receipts among the Allies as follows: France, 52 per cent; British Empire, 22 per cent; Italy, 10 per cent; Belgium, 8 per cent, Japan and Portugal, each three-quarters of 1 per cent, the remaining 6½ per cent to be reserved for Yugoslavia, Greece, and Rumania. In the disposition of Austrian, Bulgarian, and Hungarian reparations, a special arrangement was devised, 50 per cent going to the Powers in above-mentioned proportions, an additional 20 per cent to Italy, and 30 per cent to Greece, Rumania, and Yugoslavia.

Negotiations relative to reparations, continuing throughout the year, saw the development of serious differences between France and England over this question and also over Russia and Turkey. A joint conference of Allied and German economic experts was held at Brussels (Dec. 15-22, 1920, and Jan. 10, 1921). Here it was proposed that Germany should pay annual installments of 3,000,000,000 gold marks from 1921 to 1926, 6,000,000,000 from 1926 to 1931 and 7,000,000,000 thereafter until 1963. From Jan. 25 to 29, 1921, the Supreme Council met at Paris. The French from the outset objected to a fixed sum, afterward insisting that it should not be less than 400,000,000,000 gold marks, including interest. Lloyd George, supported by the Italians, vigorously objected, and a compromise decision was reached, which simply ignored the recommendations of the experts. Subject to Allied sanctions in case of default, Germany was to pay within 42 years the sum of 226,000,000,000 marks or its equivalent on a sliding scale of annuities and a further annual payment equal to 12 per cent of the value of German exports.

The German government, supported by national sentiment, frankly asserted that it could not accept the Allied terms, although it consented to attend a new conference at London (Mar. 1-7, 1921), to which it had been summoned "to agree to the decisions of the Paris Conference." On March 1, the Germans offered to pay 50,000,000,000 gold marks present value, with a deduction of 20,000,000,000 for payments already made. Lloyd George, replying on March 3, rejected the German offer, insisted that Germany's responsibility for the War was decided by the Treaty of Versailles founded on that fact, and delivered an ultimatum requiring acceptance of the Allied reparation demands within four days. Lloyd George was supporting French plans in Europe in order to secure French acquiescence in British Near Eastern projects. The German reply being deemed unsatisfactory, a force of French, Belgian, and British troops occupied (Mar. 8, 1921) the cities of Dusseldorf, Duisberg, and Ruhrort in the heart of one of Germany's greatest industrial regions. The results of this *coup de force* were nugatory, however, and France threatened to occupy the whole Ruhr Basin. New schemes were then propounded, including a further German request for American mediation.

A conference of the Entente premiers was held at Hythe (April 23-24) to formulate a tentative programme for the enforcement of Allied terms. On April 27, the Reparation Commission announced that it had decided unanimously to fix at 132,000,000,000 gold marks the amount of damages for which reparation was due. Of this, approximately 45,000,000,000 were for material damage and 87,000,000,000 for pensions and separation allowances. Germany was to pay this in addition to Belgium's war debt, provisionally estimated at 4,000,000,000 gold marks. Three series of bonds were to be issued, bearing 5 per cent interest and 1 per cent amortization: series A, comprising 12,000,000,000, and series B, 38,000,000,000, to be issued in 1921; and the third, series C, for 82,000,000,000, to be issued at the discretion of the commission. Payments were to be made in the form of annuities supplemented by 26 per cent of the value of German exports. The acceptance of the Commission's reduction of claims without a murmur by the Supreme Council marked the end of the exclusively political period of the reparations question. The Allied Conference of London convened on April 30; on May 5 it dispatched to Germany an ultimatum requiring acceptance of these terms. Confronted with the threatened French occupation of the Ruhr, Germany yielded on May 10. The Fehrenbach ministry, organized in July, 1920, had been superseded during the crisis by a new coalition cabinet headed by Chancellor Wirth.

Although Germany subsequently sought modification of these terms, France insisted that she carry them out. The first payments due were paid, and on September 29, Dusseldorf, Duisberg, and Ruhrort were evacuated. On Oct. 6-7, 1921, an economic pact was concluded at Wiesbaden by Rathenau and Loucheur, the German and French ministers of reconstruction; it provided for more effective reparation in kind, similar provisions in the Treaty of Versailles having been nullified by the obstructionist tactics of French industrialists and trade-unionists. France was to receive building materials from Germany in lieu of her share of the 26 per cent export tax, and Germany was to be credited with not more than 1,000,000,

000 marks each year for 14 years to cover such deliveries. Only a few deliveries were made under this plan, however, even as revised in 1922. Meanwhile, the German government was encountering extraordinary difficulties in financing reparations payments due in part to the world-wide business depression and to the policy of truculent opposition of German industrial magnates, led by Hugo Stinnes.

An economic conference held at Brussels during September, under the auspices of the League of Nations, deliberated on feasible measures to prevent financial and economic chaos in Europe, but although its discussions proved illuminating, its activities were relatively fruitless. Unsound war finance and peace-time burdens led to a marked decline in the value of German currency. A serious flight of capital from Germany, effected through the exchange of marks for foreign currency, greatly aggravated the situation. The fall of tax receipts to an insignificant value resulted in prodigious budgetary deficits which impelled the Government to embark on an inflation policy, leading in turn to still further depreciation of the value of the mark. See GERMANY.

All these factors tardily convinced the Reparation Commission that Germany needed relief from cash payments, and at brief intervals Allied conferences were held, at each of which the amounts currently payable by Germany were reduced. On Dec 14, 1921, the German government officially notified the commission that it would be unable to pay the installment due Jan 15, 1922, or the other quarterly installments due in 1922, and in lieu thereof it proposed a smaller payment. This led to an Allied investigation and discussion of the problem at conferences held at London on Dec 22, 1921, and at Cannes on Jan 4-13, 1922. Lloyd George offered France a defensive, political, and military alliance in return for a modification of its attitude toward Germany, but French public and parliamentary opinion was opposed to concession. The conference was suddenly disrupted by a ministerial crisis in France which resulted in the displacement of Premier Briand by ex-President Poincaré, an ardent Nationalist and implacable enemy of Germany. This change in the French government presaged a serious rift in Entente solidarity and definitely prefigured the military occupation of the Ruhr. On January 13, the Reparation Commission granted a provisional and partial moratorium to Germany. On Jan. 28, 1922, Germany offered to pay 720,000,000 gold marks cash annually, distributed evenly throughout the year with 1,450,000,000 gold marks annually in kind. On March 21, the Commission decided to accept Germany's proposal, although in addition it stipulated that Germany should institute sweeping reforms in her financial administration and prevent further flight of capital from the country.

Premier Poincaré, whose diplomatic policy diverged widely from that of Lloyd George, strongly advocated leaving the problem of reparation to the Reparation Commission, but it soon found its way into the agenda of the Supreme Council again. On Mar. 11, 1922, the Paris Conference requested the Commission to study the possibility of a German external loan. The International Bankers' Loan Committee, which met between May 24 and June 10, found such a plan impracticable so long as Germany's external obligations were not reduced. Poincaré

categorically refused to allow the international loan to be made contingent upon a new reduction of French claims. His whole attitude offended the bankers, especially J. P. Morgan of New York. Meanwhile, the 34-Power plenary conference held at Genoa (April 10-May 19), revealed even more strikingly the grave impasse in international reconstruction presented by the reparation and Russian problems (See *RUS-SIA*.) Prospects of a Russo-German rapprochement, signalized by the Treaty of Rapallo (April 16), which provided for the reestablishment of diplomatic relations and mutual renunciation of war claims and financial obligations, angered the Allied governments and recemented the Anglo-French Entente temporarily, but otherwise the deliberations of six weeks proved devoid of practical consequences. On July 14, 1922, the German government requested an extended moratorium, and a somewhat reduced reparation payment was made under evident duress on July 15.

The thirteenth Inter-Allied Continuation Conference was convened at London during August, 1922, to discuss reparations and war debts. On August 1, the British foreign minister, Balfour, issued a note offering to remit all war loans due Great Britain and to abandon all further rights to German operations if reciprocal action were taken by other nations. He offered to cancel the \$12,000,000,000 due Great Britain, if the United States would cancel the British obligation of \$5,000,000,000. The American government refused to entertain any such proposition (see *UNITED STATES*), but Great Britain announced the intention of collecting in principal and interest only so much as she would be required to pay to the United States. At the London Conference, the British and French premiers were absolutely deadlocked on the subject of German reparations, although Berlin was granted a respite on the August 15 payment and it was agreed that henceforth the obligation of collection should rest on the individual governments. Poincaré favored imposing stringent "productive guarantees" on Germany and suggested elaborate schemes for the control of German resources. On August 31, a compromise arrangement was devised, granting Germany a conditional respite for six months, simultaneously, a new agreement for delivery of reconstruction supplies to France was negotiated by Hugo Stinnes and Senator de Lubezac.

With the passage of months, however, the situation grew worse and worse. A committee of foreign financial experts reported that stabilization of the mark was dependent on Germany's own efforts. On Nov. 8, 1922, the German government requested an indefinite moratorium on all payments and a revision of the total to be paid. Great Britain, more keenly desirous of stabilizing Germany and restoring the German market, consistently pursued a policy of opposing French militarism and of advocating the fixation of a definite and reasonable sum of reparation. Poincaré adhered to his policy of no concession and ruthless coercion. Belgium was definitely allied with France, while Italy, for business reasons, supported the British until the Fascist *coup d'état* produced an Italian dictatorship more sympathetically inclined toward French strong-arm measures. The autumnal crisis in Near Eastern affairs (see *PEACE CONFERENCE AND TREATIES*) exacerbated Entente differences. The downfall of Italian, German, and British cabinets (see *ITALY, GERMANY, and GREAT BRIT-*

AIN) failed to clarify or ameliorate the situation. Another Allied conference, attended at London (December 9-11) by the British, French, Belgian, and Italian premiers, accomplished nothing beyond exchange of views. On Dec. 20, 1922, the Reparation Commission, despite British opposition, declared Germany in voluntary default on 1922 wood deliveries. On Jan. 9, 1923, similar action was taken in regard to coal deliveries, notwithstanding the fact that the commission had tacitly acquiesced in slight German undershipments for months past. The real motive appeared to be to render more plausible the alleged necessity for the contemplated seizure of the Ruhr coal region. Meanwhile, at an Allied conference in Paris (Jan. 2-4, 1923) detailed plans were presented for coping with the problems of reparations and international indebtedness. Great Britain affronted Belgium by demanding that she surrender her priority and aroused the indignation of France and Italy by requesting them to forfeit certain gold deposits which they had maintained (theoretically) in London as security for British war credits. Great Britain and France, although agreeing on a reduction of the reparations total to 50,000,000,000 gold marks and the institution of a comprehensive financial control over Germany, were diametrically opposed on methods of guarantee. Bonar Law, combating the punitive measures proposed by Poincaré, declared that their execution would not produce reparation. The French, whose prime consideration was to maintain security by rendering Germany impotent, refused to agree to any practical programme.

France and England had reached the parting of the ways. On January 11, after preliminary warnings, a Franco-Belgian army occupied the Ruhr Valley, the heart of industrial Germany, containing her principal coal and iron deposits, her greatest industrial establishments, and 7,000,000 inhabitants. The legality of this procedure was denied by the Germans and doubted by the British, but the French and Belgians, brooking no criticism, announced that they were acting under the provisions of Paragraphs 17-18 of Annex 2 to Part VIII of the Treaty of Versailles, which authorized the respective Allied governments in case of a voluntary default by Germany to take such measures as they deemed necessary. Although embarrassed from the outset by civil obstruction and passive resistance on the part of the inhabitants, including trade-unionists and industrialists (see *GERMANY*), the French took strong measures of repression and retaliation, and by March they had an unbroken military and customs line stretching from Switzerland to Belgium and Holland. All the rigors of military rule were enacted in the Ruhr, thousands of Germans being intimidated, incarcerated, or exiled, and the normal activities of industrial life almost completely suspended. For months the French and German governments remained obdurate in their determination not to yield, the British seeking in vain to effect a compromise settlement. Gradually, Germany, seriously crippled by the disruption of her economic system, was forced to recede from her extreme attitude. On May 2 and June 9, 1923, she outlined a new proposal involving the mortgaging of her railway system, the offering of guarantees on other industries, and the pledging of certain import and excise duties to reparation payments. Guaranteed annuities, secured by these means, and totaling 1,200,000,000 gold marks, were to

be paid after July, 1927. The Ruhr was to be evacuated and economic connections with Germany reestablished. Germany also agreed to submit to determination by an international commission of her capacity to make further payments. On June 8, Poincaré flatly refused to discuss any offer as long as the German resistance in the Ruhr continued. He made it perfectly clear that France and Belgium intended to retain control of the Ruhr until Germany paid the schedule of reparations fixed in May, 1921. By degrees, the French had restored a semblance of economic order in the Ruhr region, and partial production was resumed. Nevertheless, Great Britain remained antagonistic, the United States appeared distinctly unsympathetic, Italy failed to back the Ruhr policy vigorously, opposition developed in Belgian labor and shipping circles, and protests were made by Sweden, Holland, and Switzerland. In a note of July 20, 1923, the British government, while pronouncing the German proposals unacceptable, suggested that they were at least worthy of consideration, and to this end it proposed an investigation of the reparations situation by a committee of impartial experts. An exchange of notes during the summer merely confirmed the French in their intransigent attitude of utilizing only the Reparation Commission as an administrative or investigating body and of retaining the Ruhr until full payment was made by Germany.

The French note to Great Britain (of July 30) deserves quotation

An eye for an eye, a tooth for a tooth. In strict accordance with the precedent established by Germany in 1871, the Ruhr District will be released only when Germany pays. The Reich must be brought to such a state of distress that it will prefer the execution of the Treaty of Versailles to the condition created by the occupation. German resistance must cease unconditionally, without any compensation. Germany's capacity to pay cannot be established at all in presence of the present confusion in her economy. Furthermore, it is absurd to fix it definitely, as it is continually changing. The German Government will never recognize any amount as just and reasonable, and, if it does, it will deny it on the following day. In 1871 nobody in the world cared whether France considered the Treaty of Frankfurt just and possible of execution. And what about the investigation of Germany's capacity to pay by impartial experts? What does impartial mean? Who has to select the experts? What will be their relation to the Reparation Commission? Even Lloyd George in January, 1921, rejected the recommendation of the experts which were assembled at Brussels, and declared that he attached no value to them. What is to be done in the Ruhr District after the abandonment of passive resistance cannot be decided now, it depends entirely on the attitude of the Reich and the German people.

By September, 1923, German passive resistance in the Ruhr had definitely broken down and subsequently her industrial magnates were forced to come to terms with the French. A series of short-time agreements henceforth regulated German deliveries in kind.

On Oct. 5, 1923, the Reparation Commission announced that up to June 30, 1923, reparation payments had totaled 8,213,670,000 gold marks, of which 3,250,000,000 was in merchandise, 1,900,000,000 in cash, and the remainder in the form of credits for shippings, cables, Saar Valley mines, and ceded territories. Of this total, 5,494,782,000 gold marks had already been allocated to Allied recipients: 1,255,339,000 to Great Britain, 1,803,967,000 to France, 1,730,126 to Belgium, 338,621 to Italy, 204,368 to Serbia, 68,368 to Japan, and lesser amounts to other countries. Germany, however, contended that she had paid gold and cash to a value of more than 45,000,000,000 gold marks. The most ex-

haustive nonpartisan study made up to 1924 would indicate that Germany had paid from 20,000,000,000 to 26,000,000,000 gold marks. The advancing months of 1923 saw a slightly more cooperative attitude on the part of the American government. While the United States had maintained continuous unofficial relations with the Reparation Commission through "observers," she had consistently refused to be officially represented at any international economic conference. (See UNITED STATES.) In October, 1923, in response to British inquiries, the United States government expressed the opinion that "competent American citizens would be willing to participate in an economic inquiry . . . through an advisory body appointed by the Reparation Commission." France, while emphasizing her continued opposition to reduction of the German obligation, eventually consented to the inquiry. The Reparation Commission voted (Nov. 23, 1923) to appoint two committees of experts, one to inquire into means of balancing the German budget and of stabilizing German currency, and the other to examine and report on the extent and methods of the export of German capital to avoid reparation payments. On December 27, the personnel of the committees was announced, the first comprising 19 members, including Charles G. Dawes and Owen D. Young, prominent American financiers and business men, and the second, five members including H. M. Robinson, an American banker. All the experts were men of large experience in the fields of public or private finance. The first committee met at Paris on January 14, with General Dawes as its chairman; and the second, on January 21, with Reginald McKenna of Great Britain as president.

After three months of exhaustive investigation and deliberation, the Dawes Committee made a unanimous report to the Reparation Commission on Apr. 9, 1924. In essence, this report provided (1) Germany must meet to the full extent of its capacity its external obligations as imposed by the Treaty of Versailles; (2) the payments should be made on a sliding scale beginning with 1,000,000,000 gold marks for the first year, to be increased after four years to 2,500,000,000 gold marks annually; (3) these charges should be defrayed from taxation, the railways, and industrial debentures, and a mortgage for this purpose should be placed on the industries of the country; (4) an index of prosperity should be devised and utilized, as more reliable than an index of export statistics in determining Germany's ability to pay more than 2,500,000,000 gold marks annually after the first five years; (5) a foreign loan of 800,000,000 gold marks should be obtained, so as to satisfy the requirements of the gold reserve and to aid in the payment of immediate obligations; (6) a bank of issue should be created to promote the stabilization of German currency, as a fundamental economic prerequisite; (7) an international organization of control should be set up, to consist of a trustee for railway and industrial bonds, three commissioners of railways, the bank, and revenues, and an agent in charge of the actual payment of reparations; and (8) France and Belgium should relinquish economic control of the occupied territories.

The McKenna report (Apr. 5, 1924) estimated that 6,750,000,000 gold marks had been exported from Germany and pointed out that the total foreign money lost through investment in German marks equaled the total sum of reparation

cash payments made by Germany to date. The experts' reports elicited widespread commendation in Allied and neutral countries and in Germany, although some complaint was made that the Dawes committee had not been able to fix the total of German obligations. The Reparation Commission on April 11 approved the reports as offering a practical basis for rapid solution of the reparation problem, and by the middle of April, the several Allied governments, as well as Germany, accepted them in principle. The Germans announced, however, that the evacuation of the Ruhr was indispensable for Germany's complete cooperation. The French, just recovering from a serious financial crisis due to the fall of the franc (see FRANCE), expressed satisfaction with the Dawes plan, though reviving the old question of guarantees.

The situation was somewhat clarified by the outcome of the Franco-German elections of early May. In Germany, parties pledged to acceptance of the plan won a majority in the Reichstag, although not the two-thirds required for the alienation of control over the national railway system contemplated by Dawes and his associates. In France, Premier Poincaré's *bloc national* was defeated, and in June the Radical Socialist leader, Édouard Herriot, became Premier. He immediately relaxed the coercive control over the Ruhr and permitted the return of some hundreds of thousands of German exiles. During June and early July, he cooperated cordially with Ramsay MacDonald, the Labor Premier of Great Britain, in endeavoring to ensure Entente solidarity in putting the Dawes Plan into operation. A new Allied conference on reparations, the first since January, 1923, was called to meet in London on July 16, 1924. Preliminary conversations between Herriot and MacDonald, however, while producing cordial personal relations, revealed in all their grim significance the time-honored obstacles to a complete and harmonious settlement, namely, French insistence on adequate sanctions and security and full payment, together with opposition to any British attempt to supersede the Reparation Commission by any other international agency.

The London Conference lasted from July 16 to Aug. 16, 1924. Ten countries were represented; the British Empire, France, Italy, Japan, the United States, Belgium, Portugal, Greece, Rumania, and Yugoslavia. Among the prominent personages who participated in the deliberations were Prime Minister MacDonald of Great Britain as presiding officer, Premier Herriot of France, Premier Theunis of Belgium, Frank B. Kellogg, the American Ambassador to Great Britain, and later on, Chancellor Marx and Foreign Minister Stresemann of the German Reich.

In its initial stages, the Conference was confined to the endeavor of the Allied delegations to agree on a common programme before negotiating with the Germans. Three committees were constituted, the first to deal with the matter of German defaults in reparation payments and the sanctions to be applied in cases of willful defaults, the second to prepare recommendations on the restoration of German fiscal and economic unity as postulated by the Dawes Committee, and the third to perfect arrangements regarding the transfer of payments from the receiving agency in Berlin to creditor countries. Premier Herriot and his French associates, in compliance with pledges previously exacted by ex-Premier Poincaré not to surrender any French rights

under the Treaty of Versailles or to relinquish control of the Ruhr, accepted in principle the view that it was unnecessary, if not impossible, to define exactly the penalties to be imposed on Germany in contingencies such as that which preceded the occupation of the Ruhr, and it was undoubtedly as a concession to these French susceptibilities that on July 19, Committee One unanimously agreed that all rights enjoyed by nations under the Treaty of Versailles were to be preserved intact. At the same time, it was further unanimously agreed that investors in the projected loan of 800,000,000 gold marks to Germany were to be guaranteed a prior lien on German resources in event of willful German default. The decision as to whether any default was willful or not was to rest with the original Reparation Commission, but it was obligated to consult the new agent general of reparations.

A grave crisis immediately developed regarding the loan formula. This deadlocked proceedings for a week, severely strained the conference atmosphere, and threatened to disrupt negotiations altogether. The American and British bankers who were depended on to underwrite the loan objected that the potential application of sanctions by one or more powers, acting not in consonance with all the other Allies but separately, would seriously jeopardize the interests of investors and render the floating of a large loan virtually impossible. Nevertheless, there was a strong resurgence of extreme French nationalism in the Paris press and political circles of opposition, where bitter criticism was leveled at Anglo-American financiers, and there was also manifest tension at London between British and French delegates. Matters were smoothed over by the friendly intervention of the American representatives. A less unyielding attitude was adopted by the naturally conciliatory Herriot. He and his colleagues busied themselves in devising a formula which would safeguard vital French interests at the same time that it would satisfy the demands of the bankers for reasonable safety for their investments. In response to friendly but firm pressure by MacDonald, Herriot decided to defy Poincaré and to consider an early evacuation of the Ruhr. Several critical days elapsed before a gradually evolved French plan for a special arbitration committee to decide on defaults, together with an offer to withdraw completely from the Ruhr within two years, gained ground in the conference despite the reluctance of the British. On August 1, the deadlock was broken when Committee One accepted Herriot's arbitral scheme, and on August 2, full accord was reached by the conference on all outstanding points.

The second phase of the conference opened on August 5, when the report as adopted in plenary session was placed in the hands of Marx and Stresemann, the German representatives dispatched to London. The German chancellor praised the Dawes Report and expressed the desire of his government to carry out its provisions in good faith. He emphasized Germany's concern on two points: first, the complete economic evacuation of the Ruhr; and secondly, the early abandonment of French military occupation of the region. On August 7, the Germans accepted the Allied default arrangement without amendment. On August 8, Herriot left for Paris, where at a ministerial council (August 10) he secured the approval of his colleagues for his actions and an authorization from President

Doumergue and Marshal Foch to settle the Ruhr occupation solely with regard to reparations, thereby temporarily subordinating the question of security. The French simultaneously declared in favor of disarmament control over Germany by the League of Nations. Meanwhile, affairs progressed rapidly at London, through a promising spirit of mutual conciliation and cooperation. On August 10, the Reparation Commission (sitting at London) and the German representatives signed a protocol for setting the Dawes Report in operation, and on August 16, a general protocol with four annexes was adopted incorporating this and all other agreements of the conference.

Briefly, the agreements were as follows: Germany was to promulgate and enforce the laws required to carry out the Dawes Report, especially those provisions relating to the bank, railways, and industrial debentures, and to apply certain provisions regarding the control of the revenues assigned as security for the annuities. The Reparation Commission on its part undertook to help execute the recommendations of the Dawes Report, especially in the way of facilitating the projected loan and making an accounting of necessary adjustments. Disagreements between the German government and the Reparation Commission as to the interpretation of this agreement and of the German legislation involved were to be resolved by a special committee of three arbitrators appointed one each by the commission and the government and a third, an American, as presiding officer, to be appointed by joint action, or, failing agreement, by the President of the Permanent Court of International Justice. Germany further agreed to facilitate in all ways possible the making of deliveries contemplated under either the Treaty of Versailles or the Dawes Report, the programme of such deliveries, in case of non-agreement either between members of the Reparation Commission or between the Reparation Commission acting unanimously and the German government, was to be determined by a committee of three independent and impartial arbitrators, whose chairman should be an American citizen. A mixed committee of Allied and German representatives was to determine procedure for deliveries in kind. Differences in opinion between the German government and the Transfer Committee contemplated under the Dawes Report were to be settled by reference to an arbitrator chosen by the President of the Court of International Justice. Provision was made for dealing with "concerted financial manoeuvres." Technical improvements in reparations proceedings might be made through submission of any disputed points to an impartial arbitral committee. The Allied governments engaged with Germany to assist in the speedy restoration of a large measure of Germany's fiscal and economic unity. The French were to evacuate the Ruhr completely within one year. Furthermore, "in order to bring about mutual conciliation and in order to wipe out the past to the utmost extent possible," the Allied governments and the German government exchanged reciprocal assurances of general amnesty for nationals having committed political offenses in the occupied territory since Jan. 11, 1923. Such modifications in Annex II of the Treaty of Versailles as were made necessary by the Dawes Report and the London Compact were specifically sanctioned by an inter-Allied agreement constituting Annex

IV of the London Protocol. The Allied governments agreed to safeguard specific securities pledged to the service of the 800,000,000-gold-mark loan and granted investors a prior claim on any resources of Germany, subject to a general charge in favor of the loan.

The German Government immediately summoned the Reichstag in special session and on August 29, the requisite laws for the execution of the Dawes Plan were enacted. As these laws not only imposed heavy financial burdens upon the German people in accordance with reparation requirements but also introduced foreign cooperation in the management of important branches of German economic activity, their passage was naturally preceded by a severe political contest, but the Government carried its entire programme, even securing the requisite two-thirds majority (314-127) necessary to alter the constitution of the Reich so as to authorize the conversion of the state-owned and operated railways into a private company. Meanwhile, the French Parliament had sustained Herriot's policy in several decisive votes of confidence. In accordance with promises made to the German plenipotentiary at London (August 16), the French and Belgian governments ordered the military evacuation of the zone of Dortmund and the territories outside of that of the Ruhr occupied since Nov. 15, 1923. The British government warmly urged an early evacuation of the Ruhr. On August 30 took place the actual signing of the Conference agreement at London.

The London Conference was undoubtedly a success. It was made so by the partial supervision of economic realities hitherto obfuscated by political vagaries and extravagances, and it was also helped by the astute but frank diplomacy of the liberal-minded premiers, MacDonald and Herriot, by the friendly counsel of American representatives and by a cooperative attitude on the part of the German delegates. The vital issue of security for France, temporarily subordinated at London, was to receive attention at the ensuing September meeting of the League of Nations Assembly. See LEAGUE OF NATIONS. The question of inter-Allied debts, so inextricably intertwined with the reparation problem both historically and in actual fact, had been inflexibly debarred from discussion at the conference and was destined to cause considerable trouble in the year to come. See below.

On Sept. 1, 1924, the Dawes Plan was put into operation. For the transition period, the office of Agent General for Reparation Payments was assumed by Owen D. Young who was then succeeded on October 31 by Seymour Parker Gilbert, former Assistant Secretary of the Treasury in the United States. In Germany, the Reichsbank and the railway régime were definitely reconstituted, certificates for the Railroad and Industrial Bonds had been deposited with the Trustees. The French and Belgian governments relaxed their grip upon the economic and administrative life of the Ruhr and German control was reestablished. Negotiations between the German Chancellor Luther and Dr. Schacht, President of the Reichsbank, on the one hand and the Bank of England and J. P. Morgan & Co. on behalf of the lender, culminated in a loan agreement signed October 10. The terms were 7 per cent interest, issue price 92; repayment Oct. 15, 1949, by means of a sinking fund—in America at 105 per cent, in other countries at par. The loan

was underwritten by the bank at 87 per cent in America and 87½ per cent in Europe. America was to subscribe \$110,000,000, Great Britain £12,000,000; Holland, Sweden, Switzerland, France, Belgium, and Italy smaller amounts. The balance of £360,000 necessary to round the net proceeds up to 800,000,000 gold marks was raised in Germany through the Reichsbank. The Reparation Commission granted the service (i.e., interest and amortization payments) of the loan an absolute first charge on all payments under the Dawes Plan or any other assets or revenues of Germany subject to an Allied lien. The German Government recognized the service of the loan as a direct and unconditional obligation of the Reich. The issue of the loan took place in New York and London Oct. 14, 1924, and was a brilliant success.

On October 10, in conformity with the London Agreement, the Reparation Commission appointed Thomas N. Perkins of Boston its American member for the execution of the Dawes Plan. (Perkins resigned Apr. 17, 1926, and was succeeded by Walter P. Cooke.) Other officials, in addition to S. Parker Gilbert as permanent agent general for reparation payment, included G. W. Bruins (Dutch) as commissioner of the Reichsbank, Gaston Lervet (French) as commissioner of the Railways; Sir Andrew McFadyen (British) as commissioner of Controlled Revenues; Léon Delacroix (Belgian) as trustee for the German Railway bonds, and Bernadino Nogara (Italian) as trustee for the industrial debentures. The Transfer Committee embraced, besides the agent general as chairman, another American, and French, British, Italian, and Belgian members. The Reparation Commission's function and activities being thus largely restricted, a drastic reduction of its staff took place in the course of a few months. A special committee of four German and four Allied members provided for in the London Agreement to adopt an orderly procedure regarding all deliveries in kind, met in Paris on Nov. 6, 1924, and after exhaustive labor reported a plan for a simple and expeditious system to the Reparation Commission, May 9, 1925, which with some amendments was accepted and put into operation on May 1, 1925. The Transfer Committee likewise took steps to gain jurisdiction over certain arbitrary 26 per cent levies on imports from Germany which Great Britain and France were collecting under their own national laws (Reparation Recovery Acts).

Meanwhile (Oct. 27, 1924), the financial experts of the Allied governments and of the United States met in Paris to resume, after a long interval, the discussion of the distribution among themselves of the German reparation payments. The United States presented a demand to be indemnified for its war claims as recognized under the German-American Treaty of Berlin Aug. 25, 1921, and for its Army-of-Occupation costs out of the annuities under the Dawes Plan. Moreover, the reparation accounts prior to Sept. 1, 1924, were in a state of confusion owing to the Franco-Belgian practices during the Ruhr Occupation. After weeks of work, the experts were unable to arrive at any definite arrangement, consequently a conference of Allied Ministers, of France, and of Frank Kellogg, American Ambassador to Great Britain, began in Paris Jan. 6, 1925. After compromising their conflicting interests and claims, they reached an understanding (January 14) known

as the Financial Agreement of Paris. France and Belgium submitted the following account for the period Jan. 11, 1923–Sept. 1, 1924: Income: Fines and requisitions 45,500,000 gold marks; deliveries in kind 446,400,000 gold marks; cash receipts from coal tax, customs duties, railway revenue, forests, passports, etc. 490,000,000 gold marks, from which were to be deducted expenses of political administration, industrial operation, and military maintenance to the amount of 184,000,000 gold marks, leaving a net income from cash receipts of 306,000,000 gold marks. The conference, however, after stipulating that deliveries in kind and cash receipts were to be accounted for separately (the Reparation Commission on Dec. 18, 1925, fixed the value of deliveries in kind at 469,868,000 gold marks and the cash receipts at 423,362,000), provided that military expenses in the Ruhr were to be deducted from the value of deliveries in kind only to the extent that they exceeded the normal cost of the maintenance of troops in garrisons at home. The net amount of deliveries in kind then remaining was to be charged to the reparation account of the recipient countries. From cash receipts should be deducted only the civil cost of collection and administration and the cost of the operation of industrial enterprises. Of the balance, everything beyond a sum of about \$14,750,000 already set aside for American expenses of occupation was to be transferred to Belgium on account of her priority.

The German annuities on the Dawes Plan as from Sept. 1, 1924, should be allocated on the following basis: (a) *Prior Claims*—(1) service of reparation loan, about 93,000,000 gold marks per annum (2) expenses of the Reparation Commission and the new administration, 9,250,000 the first year, but not in excess of 7,500,000 thereafter; (3) Inter-Allied Rhineland Commission expenditures, 10,000,000 and Military Control Commission, 8,000,000 for first year—subsequent allowances to be fixed later; (4) payment of 55,000,000 gold marks annually to the United States beginning Sept. 1, 1926, for amounts in arrears of the cost of her Army of Occupation, superseding the so-called Wadsworth Agreement of May 25, 1923; (5) special appropriation gradually increasing from 15,000,000 to 30,000,000 gold marks for arrears of occupation costs incurred by France and Great Britain before May 1, 1921; and (6) for current costs of occupation in first-year advance payment in lump sums of 110,000,000 gold marks to France, and 25,000,000 each to Belgium and Great Britain, any excess cost to be borne by each Power out of its share of the annuity.

For later years, a new settlement was to be made prior to Sept. 1, 1925. The balance of the German annuity should then be applied to the payment of: (b) *Other claims*—(1) 5 per cent to the payment of the Belgian war debt, of which, provisionally, France should receive 46 per cent, Great Britain 42 per cent, and Belgium herself 12 per cent on account of her debt to America; (2) for restitution, 1 per cent of the total during the first four years, in subsequent years, 1 per cent of the first billion gold marks after deducting preferred claims and 2 per cent of the balance of the annuity; (3) Belgian priority, the exact remaining amount to be ascertained by the Reparation Commission. Regardless of that, however, Belgium should receive her share of 8 per cent during the first year, the same percentage monthly during the

second year until the priority should be completely liquidated; thereafter or at latest from Sept. 1, 1926, a reduced percentage of 4.5 per cent, the other 3½ per cent to go to France and Great Britain in the proportion of 52 to 22; (4) after deducting priorities, a share of 2.25 per cent to the United States subject to a maximum limitation of 45,000,000 gold marks per annum with a similar percentage in the distribution and joint realization of all securities issued under the Dawes Plan; (5) otherwise, the Spa percentages remained unchanged, viz.,—52 per cent for France, 22 per cent for Great Britain, 10 per cent for Italy, and 5 per cent for Serbia, etc.

Greece was accorded 0.4 per cent of payments by Germany and of the first half of payments by Austria, Hungary, and Bulgaria, and 25 per cent of the second half of payments by Austria, Hungary and Bulgaria—Rumania was given 1.1 per cent of German payments and of the first half of Austrian, Hungarian, and Bulgarian payments and 20 per cent of the second half of the latter. In addition, there were complicated miscellaneous provisions which need not be mentioned here. Since the United States participated officially in the arrangement, European diplomats and publicists expressed satisfaction at her recent entry into Allied negotiations regarding German affairs and spoke glowingly of America's adhesion as "an insurance policy on the payment of reparations."

The Coolidge Administration, however, in defending itself against attacks by isolationist senators and editors, steadily insisted that the United States remained as free from European entanglements as she was before. Public opinion, nevertheless, was divided on that point.

There is no gainsaying the fact that the Dawes Plan gave Germany, Europe, and the world a much-needed respite from controversy over reparations during the period of 1924–1929. Political and diplomatic attention shifted in considerable measure to other subjects—to the cognate and not less vexatious problem of inter-Allied indebtedness, to (theoretically) domestic questions of stabilizing currencies and balancing budgets (see FRANCE; ITALY; GREAT BRITAIN, etc.), and to the great central issue of arbitration, security, and disarmament (see LEAGUE OF NATIONS; UNITED STATES, etc.). Allied nations, creditors of Germany, felt the shoe on the other foot in adjusting their enormous obligations to the United States government and much ill-will and resentment were engendered. Nevertheless, following the lead of Great Britain, which had signed a debt settlement agreement with the United States on June 19, 1923, the other countries were brought by inexorable circumstances to the same course of action, viz., Finland May 1, 1923; Hungary, Apr. 25, 1924; Lithuania, Sept. 22, 1924; Poland, Nov. 14, 1924; Belgium, Aug. 18, 1925; Latvia, Sept. 24, 1925; Czechoslovakia, Oct. 13, 1925; Estonia, Oct. 28, 1925; Rumania, Dec. 4, 1925; Italy, Nov. 14, 1925; France, Apr. 20, 1926 (not ratified by French Parliament until July 26, 1929); Yugoslavia, May 3, 1926, etc.

All of these agreements, though providing for nominal repayment of principal in full, arranged for appreciable reductions in the rate of interest, thus having the effect of partial cancellations, varying from 19.3 per cent in the case of Finland, and 19.7 in the case of Great Britain, to 52.8 per cent for France, 53.5 per

cent for Belgium, 69.7 per cent for Yugoslavia, and, highest of all, 75.4 per cent for Italy. Great Britain, however, though a debtor to the United States, was a creditor to other countries yet pledged by the Balfour note of Aug. 1, 1922, to collect no more from Germany and the Allies than should be necessary to meet the obligations to the United States. She negotiated settlements as follows with Soviet Russia initiated Aug. 8, 1924, but never ratified; with Italy, Jan. 27, 1926, with France, July 12, 1926. The British-Italian agreement in effect wrote off all interest obligations together with 27 per cent of the principal. The Franco-British arrangement provided for repayment of the entire principal and funded accrued interest, but reduced the interest rate to less than 1 per cent, thus in effect cancelling a substantial portion of the French obligation.

France was particularly unlucky, however, in that she was the greatest sufferer from Soviet Russia's debt repudiation policy (see RUSSIA), since her holdings of the Russian pre-war debt had aggregated no less than two-thirds of the total, with lesser amounts due to Great Britain, Germany, Belgium, and the United States. During the World War, Russia had doubled her foreign indebtedness, borrowing 5,375,000,000 rubles from Great Britain, 1,492,000 from France, and 553,000,000 from the United States. The Soviet government's inability and unwillingness to shoulder these debts coupled with its eagerness to secure additional credits from abroad conditioned, almost as much as communist propaganda, Russia's entire diplomatic relations with the great capitalistic states of the world. After all, nearly seven billion dollars, exclusive of unpaid interest, was a prodigious sum.

The most amazing aspect of the whole situation was the consistent policy of the United States government in refusing officially to recognize or acknowledge in any shape or fashion that any connection whatever subsisted between the reparation problem and the problem of inter-Allied indebtedness, though the basic principle of capacity to pay was generally applied by the Washington authorities, as has been demonstrated above. Since in the last analysis no effective payments could be made either by Germany on reparations account or by other countries on debt-settlement account except by developing an excess of exports over imports, the high-tariff system of the United States and to a correlative extent of other countries (in their creditor capacity) was an important factor. This situation resulted in the promulgation (Oct. 20, 1926) of a manifesto signed by leading bankers and industrialists of 16 countries including the United States (e.g., J. P. Morgan) appealing to the nations of Europe to tear down the barriers created by tariffs, special licenses, prohibitions, and other commerce to flow in its natural channel unimpeded. But needless to say, these and other pleas had no effect on the Republican Administration of the United States.

Reverting to the Dawes Plan, it is necessary to comprehend that although on the surface it worked satisfactorily during the first five years of its operation, certain factors rendered it extremely doubtful whether continued smooth running could be expected. In the first place, the German budget did not begin to feel the full strain until the reparation year commencing Sept. 1, 1928. The following table shows the development of sources of reparation payments

up to the normal annuity, as provided in the Dawes Plan and London Agreement:

First year, 1925-1926	Million gold marks
From railways	200
From reparation loan	800
	1,000
Second year, 1925-1926	
From railways	595
From transport tax	250
From industries	125
From sale of preferred shares in railway company	250
	1,220
Third year, 1926-1927	
From railways	550
From transport tax	290
From industries	250
From ordinary budget resources	110
	1,200
Fourth year, 1927-1928	
From railways	660
From transport tax	290
From industries	400
From ordinary budget resources	500
	1,750
Fifth year, 1928-1929 [normal annuity thereafter]	
From railways	660
From transport tax	290
From industries	300
From ordinary budget resources	1,250
	2,500

The payments during the third and fourth year were originally subject to contingent addition or reduction not exceeding 250,000,000 gold marks, depending upon the total yield of the assigned customs and taxes, but this was changed by an agreement (Sept. 8, 1926) between the German government and the Reparation Commission whereby a single definitive payment of 300,000,000 gold marks was to be made in installments after Aug. 31, 1927, thus increasing the annuity of the third reparation year (1926-1927) to 1,500,000,000 gold marks.

Germany punctually met all her obligations under the Dawes Plan and owing to the large percentage of payment made through deliveries in kind and the Franco-British import levies no considerable transfer of cash had to be made as between Germany and other countries. (On Dec. 13, 1925, S. Parker Gilbert, Agent-General for Reparation Payments, issued a voluminous report covering the first year of operation (Sept. 1, 1924-Aug. 31, 1925) under the new régime. Though recognizing that many difficulties remained to be overcome, Gilbert spoke optimistically of the maintenance of a balanced budget and a stable currency in Germany and of the restoration of German economy to a productive state. Payments and deliveries were moving regularly to the creditor powers, and the whole administration of the plan had gone forward on the basis of mutual faith and confidence. The Agent General's report to the Reparation Commission for the second year (1925-1926) was dated Nov. 30, 1926 (published December 5). Germany met nearly 54 per cent of her obligations by means of deliveries of material—one-third of which consisted of coal, coke, and lignite. With the smooth functioning of the plan, stated Gilbert, had occurred a notable change in the attitude regarding it: the German Nationalists who had opposed its adoption no longer indulging in the stinging criticism of it which was characteristic of the first year. Nevertheless, further progress depended upon unpredictable factors—not least upon developments external to Germany.

On October 20, 1927, Agent General Gilbert presented to the German government a memorandum (published November 6) in which he courteously but pointedly criticized certain features of Germany's financial policy. He charged that the German authorities instead of economizing were "developing and executing constantly enlarging programmes of expenditures and of borrowings," which not only jeopardized the fulfillment of the Dawes Plan but the whole economic structure of the Reich. Specifically, his main criticisms were: (1) Overloading and unbalancing the budgets with such items as pensions and increased salaries for government officials, compensation by German citizens whose property had been expropriated by foreign countries during the World War, and enlarged educational expenditures. (2) Increasing grants-in-aid made by the Federal treasury to the separate states and cities which had uncontrolled expenditures. (3) Undue expansion of credit by the Reichsbank leading to increasing costs of production and an excessive inflow of imports. (4) The adoption of financial measures tending to increase the cost of production and the cost of living. The German government replied in good temper asserting its intention of developing the productive resources of the Reich to full capacity, decrying any fear of an industrial or financial crisis, and defending itself in other respects. Nevertheless, the Gilbert memorandum, which was warmly endorsed by Dr. Schacht, president of the Reichsbank, dealt a devastating blow to the prestige of the Marx cabinet. See GERMANY.

The truth was that Gilbert was profoundly alarmed by the mounting volume of Germany's foreign loans. In all, between Sept. 1, 1924, and Aug. 1, 1927, Germany borrowed from abroad some \$1,172,675,000 including loans to the Reich, to the states, to municipalities, public utility companies, private firms, and church organizations. Conservative estimates assigned fully 70 per cent of this total to American investments. In other words, Germany's borrowings from abroad during three years' operation of the Dawes Plan exceeded her reparation payments to the Allies by approximately \$242,675,000. Dr. Schacht had already inaugurated a vigorous campaign to check the enormous inflow of foreign credits. Germany's international trade balance continued to be regularly adverse (e.g., about \$1,000,000,000 for the year 1927).

In his third annual report to the Reparation Commission (published Dec. 16, 1927), Mr. Gilbert took occasion to reiterate his previous remonstrance regarding Germany's administration of her finances. Though milder in tone than his previous memorandum, it nevertheless sternly insisted that the Reich retrench its expenditures and reform its financial arrangements with the federated states. Germany, he stated, had loyally fulfilled her obligations under the Dawes Plan—paying in cash or in kind the annuity of 1,500,000,000 gold marks. Two features of the report attracted world-wide attention. In the first place, the Agent General flatly denied the thesis advanced by certain American bankers that foreign loans for German private enterprises took precedence over reparation payments. Secondly, he intimated that the Dawes Plan was not conceived as final, but was intended only to operate over a period sufficient to restore confidence. "For," said he in conclusion, "as time goes on and practical experience accumulates,

it becomes always clearer that neither the reparation problem nor the other problems depending upon it will be finally solved until Germany has been given a definite task to perform on her own responsibility, without foreign supervision and without transfer protection." This, he asserted, was the principal lesson to be drawn from the three years' experience, and it should be constantly in the minds of all concerned as the execution of the plan continued to unfold. Many circles, including the French, interpreted these latter observations to mean that the Agent General regarded the review and revision of the whole reparation problem by international experts as essential as soon as the operation of the Dawes Plan should have been sufficiently tested to provide the necessary data.

During the summer of 1928 a truly remarkable change came over Premier Poincaré. Whether his long struggle for the financial salvation of France had acquainted his legalistic mind with the inexorable operation of economic forces or whether he was influenced by the more liberal views of his eminent colleagues, Briand and Herriot, it is difficult to say, but at any rate, he was apparently converted from his former intransigent attitude of demanding the last sou to the project of commercializing the German reparation obligations. Meanwhile, Germany began to press for the adjustment of the Rhineland and Saar Basin issues. Dr. Mueller, the new Chancellor, in his declaration of policy (July 3) to the recently elected Reichstag stressed Germany's desire for friendly understanding with foreign nations, her loyalty to the League of Nations, and her intention energetically to demand effective disarmament.

Referring to reparation, he praised the smooth working of the Dawes Plan, but asserted that conditions were ripe for a final settlement of the problem as foreseen by the experts. Germany stood ready to cooperate in every way. Developing discussion regarding the Rhineland question led to a special conference at Geneva, Sept. 11, 1928, attended by Chancellor Mueller of Germany, Lord Cushendun of Great Britain, Foreign Ministers Briand of France, Hymans of Belgium, Scialoja of Italy, and a Japanese representative, to work out preliminary plans. On September 16, an official communiqué announced that the conference had determined on: (1) the opening of official negotiations relating to the request put forward by the German Chancellor regarding the early evacuation of the Rhineland; (2) the necessity for a complete and definite settlement of the reparation problem, and for the constitution for this purpose of a committee of financial experts to be nominated by the six governments; and (3) the acceptance of the principle of the constitution of a committee of verification and cancellation. The composition, mode of operation, object and duration of the committee, to form the subject of negotiations between the governments concerned.

At last, the intolerable situation caused by the failure to determine the extent of Germany's obligations was recognized by the Allies. The palliative of the Dawes Plan had to be replaced by a sounder arrangement. France, for example, was hesitant to commit herself to ratification of her debt agreement with the United States (see above), because of her fear that the Dawes Plan might break down and German payments cease. Some \$400,000,000 worth of war supplies purchased from America

after the War had to be paid for by Aug. 1, 1929, if the Mellon-Bérenger pact (which provided for funding them with France's other indebtedness) should not be accepted by the French government. Britain stood square on the principle of the Balfour note of Aug. 1, 1922 (see above). The United States maintained its attitude of official unconcern, but its sanction would have to be sought should any plan be adopted for commercializing the industrial and railroad bonds of the Dawes régime, because the coöperation of Wall Street would be imperative.

During October, there was much hurrying to and from Europe of prominent leaders of international finance. On October 14, S. P. Gilbert, the Agent General for reparations payments, was in London discussing the situation with Prime Minister Baldwin, certain British financiers, and J. P. Morgan. Five days later, Winston Churchill, British Chancellor of the Exchequer, and Mr. Gilbert met Premier Poincaré in Paris and subsequently held conferences with M. Moreau, Governor of the Bank of France, Sir William Tyrrell, the British Ambassador, and J. P. Morgan. On October 23, Gilbert was in Brussels lunching with Premier Jaspar and exchanging views with Foreign Minister Hymans and Finance Minister Houtart. On October 25, the Agent General was in Berlin conferring with Chancellor Mueller, Finance Minister Hilferding, Herr Curtius, the Minister of Commerce, and Dr. Schacht, president of the Reichsbank.

On October 27, the German government took the initiative, formally proposing through the ambassadors in Paris, London, Rome, Brussels, and Tokio the formation of the committee of independent experts envisaged by the Geneva Resolution of September 16. For obvious reasons, no invitation was extended to the American government, though the participation of American experts was contemplated. From this time until the final appointment of the experts in January, the various governments spied for advantage, each trying to strengthen its own position. France, standing on the legality of the London Agreement of 1921 with its \$33,000,000,000 obligations, interpreted the Dawes Plan as a moratorium and alleged that, since Germany was even more deeply involved, she had no right to request French evacuation of the Rhineland. Germany, on the other hand, regarding the London Settlement as political rather than economic in origin, argued that the Dawes Plan had superseded it, and since Germany had faithfully lived up to her obligations under this régime, she had the right to demand French withdrawal from the Rhineland. Germany, however, had been able to meet the ruinous burden of Dawes payments only by continued borrowing from abroad and since further credit might not be available, she was anxious for a settlement, but unwilling to surrender the protection of the Dawes transfer system except for a price.

Early in November, 1928, Great Britain served notice on France, Belgium, and Italy that she expected preferential treatment with respect to German payments to make up the difference between what she had paid America (\$198,000,000) and what she had received from Germany and the three Allied States (\$83,000,000). The French challenged Britain's claim, saying that her seizure of German property during the War was greater than the deficit she now alleged. The British withdrew from their position. In December, Stresemann returned from the League

of Nations Council session at Lugano with assurances that as soon as the experts should have presented their report, the second zone of occupation on the Rhine would be evacuated, and that troops would be withdrawn from the third and last zone progressively with the commercialization of German reparations.

Substantial accord likewise was achieved as to points of procedure to be followed by the experts at their meeting and an agreement was reached to restrain the excessive flow of ultra-nationalistic domestic oratory that always had constituted such an impediment to successful negotiations. As if to create optimism regarding the hazardous and adventurous task of commercializing the German debt, Agent General Gilbert published (Dec. 28, 1928) his fourth annual report on the Dawes Plan stating that it had continued to operate successfully, that Germany had made all of her payments loyally and punctually and that the transfer system was in smooth running order.

Immediately thereafter, Mr. Gilbert visited the United States, presumably to help guide the selection and instruction of American experts, who then held extended conferences with President Coolidge and Secretaries Kellogg and Mellon. In the preliminary arrangements, Germany had insisted, in opposition to the French, that the delegates should not be bound by instructions from their respective governments. France gave way and it was solemnly announced that no instructions would be given. Nevertheless, in all of the countries involved, the governments stated both elaborately and definitely what their demands were to be. Each of the five Allied countries officially participating—namely, Belgium, Great Britain, France, Italy, and Japan—nominated two experts for appointment by the Reparation Commission; the German government appointed two experts; and the American experts were nominally appointed by the Reparation Commission conjointly with the German government but were really designated with the unofficial approval of the United States government. Each of the experts was empowered to appoint an alternate.

The membership of the committee embraced.

(a) Belgian experts—M. Émile Francqui, M. Camille Gutt, alternates—Baron Teirlinden, M. H. Fabry.

(b) French experts—M. Émile Moreau, M. Jean Parmentier, alternates—M. C. Moret, M. Edgar Allix.

(c) German experts—Dr. Hjalmar Schacht, Dr. A. Vogler, alternates—Dr. S. Melchior, Dr. L. Kastl.

(d) British experts—Sir Josiah Stamp, Lord Revelstoke, alternates—Sir Charles Addis, Sir Basil Blackett.

(e) Italian experts—Dr. Alberto Pirelli, M. Fulvio Suvich, alternates—M. Giuseppe Bianchini, M. Bruno Dolcetta.

(f) Japanese experts—Kengo Mori, Takashi Aoki, alternates—Saburo Sonoda, Yasumune Matsui.

(g) American experts—Owen D. Young, J. P. Morgan, alternates—Thomas N. Perkins, T. W. Lamont.

On February 9, the experts met at the Bank of France to discuss matters of organization and procedure. Two days later, the first regular session was held at the Hotel George V, and Owen D. Young (the real author of the Dawes Report) was unanimously chosen chairman. Five other experts also had served in the Dawes Committee of 1924. The committee stayed in almost continuous session over a period of some 17 weeks. Subcommittees were set up as required for the study of particular questions and met frequently in the intervals between plenary sessions. On the whole, there was real negotiation. The German delegates were treated with deference rather than hostility and good feeling gen-

erally prevailed. Nevertheless, a serious divergence of interest and viewpoint between Germany and the creditor nations produced periodical and prolonged deadlocks in the deliberations. Frequently, it seemed as though the committee would have to adjourn and report failure. Only the patience, resourcefulness, and diplomacy of Chairman Young served to prevent a disruption of the conference. The outcome represented real sacrifice on each side.

The salient features of the reparation plan embodied in the Young Report of June 7, 1929, may be summarized as follows:

(1) *German Annuity Payments.* The agreement provided for payments by Germany extending over a period of approximately 58 years to the year 1988. During the first 37 years, to Mar. 31, 1936, the annual payments would amount to a constant sum of 1,988,800,000 gold marks plus interest and sinking fund charges on the Dawes Plan loan of 1924 which would gradually increase the annuities to more than 2,400,000,000 marks, or an annual average for the period of 2,051,000,000 marks (\$488,138,000). Thereafter, the payments would average 1,650,000,000 marks annually for 18 years, and finally three years averaging slightly more than 900,000,000 marks. The present worth, or immediate cash value, of these scheduled annuities aggregated about 37,000,000,000 gold marks or approximately \$9,000,000,000, a sweeping reduction from the 133,000,000,000 gold marks of the London "settlement" of 1921 and a substantial cut from the 44,000,000,000 marks of the Dawes Plan of 1924. All German government obligations arising from the War were to be covered by these payments—various miscellaneous treaty claims and counterclaims in connection with property rights to be wiped out.

(2) *Division of Receipts among Creditor Nations.* No essential modification was proposed. For the first 37 years, the proceeds were to be distributed as indicated in the following table (in annual averages)

	Marks	Dollars
France	1,046,500,000	249,067,000
Great Britain	409,000,000	97,342,000
Italy	213,700,000	50,860,600
Belgium	115,500,000	27,489,000
Jugoslavia	84,000,000	19,992,000
Rumania	20,100,000	4,783,800
Greece	7,000,000	1,666,000
Portugal	13,200,000	3,141,600
Japan	13,200,000	3,141,600
Poland	500,000	119,000
United States	66,500,000	15,827,000
Service of the Dawes Loan	61,800,000	14,708,400
Total	2,051,000,000	488,138,000

The American share consisted of 40,000,000 marks for mixed claims and 26,500,000 marks for meeting the costs of the Army of Occupation. After the 37 years shall have elapsed, the United States is to continue to receive annual installments of 40,800,000 marks for 15 years longer.

(3) *Deliveries in Kind.* Payments in the form of direct shipments of goods to the creditor countries were to be reduced gradually from 750,000,000 marks to 300,000,000 and to close after 10 years. Thenceforward, unless special arrangements for continuing such direct payments should be voluntarily made by interested parties, all payments would have to be made in foreign exchange secured by Germany as a result of ordinary trade and financial transactions.

(4) *Two Types of Annuities—Unconditional and Postponable.* Annual installments due should be divided into two parts—660,000,000 gold marks to be an *unconditional* obligation of which France should receive 500,000,000 marks and the balance subject to postponement under certain conditions. The German government was accorded the right on giving three months' notice to suspend payments of any portion of the *conditional* obligations for not more than two years, but all such postponed payments were to remain unconditional ultimate obligations. This provision was merely designed to obviate temporary exchange difficulties, and not to permit any permanent scaling down of obligations if future economic developments should show Germany's capacity to pay to be less than had been anticipated.

(5) *Commercialization Provision.* The Young Plan made partial provision for the commercialization of German reparation obligations. The creditor governments, whenever they judged the conditions of the world investment markets to be opportune, might ask the German government to create bonds representing the whole or any part of the capitalized value of the 660,000,000 marks of annual unconditional payments, or a maximum of 11,000,000,000 marks of bonds. It was not contemplated with such a huge total should be floated in any one year and indeed it was regarded as possible that a substantial portion might never be used. This 11,000,000,000 marks of potential bonds was the exact equivalent of the railroad bonds deposited with the trustee appointed by the Reparation Commission under the Dawes Plan. Nevertheless, these marketable bonds were not hypothecations of railroad property but were to be the direct and unconditional obligation of the German government. The industrial debentures of the Dawes régime were not retained.

(6) *The International Bank.* By far the most interesting and constructive feature of the Young Report was the recommendation that an internationally organized and controlled bank should be established. The new bank was to provide the necessary machinery for administering reparation payments and offering additional protection against temporary foreign exchange difficulties. The capital stock of \$100,000,000 was to be allocated with a view to enlisting the financial interest of the countries involved in the reparations agreement. The bank was to have a board of directors consisting of the governor, or chief executive officer, of the central bank of each participating country and an additional member appointed by each of the foregoing to represent the interest of finance and industry. (The governors of the Bank of France and the Reichsbank were each to be allowed an extra appointment). This group of directors would then select not more than nine additional directors from lists submitted by the various central-bank governors. Thus, the management of the system was to be thoroughly international in character. The International Bank was to have the following functions and powers. (a) It would replace the office of the agent general for reparation payments and would receive all payments from Germany and make the necessary disbursements to the various creditor governments. (b) It might make loans to Germany to meet temporary emergencies and invest funds, temporarily undisbursed, within Germany. (c) It might facilitate payments in kind by short-term loans to purchasers of such commodity de-

liveries. (d) It would have charge of the flotation of such bonds as might be commercialized. (e) With the aid of a special advisory committee, the bank would safeguard the interests of the creditor countries in the event that Germany should ask for a postponement of the conditional part of the annuities. (f) It might receive deposits from, and make loans to, the various central banks, and also buy and sell gold coin and foreign exchange. (g) It might buy and sell intermediate or long-term securities on its own account, and might issue its own obligations, long-term or short-term, secured or unsecured, for the purpose of relending the funds thus obtained to central banks. (h) It might make loans to facilitate trade expansion, not only for Germany but for the world generally, particularly by financing the construction of public works and industries in undeveloped regions. (i) Finally, the bank was expected to develop eventually into a world clearing house for central banks, thus eliminating the necessity of shipping gold in the settlement of international transactions.

(7) *Relation to Inter-Allied Debts.* Though as usual precluded from definite consideration of the relation between German reparations and inter-Allied debts by the official policy of the United States government in declaring them to be legally separate and distinct questions, the Young Committee in fact evolved a plan that tied them up together in realistic accordance with the fact that economically, if not diplomatically, they had always been inextricably connected. For one thing, the time period over which reparations payments were to be made coincided quite closely with that during which inter-Allied obligations were to be discharged. Moreover, the annuities of the respective schedules during later years closely approximated each other. Most significant of all, however, was a special memorandum signed concurrently with the Young Report proper by the experts of France, Great Britain, Italy, Belgium, and Germany, recommending that if reparation creditor countries received any future relief in their out payments (i.e., then inter-Allied debt obligations), Germany should be granted a reduction equal to two-thirds the amount thereof during the first 37-year period and equal to the whole amount during the last 22 years. Should America ever consent to modify her debt settlement agreements, a substantial benefit therefrom would be passed on to Germany by her creditors. Without this possibility of ultimate relief, it is extremely doubtful whether the German experts would have consented to sign the Young Reparation Report.

This was a far cry from the fantastic and extravagant claims and proposals of 1918-19. The vindication of the courageous John Maynard Keynes and the few other far-sighted economists of the Paris Peace Conference could not have been greater. Whether the statesmanlike programme outlined by the Young Committee would be accepted by the governments concerned remained to be seen. Though American citizens had contributed greatly to the formulation of the plan and would doubtless participate in the future management of the new international financial system if adopted, the United States government officially maintained its attitude of aloofness, presumably being content as in other similar undertakings to accept the benefits without assuming any formal obligation. Upon Briand, who after the ratification of the Franco-

American debt settlement succeeded Poincaré as Premier of France on July 28, 1929, Stresemann, the long-tried Foreign Minister of Germany, and MacDonald, the more recently reinstated Labor Prime Minister of Great Britain, would rest primary responsibility for overcoming divergencies of national interest and principles to assure its success. With reparations and inter-Allied debts in a fair way to ultimate liquidation, attention might then be concentrated upon invigorating the League of Nations and seeking a solution of the fundamental human problem of promoting and attaining the realization of international arbitration, security, and disarmament.

Bibliography. The following list gives the more important of the works covering the subject of reparations: R. S. Baker, *Woodrow Wilson and World Settlement*, 3 vols. (Garden City, N. Y., 1922); Carl Bergman, *The History of Reparations* (London, 1927); E. M. House and C. Seymour, editors, *What Really Happened at Paris* (1921); C. P. Howland, *American Foreign Relations, 1928* (New Haven, 1928); J. M. Keynes, *The Economic Consequences of Peace* (New York, 1920); and *The Revision of the Treaty* (New York, 1922); H. G. Moulton, *The Reparation Plan of the Dawes Committee* (New York, 1924); and Moulton and C. E. McGuire, *Germany's Capacity to Pay* (New York, 1923). For text of the Young Plan adopted by the Experts Committee on Reparations, see *Current History*, vol. xxx, no. 4, July, 1929, p. 724 et seq. See also Robert R. Kuczynski, *American Loans to Germany* (New York, 1927); H. G. Moulton and Leo Pasvolzky, *World War Debt Settlements* (New York, 1926); and Max Sering, *Germany under the Dawes Plan* (London, 1929), which is politically biased but offering a sound and brilliant economic analysis.

RESEARCH COUNCIL, NATIONAL. A scientific organization established in 1916 by the National Academy of Sciences at the request of the President of the United States and continued under the charter of the Academy by an executive order of the President in 1918. Its purpose is the encouragement of scientific research and the dissemination of scientific knowledge for the benefit of the national strength and well-being. It is organized in 12 divisions, arranged in two groups, one of which comprises seven divisions of science and technology, the other comprising five divisions of general relations as follows: State relations, educational relations; foreign relations; government relations; and research information. The council has the formal recognition and cooperation of 75 major scientific and technical societies throughout the United States, and its membership is composed largely of appointed representatives of these societies.

Since the close of the World War, financial support has been derived from a gift of \$5,000,000 from the Carnegie Corporation of New York to the National Academy of Sciences and from gifts from various individuals and industrial concerns and from the Rockefeller Foundation, the General Education Board, International Education Board, Laura Spelman Rockefeller Memorial, and Commonwealth Fund. Part of the appropriation from the Carnegie Corporation was used for the erection of a building for the joint use of the National Research Council and the Academy of Sciences located at B and 21st streets, N. W., Washington, D. C., completed

in 1924. The council maintains two regular series of publications: *Bulletins*, of which 66 had been issued up to the end of 1928, and the *Reprint and Circular Series*, of which 86 had appeared; and in addition, miscellaneous publications and an *Annual Report*. The chairman of the council for 1928 was George K. Burgess; the permanent secretary, Dr. Vernon Kellogg.

RESERVOIRS. See **DAMS; FLOODS AND FLOOD PROTECTION**.

RESINS. See **CHEMISTRY, APPLIED**.

RESPIGHI, OTTORINO (1879-). An Italian composer, born at Bologna. He received his musical education there at the Liceo Musicale under F. Sarti (violin) and G. Martucci (composition) and was professor of composition there from 1913 to 1919. In 1919-25 he was director of the Liceo Santa Cecilia in Rome. In 1928 he made a tour of the United States as pianist and guest-conductor of several of the great symphony orchestras. His works comprise the operas, *Rè Enzo* (Bologna, 1905), *Scmiràma* (ib., 1910), *Belfagor* (Milan, 1923); *La Campana Sommersa* (Hamburg, 1927; New York, 1928), a puppet play, *La Bella Dormiente nel Bosco* (Rome, 1922), for orchestra, *Sinfonia Drammatica*, *Danza delle Gnomidi*, *Notturmo*, *Burlesca*, two orchestral suites, *Rossiniana* and *Vetrare di Chiesa*; the symphonic poems, *Fontane di Roma*, *Pini di Roma*, *Festa Romana*, *Nerone*; *Concerto Gregoriano*, for violin and orchestra; a piano concerto; *Toccata*, for piano and orchestra, a cantata, *Arctusa*, two string quartets; a violin sonata, and pieces for piano, for organ, and for violin. He brought out a critical edition of Monteverde's *Lamento d'Arianna*.

RETHBERG, ELISABETH (1894-). Stage name of Elisabeth Sattler, a German coloratura and dramatic soprano, born at Schwaizenberg, Saxony. She studied piano and singing at the Royal Conservatory in Dresden, and made her debut in Johann Strauss's *Der Zigeunerbaron*, in 1911. In 1915 she became a member of the Royal Opera at Dresden, where she rapidly rose to prominence through her versatility and extraordinary vocal histrionic ability. She remained there until 1922, when she came to the Metropolitan Opera House, New York. Since her American debut as Aida (November, 22), she has been one of the stars of first magnitude. In the summers of 1926 and 1927, she sang with the Ravinia Park Opera in Chicago. She also made extended concert tours throughout the United States. Richard Strauss chose her to create the title rôle in his latest opera entitled, *Die ägyptische Helena* (Dresden, June 6, 1928).

RÉUNION. An island possession of France in the Indian Ocean, 420 miles east of Madagascar. Area, 970 square miles; population (1926), 186,637, made up as follows: 180,694 of French origin, 628 British Indians, 1626 Chinese, and several hundred Africans and Arabians. Chief towns are St. Denis, the capital, 23,390 inhabitants; St. Pierre, 20,479; St. Paul, 21,643. Chief products are sugar, rum, coffee, manioc, tapioca, vanilla, and spices. Chief exports are sugar (50,122 metric tons in 1927) and rum (1,202,298 gallons). The advances made by the colony may be gauged from the following trade figures: exports for 1913 and 1927, 16,592,000 francs and 146,991,441 francs; imports for same years, 24,935,000 and 173,640,398. Chief imports are food-

stuffs and cotton goods. The 1927 budget showed revenues of 51,799,299 francs and expenditures of 48,759,085 francs.

REUTER, roi'tër, GABRIELE (1859-). A German novelist and essayist (see VOL. XIX). The success of her early novel, *Aus Guter Familie*, an eloquent plea for a broader life for the unmarried daughters of the German middle class, gave her a prominent rank among women writers of her country. She resided for some years in Switzerland, but later returned to Berlin and published *Das Neue Land* (1916); *Die Jugend einer Idealistin* (1917); *Das Herrin* (1918); *Grossstadtmädel* (1919); the autobiographical *Vom Kinde zum Menschen* (1921); *Benedikta* (1923); and *Tochter* (1926).

REVENTLOW, rä'vënt-lō, ERNST, COUNT (1869-). A German journalist (see VOL. XIX), who contributed largely to the war literature of his country. After 1924 he was a member of the Reichstag representing the National Socialist Labor Party, and editor of the weekly, *Der Reichswart*. Among his later works were: *Der Vampyr des Festlandes* (1914); *Heucheleien Britischer Minister* (1915); *Der Einfluss der Seemacht im Grossen Kriege* (1917); *Die Politische Vorgeschichte des Grossen Krieges* (1918); *Das Diplomatische Vorspiel des Grossen Krieges* (1920); *Grundlinien einer deutschen Aussenpolitik* (1928); and *Monarchie* (1928).

REVERSION. See HEREDITY

REY, ABEL (1873-). A French professor of philosophy, born at Chalon-sur-Saône, and educated at the Sorbonne. He taught philosophy at the lycées of Bouget and Beauvais, with the faculty of letters of the University of Dijon, and finally at Paris. He was best known as a philosopher of natural science and as the author of *La Théorie de la physique chez les physiciens contemporains et le mécanisme* (1907). His other works include *Leçons de psychologie et de philosophie*; *La Philosophie moderne* (1908); *Les Sciences philosophiques, leur état actuel, and Le retour éternel et la philosophie de la physique* (1927).

REYMONT, LADISLAS STANISLAW (1868-1925). A Polish novelist, born in Kobjelie Wielkie, Russian Poland, who died at Warsaw. He received the Nobel Prize for literature in 1924, presumably for his four-volume work *The Peasants* (1904-10). His other works, with their German titles, include *Das gelobte Land* (1898); *Der Sonnenaufgang* (1902); *Der Letzte polnische Reichstag* (1917), and *Gies Werke* (7 vols., 1919-22).

REYNOLDS-STEPHENS, WILLIAM (1862-). A British sculptor, born in Detroit, Mich., of British parents, and educated at Blackheath, England, in Germany, and at the Royal Academy School. He has exhibited at the Royal Academy each year since 1886 and in 1921-28 was president of the Royal Society of British Sculptors. His chief works are "The Scout in War"; "A Royal Game: Queen Elizabeth and Philip II," purchased by the Chantry bequest for the National Collection; "Love's Coronet"; "Castles in the Air"; "Guinevere's Redeeming"; and various portrait statuettes. He also has painted "Love and Fate," "Summer," and other pictures, executed memorials to Sir William Q. Orchardson in St. Paul's Cathedral and Canon Brooke and others in Southwell Minster, and designed and executed the interior decorations for a number of churches.

RHENÉ-BATON (1879-). A French conductor and composer, born at Courseulles-

sur-Mer in Calvados. Having studied piano with private teachers, he attended for two years the advanced class of C. de Bériot at the Paris Conservatoire and then studied composition as a private pupil of A. Gédalge. After one year as chorus-master at the Opéra Comique, he became conductor of the Concerts Populaires d'Angers, then of the Concerts Durand, and later of the Société Sainte-Cécile at Bordeaux. He directed the concerts at the Kursaal in Scheveningen in 1914-19 and in 1919 became conductor of the Concerts Pasdeloup in Paris. In 1910 he conducted a festival of French music in Munich and in 1915 a similar festival in Rome. In the spring of 1914, he was conductor of a season of Russian opera in London. His compositions include *Variations* for piano and orchestra, the orchestral works *Prélude et Fugue*, *Menuet pour Monsieur*, and *Frère du Roy*; a suite, *Fresques Antiques*; a violin sonata, and interesting piano pieces and songs. A ballet and an opera were still in manuscript and not yet produced in 1929.

RHENISH REPUBLIC. See GERMANY; RHINELAND.

RHINELAND. The French policy at the Peace Conference, as represented by Premier Clémenceau and Marshal Foch, was to make the Rhine the western frontier of Germany and either to annex the left bank of the Rhine, i.e., the greater part of the Prussian Rhine Province, all of the Rhenish Palatinate, and part of Hesse-Darmstadt, or to set up this territory as a nominally independent but actually French-controlled republic, on the ground that such action was essential to the safety of France and Belgium. When this plan was wrecked by the opposition of Premier Lloyd George and President Wilson, a compromise was arranged whereby the left bank of the Rhine was to be occupied for 15 years by the Allied Powers; evacuation on the expiration of this term was to be dependent on two conditions, the complete fulfillment of the treaty by Germany, and the agreement among the Allies that "the guarantees against unprovoked aggression by Germany are considered sufficient by the Allied and Associated Powers." That these two clauses nullified the 15-year provision and left it to France's discretion to decide when the occupation should terminate has been sufficiently demonstrated by the declarations of the successive French governments that France did not consider the 15-year provision as having begun to go into operation. See historical sections of FRANCE and GERMANY; REPARATIONS.

RHODE ISLAND. The forty-eighth State in size (1248 square miles) and the thirty-eighth in population, capital, Providence. The population increased from 542,610 in 1910 to 604,397 in 1920, a gain of 11.4 per cent, estimated population, 1928, 716,000. The white population increased from 532,492 (1910) to 593,080 (1920); Negro, from 9529 to 10,036; native white, from 354,467 to 420,481. Foreign-born whites decreased in number from 179,025 to 173,499. The urban population mounted from 524,654 to 589,180, while the rural decreased from 17,956 to 15,217. The growth of the principal cities was as follows: Providence (qv), from 224,326 in 1910 to 237,595 in 1920; Pawtucket, 51,022 to 64,248; Woonsocket, 38,125 to 43,396; Newport, 27,149 to 30,256.

Agriculture. Rhode Island, in common with most of the Eastern States, has undergone a con-

siderable decrease in all phases of agriculture. The number of farms decreased 22.8 per cent, or from 5292 in 1910 to 4083 in 1920, and fell farther to 3911 in 1925; the total acreage in farms decreased from 443,308 (1910) to 331,600 (1920) and 309,013 (1925). The improved land in farms totaled 132,855 in 1920. The percentage of the total land area used for agricultural purposes decreased from 64.9 in 1910 to 48.6 in 1920 and 45.3 in 1925. The total value of farm property rose from \$32,990,739 in 1910 to \$33,036,766 in 1920, and was \$33,446,425 in 1925; the average value per farm rose materially from \$6234 in 1910 to \$8238 in 1920, and farther, to \$8552 in 1925. In interpreting these values, the inflation of currency incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 3263 were operated by owners; 176, by managers; and 472, by tenants. The corresponding figures for 1910 were 4087, 251, and 954. White farmers in 1920 numbered 4063, of whom 3123 were native and 940 were foreign born. There were 19 Negro farmers and one Indian farmer in 1920. Farms reported as under mortgage numbered 949 in 1920; 946 in 1925. There were 24,914 dairy cows in 1920; 21,961 in 1925, "beef" cows numbered 1001 in 1920; 143 in 1925; sheep, 2736 in 1920, 1897 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 390,000 bushels, potatoes, 244,000, apples, 230,000, and hay, 69,000 tons. Comparative figures for 1913 are corn, 402,000 bushels; potatoes, 650,000, hay, 68,000 tons.

Manufactures. Although one of the smallest States in area and population, Rhode Island is important industrially. There were 11 cities with more than 10,000 inhabitants in 1920 and these formed 83 per cent of the total population of the State. They reported 82.7 per cent of the value of the State's manufactured products in 1919. There were 1951 manufacturing establishments in the State in 1909; 2466 in 1919; 1595 in 1925; and 1497 in 1927. Wage earners in manufactories numbered 139,665 in 1919; 120,346 in 1925; and 120,009 in 1927. Capital invested amounted to \$290,901,270 in 1909 and \$594,337,448 in 1919. The value of the products was \$280,343,797 in 1909; \$747,322,858 in 1919; \$621,919,637 in 1925; and \$592,232,647 in 1927. The increase in the value of products evidenced in 1919 was partly due to changes in industrial conditions brought about by the World War; but there has been a substantial growth in the manufacturing activities of the State. A leading industry is the manufacture of cotton goods. This produced \$50,313,000 in 1909, \$177,423,000 in 1919; \$128,526,645 in 1925; \$90,053,620 in 1927. The manufacture of woolen and worsted goods produced \$74,600,000 in 1909; \$175,312,000 in 1919; \$146,645,564 in 1925, \$137,566,176 in 1927. The manufacture of jewelry amounted to \$20,685,000 in 1909; to \$21,522,000 in 1914; to \$48,596,000 in 1919; and to \$35,451,319 in 1927. The principal manufacturing cities are Providence, Pawtucket, and Woonsocket. There were 1080 manufacturing establishments in Providence in 1909, with a product valued at \$120,241,000, 1274 in 1919, with \$267,629,000, products in 1925 attained \$212,118,000. Pawtucket had 217 manufacturing establishments in 1909, with products valued at \$37,696,000; 235 in 1914, with \$42,029,000; and 284 in 1919, with \$135,518,000. Similar

figures for Woonsocket are 130 in 1909, with \$28,219,000; 157 in 1914, with \$28,115,000; and 190 in 1919, with \$93,647,000. Other important manufacturing cities are Newport, Central Falls, Cranston, Cumberland, and East Providence.

Education. Educational progress in Rhode Island has been well sustained. The public-school system includes elementary and secondary schools, established, maintained, and supported by towns and cities; and two colleges, Rhode Island State College, supported by the Federal government and by the State, and Rhode Island College of Education, the principal function of which is the training of teachers. The State also provides free State scholarships for vocational courses at the Rhode Island School of Design and the Rhode Island College of Pharmacy, and for teachers' training in the Graduate Department of Education at Brown University. Nearly 90 per cent of Rhode Island teachers are normal-school or college graduates, and many of the teachers are enrolled in summer schools or extension courses. The State maintains a pension system for teachers, to which all employed in public education are eligible. Progress has been effected in the establishment of evening schools maintained by towns and cities. Vocational instruction in these schools had an intensive development, the work being very closely related to the predominant State industries. The total enrollment in public schools in the academic year 1925-26 was 111,428, of this total, the kindergarten and elementary grades furnished 96,486 and the secondary grades, 14,942. The percentage of illiteracy in the State decreased from 9.2 in 1910 to 8.2 in 1920; among the native white population from 0.9 to 0.6, among the foreign-born white, from 18.1 to 17.5. Among the Negroes illiteracy increased from 11.4 to 12.5 per cent.

Finance. State expenditures in the year ended Nov. 30, 1928, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$6,538,951 (of which \$470,472 was aid to local education), for conducting public-service enterprises, \$17,036; for interest on debt, \$861,985, for permanent improvements, \$5,615,826; total, \$13,033,798 (of which \$4,099,746 was for highways, \$850,535 being for maintenance and \$3,249,211 for construction). Revenues were \$11,573,300. Of this, property and special taxes formed 43.3 per cent, departmental earnings and charges for officials' services, 5.1 per cent; sales of licenses and taxation of gasoline, 40 per cent. Property valuation was \$1,344,644,741; State taxation thereon, \$1,613,454. Net State funded debt on Nov. 30, 1928, was \$21,874,000.

Political and Other Events. In 1914 R. L. Beeckman, Republican, was elected governor, and was reelected in 1916 and 1918. The Democrats elected a Representative to Congress in one district and the Republicans in two. Charge of corruption and bribery in this election were made and investigations were carried on in 1915 by the Federal Department of Justice. Peter G. Gerry, Democrat, was elected United States Senator in 1916 and reelected in 1922. For President, in 1916, Hughes received 44,858 votes; Wilson, 40,394 votes. In 1918 the Republicans reelected Senator LeBaron B. Colt, together with the entire State ticket, and the three Representatives in Congress. The Republicans elected the governor, Emery J. San Souci,

and the other State officers in 1920. Harding, for President, received 107,463 votes; Cox, 55,062. In 1922 the Democrats made almost a clean sweep of State offices; William S. Flynn was elected governor. In 1924 and 1926 Aram J. Pothier, Democrat, was elected governor and died in office Feb. 4, 1928, Norman S. Case succeeding. In 1924 the presidential vote was: Coolidge, 125,286; Davis, 76,606. In 1928, it was: Smith, 118,973; Hoover, 117,522. Case was reelected governor by the Republican vote in 1928, and Felix Hebert, Republican, was elected United States Senator.

Legislation. The Legislature of 1916 authorized the organization of cooperative agricultural associations. The laws relating to taxation were amended and so were the banking laws. In 1919 the Legislature amended the corporation-franchise tax. It changed the title, Commissioner of Industrial Statistics, to Commissioner of Labor and made provisions for a State Board of Labor. It passed measures for protection against anarchy and incitement to violence. The workmen's compensation law of 1912 was amended. In 1920 the Legislature revised the State corporation law and authorized a soldiers' bonus; in 1921 it amended the corporation laws and the laws relating to the administration of the State, provided for vocational rehabilitation, made appropriations for the aid of discharged soldiers and sailors out of employment, debarred women from serving on juries, increased the benefits to employees under the workmen's compensation law, adopted "blue sky" laws, and made all women subject to the poll tax of \$1 per annum. A prohibition enforcement act was passed in 1922. The Legislature of 1923 regulated the sale of coal, created a system of mothers' pensions, amended the child-labor laws, and passed a measure forbidding anonymous campaign publications. In 1924 the Legislature was deadlocked because of a filibuster by Senate Democrats. Republican members absented themselves and so prevented a Senate quorum. The filibuster was designed to compel submission to a proposal to hold a convention to revise Senate apportionment as provided in the State constitution. Republicans had a Senate majority in 1925, but in 1926 amendment resolutions were passed to increase the numbers of State Senators from Providence and other centres and to abolish the property qualification for voting in the cities.

RHODES. See DODECANESE

RHODESIA, NORTHERN. A British African protectorate, under the administration of the British South African Company until 1924. It has an area of 287,950 square miles and an estimated native population of 1,237,486. Whites in 1927 numbered 7275 (in 1911, 1947). The leading activities are stock raising, cereal culture, and lead mining. The mineral production in 1927 was valued at £360,337. Exports in 1927 were £777,890, as compared with £107,000 in 1911. Imports in 1927 were £2,030,599, chiefly from the United Kingdom. Southern Rhodesia, and the Union of South Africa. Revenues increased from £116,000 in 1911-12 to £474,683 in 1927-28; expenditures from £190,000 to £518,666. On Apr. 1, 1924, the protectorate was taken over by the British authorities and the typical government of a crown colony was established, in which a governor, executive council, and legislative council exercised appropriate functions.

RHODESIA, SOUTHERN. A British South African protectorate, up to 1923 under the administration of the British South Africa Company, but since then a self-governing colony under the British Crown. It has an area of 149,000 square miles and a native population of 950,638 (in 1927). Europeans numbered 41,024 in 1926 against 2912 in 1911. Chief towns, with white populations in 1926: Salisbury (7324), Bulawayo (8251), Gwelo (1148), Umtali (1874). Minerals continue to occupy the most important place in the colony's economic scheme. The gold yield in 1927 was valued at £2,458,862. Silver in 1927 yielded £20,234, coal, £324,511; copper, £109,343; chrome ore, £337,317; asbestos, £766,381. The total 1927 mineral output was valued at £4,238,257. To the end of 1925, total gold output was valued at £63,001,374. Agriculture is flourishing with 267,400 acres under maize in 1927. Tobacco and fruit orchards are being developed. In 1920 an important dam capable of holding 4,000,000,000 gallons, was completed across the Mazoe River. Cattle raising was taken up by the Europeans during the period 1912-22 and by 1920 their herds outnumbered the native stocks. Exports in 1925 were valued at £7,444,000, as compared with £2,812,000 in 1910. Leading exports are gold, copper, asbestos, chrome ore, tobacco, live stock. Imports in 1927 were valued at £7,574,000, as compared with £2,786,000 in 1910. Most of the imports come from the United Kingdom and the Union of South Africa. For administrative purposes, revenues were £773,000 in 1910-11, and in 1926-27, £2,009,600, expenditures £2,633,100. The net amount of the public debt outstanding Mar. 31, 1928, was £4,095,000. There were 2462 miles of railways at the end of 1927.

History. Before the Crown took over the territory, the British South Africa Company's sovereignty was continually challenged by the white settlers. The company was compelled to enlarge the number of elective members of the Legislative Council, so that by 1922, 13 members were being elected and 6 appointed by the company. Two bodies of opinion arose out of the World War, one favoring incorporation in the Union of South Africa, and the other self-government under the Crown. The latter was victorious in the general election of 1920 and was reaffirmed by the voters in a referendum held in October, 1922. Union with South Africa was rejected principally because of the ascendancy of the Dutch Nationalists in the Union, the Rhodesians fearing submergence at the hands of a non-British population. One of the leading points of contention during the period was the ownership of the unalienated lands. In 1918 possession of these lands was denied the South Africa Company, although it was admitted the company had to be compensated for the deficits it had met in the territory's expenditures. In 1920 a commission fixed this at some £4,000,000 for Southern Rhodesia. In Northern Rhodesia, the deficit was about £1,250,000. The Company, however, was recognized in its exclusive rights to the mineral lands. On July 28, 1923, the rule of the chartered company terminated when the Legislative Council sat for the last time and the company's claims were settled. On Sept. 12, 1923, it was announced that Southern Rhodesia's status was that of a self-governing colony and on October 1, a new form of government established under a governor assisted by an executive council and a legislature. In

July, 1928, the franchise was extended to all British subjects over 21 years of age and to married women.

RHODES SCHOLARS. See **UNIVERSITIES AND COLLEGES.**

RHONDDA, DAVID ALFRED THOMAS, FIRST VISCOUNT (1856-1918). British colliery owner and food controller in the World War, born in Aberdare, Wales, and educated at Caius College, Cambridge. Soon after leaving college (1886), he became prominent in the Welsh coal fields and in Liberal politics. He was elected to Parliament in 1888, and remained a member for 22 years. His sympathy with the miners made him a leader in industrial circles in South Wales. Shortly after the outbreak of the World War, he went to America to negotiate war contracts and later to systematize the munitions supply for the British government. In 1917, at Lloyd George's urgent request, he accepted the post of Food Controller, and administered that office with conspicuous success. He was created a viscount a month before his death.

RHÔNE CANAL. See **CANALS.**

RICE, ELMER L. (1892-) An American playwright, born in New York City, who graduated *cum laude* from the New York Law School. He wrote, among other successful plays, *On Trial* (1914); *The Iron Cross* (1917); *For the Defense* (1919); *Wake Up Jonathan*, with Hatcher Hughes (1921); *It is the Law* (1922); *The Adding Machine* (1923); *Close Harmony* (1924); *Cock Robin* (1927), and *Street Scene*, which won the Pulitzer Prize for the best play of 1928. *The Adding Machine* is an expressionist play put on in New York by the Theatre Guild in 1923 and since produced throughout the United States and in Europe as well.

RICE INSTITUTE. A coeducational institution for higher education at Houston, Texas, founded in 1912. The enrollment increased from 384 students in 1914 to 1303 in the autumn of 1928, and the faculty from 40 members to 87. Eleven scholarships were endowed, and a resident lectureship in civics and philanthropy established in 1912 through private support. In 1920 and 1922, similar provision was made for annual lectureships in public affairs and music. The construction of a new chemistry laboratory to cost in excess of \$600,000 was begun in 1923 and completed in 1925. The library contained about 70,000 volumes in 1928. President, Edgar Odell Lovett, Ph.D., LL.D.

RICHARDS, THEODORE WILLIAM (1868-1928). An American chemist (see VOL. XIX). In 1916 he became a member of the National Research Council and allied committees, and he served as consulting chemist to the War Department and Bureau of Mines in 1918. In recognition of his later achievements in chemistry, he was awarded the Nobel Prize in chemistry (1914), the Franklin Medal (1916), and the Lavoisier and Le Blanc Medal (1922). He became president of the American Chemical Society (1914), the American Association for the Advancement of Science (1917), and the American Academy of Arts and Sciences (1919-21). He was made an officer of the French Legion of Honor in 1925. In his later years, Professor Richards busied himself with the significance of changing atomic volumes, and of other effects of internal cohesive and chemical pressure. Thermochemistry and electrochemistry also occupied him increasingly. He wrote many papers on atomic weights and other subjects.

RICHARDSON, ERNEST GLADSTONE (1874-). An American Methodist Episcopal bishop, born at St. Vincent in the West Indies, and educated at Dickinson College and Yale University. In 1896 he was ordained to the Methodist Episcopal ministry and was a pastor of churches in Wallingford, Conn., and New York City until 1920, when he was elected bishop. Bishop Richardson was trustee of Clark University and several other educational institutions.

RICHARDSON, OWEN WILLANS (1879-). An English physicist (see VOL. XIX). He was Wheatstone professor of physics in King's College, University of London (1914-24), and director of research in physics there and Yarrow research professor of the Royal Society (1924-). He was awarded the Hughes Medal of the Royal Society in 1920, was president of Section A of the British Association in 1921, and president of the Physical Society in 1926-28. His later works include *The Emission of Electricity from Hot Bodies* (1916, 2d ed., 1921), and numerous articles on theoretical and experimental physics.

RICHEL, rê'shâ', CHARLES (1850-). A French physiologist (see VOL. XIX). Professor Richet published the following works after 1914: *War Nursing* (English trans., 1918); *L'Homme Stupide* (1919); *Traité de Physiologie Médico-chirurgicale*, with Charles Richet, Jr. (1921); *Traité de Métapsychique*, an important work on the occult (1922), translated into English as *Thirty Years of Psychical Research* (1923); *L'œuvre de Pasteur* (1923); *L'homme impuissant* (1926, English trans., 1928); *Histoire naturelle d'un savant* (also in English, 1927); *L'Intelligence et l'Homme* (1927).

RICHMOND. The capital and largest city of Virginia. The population rose from 130,833 in 1910 to 171,677 in 1920 and to 194,400 in 1928, by estimate of the U. S. Bureau of the Census. In 1919, by amendment of the city charter, the mayor, instead of the bicameral council, was authorized to appoint the heads of the following departments: public safety, public works, public welfare, and public utilities. The city controller and city attorney are elected by the voters. An advisory board was created and a city-planning commission appointed. In 1927 the United States Congress authorized a new survey of the James River which will result in deepening the 18-foot channel and eliminating several bends in the river, thereby reducing the distance to the sea by more than 10 miles. The city has pledged itself to an improvement programme which will cost more than \$3,000,000 to match the congressional appropriation. The first unit of the new city wharf, costing approximately \$100,000, has been completed.

Richmond is the leading industrial and financial centre of the South Atlantic States. In 1928, 32,900 persons were employed in its 621 industrial establishments and received \$29,162,-621 in wages, the value of products manufactured was \$248,959,716. The manufacture of tobacco in all forms is the principal industry, while the city's large business in printing and publishing, slaughtering and meat packing, locomotives, steam railroad equipment repairs, woodenware products, paper and paper products, iron and steel goods, flour milling, baking powder, flavoring extracts, stoves, and fertilizers make strong claims for second-place ranking. As a financial centre, Richmond is the home of 32 financial organizations and the seat of the Federal

Reserve Bank of the fifth district. In 1927 the combined resources of its banks were \$174,240,469; combined capital and surplus were \$26,349,561; and total deposits were \$136,316,327. Bank clearings increased from \$420,000,000 in 1914 to \$2,319,531,000 in 1928. The Federal Reserve Bank has resources of \$225,000,000, cash reserves of \$100,000,000, capital and surplus of \$18,000,000, and reserve deposits of \$75,000,000. The municipal airport consists of a 400-acre tract which has been developed into one of the finest fields in the United States. The Belt Line Bridge, 2278 feet long, was built over the James River in 1922 at a cost of \$477,774. In 1926 a \$3,000,000 flood sewer project was completed. The Acca Temple Mosque was erected in 1928 at a cost of \$1,750,000. Its auditorium, with seating capacity for 5000 persons, is used not only for activities of the Shrine but for grand opera and theatrical productions. A \$3,000,000 John Marshall Hotel, a main public library, and a 26-story Central National Bank Building were under construction in 1929. The English colony, Windsor Farms, is Richmond's most interesting suburban development. Two of the houses were brought from England and were reconstructed stone by stone. Agecroft Hall was built originally near Manchester in 1393, and Virginia House, which eventually will become the home of the Virginia Historical Society, was originally the Priory at Warwick, built in 1565. In 1927 building permits to a value of \$9,789,943 were issued in Richmond. The assessed valuation of property in 1928 was \$263,162,741, the net debt was \$27,010,203.

RICKENBACKER, EDWARD VERNON (1890—). An American aviator, born at Columbus, Ohio. He was for many years well known as an automobile racer and won many championships. In 1917 he went to France as a member of the motor-car staff of the Army and in the same year was transferred to the Air Service, with which he served for a time as engineering officer. He was appointed commanding officer of the 94th Aero Pursuit Squadron, the first American unit active on the western front, and in this service, he destroyed 26 enemy planes. He was the first commanding officer to conduct his own squadron into Coblenz and at the end of the World War retired with the rank of major. He received the Distinguished Service Cross, the Croix de Guerre, and other decorations. Following his military career, he organized and was vice president, until 1928, of the Rickenbacker Motor Company. He wrote *Fighting the Flying Circus* (1919).

RICKERT, HEINRICH (1863—). A German philosopher (see VOL. XIX). In 1916 he became professor of philosophy at the University of Heidelberg. His later works include *Die Philosophie des Lebens* (1920); *System der Philosophie* (1921); and *Kant als Philosoph der modernen Kultur* (1924). *Der Gegenstand der Erkenntnis* reached its sixth edition in 1928 as did a number of other earlier works.

RICKETS. Our knowledge of the nature of this affection has within recent years undergone many changes. To quote Dr. A. F. Hess of New York, more has been learned during this period than in the preceding 250 years. With the discovery of the fat-soluble vitamin, it was assumed that rickets was a deficiency disease due to the absence of this growth agent, but this view has been disproved in various ways. Nevertheless, it was probable that some growth

agent is absent from the diet. Professor McCollum has isolated his so-called vitamin D, which he regards as the missing growth agent, and which is quite distinct from the fat-soluble vitamin. This principle appears to be concerned in the calcium and phosphorus metabolism, the irregularity of which is responsible for rickets.

For some time, the subject of diet receded in importance in favor of the benefits to be derived from sunshine and activity, although the D vitamin and food articles containing it are now regarded as essential. Of substances containing this vitamin, codliver oil had long been regarded as a valuable remedy in the prevention and cure of the disease, so that the discovery of the vitamin D may be said to have been anticipated in practice. Moreover, the benefits of actual sunlight may be duplicated by the artificial ultra-violet ray. Codliver oil has been reinforced by other lipid-containing substances, especially ergosterol; but the most striking of all the discoveries in regard to rickets is the fact that when the ultra-violet ray is applied directly to foods containing lipoids, and notably to codliver oil, milk, ergosterol, etc., it apparently endows them with the properties possessed by vitamin D. These irradiated food substances have recently been tested in all parts of the world and, while the good results are not uniform, they are in many instances brilliant. In any case, the net result has been to simplify the treatment of the disease and depend largely on the use of irradiated food. See FOOD AND NUTRITION, VITAMINS.

RIDDELL, GEORGE (ALLARDICE), FIRST BARON OF WALTON HEATH (1865—). An English newspaper proprietor, formerly a solicitor. He was director of *News of the World*, *Country Life*, *Western Mail*, and of several corporations allied with the publishing business. He represented the British press at the Peace Conference from 1919 to 1922, at the Disarmament Conference in Washington (1921-22), and at the International Press Conference, Geneva, in 1927. He was made a knight in 1909 and a baron in 1920. He wrote *Some Things That Matter* (1922); *More Things That Matter* (1925); and *Dame Louisa Aldrich-Blake, M.S., M.D.* (1926).

RIDDLE, OSCAR (1877—). An American zoologist, born at Cincinnati, Ind., and educated at the University of Indiana and the University of Chicago. He taught in Porto Rico and St. Louis, was instructor at the University of Chicago (1908-10), investigator in Europe (1910-11); research associate of the Carnegie Institution (1912-15), and investigator at the Carnegie Station for Experimental Evolution (1914—). He prepared for publication the results of extended observations on the genetics of pigeons made by Professor Whitman and continued these researches especially along the line of the control of sex.

RIFF TRIBES. See MOROCCO, under *History*.

RIFLES. See SMALL ARMS.

RIGA, PEACE OF. See GALICIA; POLAND; RUSSIA, VIENNA.

RIGBY, SIR HUGH (MALLINSON) (1870—). A British surgeon, born in Dublin and educated in arts and medicine at Dulwich College, the University College, London, and the London Hospital. He rose to the post of senior surgeon to the London Hospital, of surgeon in ordinary to the Prince of Wales in 1923 and of sergeant-surgeon to King George V. in 1928. He served in France as a colonel during the

World War. For his services in connection with the King's serious illness during the winter of 1928-29, he was made a baronet.

RINDERPEST. See PHILIPPINES, *Agriculture*; VETERINARY MEDICINE.

RINEHART, MARY ROBERTS (1876-). An American novelist (see VOL. XX). Her later stories include *Tish* (1916); *The Altar of Freedom* (1917); *Long Live the King!* (1917); *Bab, a Sub-Deb, The Amazing Interlude* (1918); *Dangerous Days* (1919), *More Tish* (1921); *The Breaking Point* (1922); *The Truce of God* (1922); *The Out Trail* (1923); *Temperamental People* (1924), *The Red Lamp* (1925); *Nomad's Land* (1926), *Tish Plays the Game* (1926); *Lost Ecstasy* (1927); *Two Flights Up* (1928); and *The Romantics*, short stories (1929). She wrote a number of successful plays, including *Tish* (produced in Chicago, 1919); *Bab* (New York City, 1920); *Spanish Love* (produced by Maxine Elliott, 1920) and *The Bat*, both in collaboration with Avery Hopwood (New York City, 1920); and *The Breaking Point* (1923). She was appointed by President Hoover a member of the Public Lands Board in 1929.

RINGELNATZ, JOACHIM (1883-). A German writer and painter, who was born at Wurzen. He wrote *Kuttel Daddeldu* (1923); *Turngedichte* (1923), *Geheimes Kinderspielbuch* (1924); *Reisebriefe eines Artisten* (1927), *Allerdings* (1928); and an autobiographical novel, *Als Mariner im Krieg* (1928).

RIO DE ORO. A Spanish possession and protectorate on the northwest coast of Africa. Area, approximately 109,000 square miles; population, 100,000 natives (estimate) and 253 Europeans. The population is largely Berber and nomadic. Fishing is the chief economic resource. The budget for 1929 amounted to 6,947,274 pesetas. Villa Cisneros is the capital of the colony.

RIPLEY, WILLIAM ZEBINA (1867-). An American economist (see VOL. XX). He was made director of the Chicago, Rock Island and Pacific Railway (1917) and administrator of labor standards for the War Department (1918). He was chairman of the National Adjustment Commission of the United States Shipping Board (1919-20) and special examiner on consolidation of railways for the Interstate Commerce Commission (1920-23). He wrote *Main Street and Wall Street* (1927), a book which caused the revision of standards for non-stock voting trusts.

RIPON COLLEGE. A coeducational, undenominational institution at Ripon, Wis., founded in 1851. The enrollment increased from 249 in 1916 to 405 (exclusive of music students) in the autumn of 1928, the faculty increased from 22 to 28 members, and the library from 22,000 to 34,000 volumes. The endowment in 1928 amounted to \$668,060, and the income for the year 1927-28 to \$261,417. President, Silas Evans, LL.D., D.D.

RISLER, ÉDOUARD (1873-). A French pianist, born at Baden-Baden in Germany. In 1874 his parents settled in Paris, where he studied at the Conservatory under Diémer (piano) and Chabrier (composition), taking the first prize for piano in both the elementary and the advanced class. After further study under Klindworth, Stavenhagen, and d'Albert, he made a successful début in Paris (1894). He later toured all Europe. He made his first American tour in 1923-24. In 1906 he became a member of the Conseil Supérieur of the Paris

Conservatoire. He is considered one of the greatest of contemporary pianists, a player in the grand style, withal very poetic, with a tremendous technic reverently subordinated to the requirements of artistic expression. His enormous repertoire enables him to give complete cycles of various composers' works (Beethoven, Bach, Chopin, Schumann).

RITCHIE, ALBERT CABELL (1876-). An American lawyer and public official, born at Richmond, Va., and educated at Johns Hopkins University and in law at the University of Maryland. In 1898 he began the practice of law in Baltimore. He was city solicitor (1903-10); assistant general counsel of the Public Service Commission of Baltimore (1910-13); Attorney General of the State (1916-20), and Governor (1920-31). From 1907 to 1920, he was also professor of law at the University of Maryland Law School. During the World War, he served for a time as general counsel for the War Industries Board. He was the author of *Municipal Condemnation in Maryland* (1904). Governor Ritchie wrote and spoke vigorously in opposition to national prohibition.

RITSCHEL, WILHELM (1864-). An American marine painter (see VOL. XX). He was elected a full member of the National Academy in 1914. He won a gold medal from the National Arts Club (1914) and a gold medal from the Panama-Pacific International Exposition (1915). During the next year, he was awarded the gold medal of the State Fair at Sacramento, Calif., and in 1918 the gold medal of the Philadelphia Art Club. In 1921 he won the Ranger Purchase Prize from the National Academy of Design and the Isidor Medal from the Salmagundi Club in 1923.

RIVERA Y ORBANEJA, MIGUEL PRIMO DE, MARQUIS DE ESTELLA (1870-). A Spanish general and dictator, born at Cadiz. He served in Cuba and the Philippines during the Spanish-American War, in Morocco (1909-13), as military governor of Cadiz (1915-17), resigning in the latter year on account of differences with the Government in regard to civilian controllers in the army, and in 1922 was military governor of Barcelona, where he took effective steps against the syndicalists. He organized army officers into a national committee of defense whose programme was to end the war in Morocco by the elimination of corruption and incompetency in the conduct of the campaign. In September, 1923, he overthrew the government, established himself as dictator and Prime Minister, and with the support of the King instituted widespread economic reforms and finally brought the campaign in Morocco to a victorious close in 1926. Recurrent conspiracies and revolts were put down without great difficulty, and on June 12, 1928, he announced his intention of remaining in office for at least two years more, pending the drafting of a new constitution. The new constitution, to replace that suspended in 1923, was presented to the National Assembly July 5, 1929, for examination. See SPAIN, under *History*.

RIVIÈRE, ré'vyâr', JACQUES (1886-1925). A French author and editor who was born in Bordeaux and educated at the Lycée Lakanal in Paris, and in philosophy at the Sorbonne. His early writing in *L'Occident* (1907) and *La Grande Revue* was mainly critical, and from 1909 to 1914, he was secretary of the *Nouvelle Revue Française* and a frequent contributor to

it. During August, 1914, he was made a German prisoner, by 1917 his health was so broken that he was interned in Switzerland. In 1918 he was repatriated. From 1919 until his death from typhoid fever in 1925, he edited the *Nouvelle Revue Française* and made it the leading literary monthly of Paris. While in prison in Germany, he wrote *A la trace de Dieu and Aimée*, a novel. Besides the essays in *Études* (7th ed., 1924) and the *Nouvelle Revue Française*, he wrote *L'Allemand*, on German psychology. From 1926 to 1928, his correspondence with Alain-Fournier (his wife's brother, killed in August, 1914) was published in 4 vols. as *Jacques Ruyère et Alain-Fournier Consult Jeunes Maîtres, états d'âme d'aujourd'hui* by Paul Archaubault (1926).

RIZA KHAN PAHLEVI (1877-). Shah of Persia since Oct. 31, 1925. The son of a farmer, he joined the army as a private at the age of 16, became commander-in-chief, and on Feb. 20, 1921, overthrew the existing ministry. His programme was Persia for the Persians, and the new cabinet, which he supported, refused to sign the Anglo-Persian agreement. Great Britain withdrew her troops and her financial adviser and in the next year Dr. A. C. Mills, an American, became economic adviser (resigned in 1928). From Feb. 15 to Oct. 25, 1923, Riza Khan was War Minister, and on the latter date became also Premier and Minister of the Interior, retaining his command of the army, which was sympathetic with his aims. His suggestion of a republic being opposed, particularly by the priests, he resigned, but was shortly recalled by the Medjliss (Parliament). In February, 1925, he was given full power by the Medjliss, on October 31, the Shah was deposed and Riza Khan made Regent, and on December 13 the constituent assembly elected him hereditary Shah. He was crowned on Apr. 25, 1926. He unified Persia, and established order, regular and fair collection of taxes, and equal treatment for the various communities. Through his initiative, all foreign capitulations were abrogated on May 10, 1928. See PERSIA, under *History*.

ROADS AND PAVEMENTS. The roads of the world had a total length of nearly 6,600,000 miles in 1928, of which 3,600,000 were in the North, South, and Central Americas, nearly 2,000,000 in Europe, and over 1,000,000 in Asia, Australia, and the islands of the Pacific. Of 3,600,000 miles in the Western Hemisphere, over 3,000,000 were in the United States. These figures were obtained by a world-wide survey, conducted by the U. S. Departments of Commerce and State in 1927-28. (See "Highways of the World," with table, in *Commerce Reports*, Nov. 10, 1928.) The survey covered also the number of motor vehicles ("automotive vehicles" in the report). These totaled 31,600,000 for the world and averaged 4.81 per mile of road, while the number of persons to one motor vehicle averaged 60. The miles of road per square mile of area averaged less than 8. The accom-

panying table gives the exact figures and averages for the world, the five continents, and the 19 countries which had 40,000 miles of road or over. Annual revisions of the figures are promised.

In *Commerce Reports* for Dec. 12, 1928, a summary of the highways of the world by types of construction or surfacing was given, from which the accompanying table has been made up. In the original, the figures here summarized were given by countries, also a table showing by continents and for the world a more detailed classification by types, but with many gaps indicating no figures available. Next to water-bound macadam, in the world totals, stood Portland-cement concrete, 49,254 miles; then bituminous macadam, 25,877 miles; stone block, 25,818 miles, bituminous concrete, 9,921 miles, asphalt, 7,271 miles. These figures are stated to be misleading, as some countries with a large percentage of high-type road surfacing had no segregated figures.

United States. Most of the 3,000,000 miles of roads in the United States are in the jurisdiction of counties and rural towns and townships. An estimate put out by the Department of Agriculture in January, 1929, classed as local rural roads 2,750,000 of the 3,000,000 total (both round numbers) and placed 1,750,000 under townships and 1,000,000 under towns or townships. Of the 3,006 counties in the 48 states, 67 (in New England) had nothing to do with roads, of the 2999 remaining, only 975 were credited with reasonably competent control over road construction and maintenance. The rapid increase in road construction by the several States since 1905, accelerated after 1916 by Federal contributions toward cost, have resulted in the creation of more or less efficient highway departments in every State of the Union, that being one of the conditions under which Federal aid is granted. Large as has been the expenditure for road improvement in the United States during the twentieth century, most of the 3,014,000 miles of highway were still primitive dirt roads in 1928, estimates by the U. S. Bureau of Roads classing only 590,000, or less than 20 per cent, as "improved." Of these, only 92,000 miles were hard-surfaced road, while 412,000 were covered with gravel or water-bound macadam, and 84,000 had sand-clay surfaces. Federal aid in State-road construction began with \$5,000,000 for the fiscal year 1917 and was materially increased subsequently.

Expenditure of the Federal-aid money by the several States is subject to the approval of the U. S. Bureau of Public Roads acting for the Department of Agriculture. The Federal Aid Road Act of Nov. 9, 1921, requires each and every State receiving Federal aid to lay out, in conjunction with agents for the Federal government, a State-highway system which must be so planned as to provide for interstate connection. The Federal-aid roads in each State must not exceed 7 per cent of the total highway mileage

HIGHWAY MILEAGE OF THE WORLD *

	Whole World	America	Europe	Australia ^b	Asia	Africa
Earth, sand-clay, or gravel	5,564,783	3,405,562	1,337,467	320,912	313,641	187,201
Water-bound macadam	588,873	76,477	351,705	40,035	103,229	17,427

Total	6,582,001	3,574,731	1,976,037	406,874	418,457	205,902

* Not including bridle paths, pack trails, etc., totaling 251,209 miles, with no reports from many countries.

^b Including New Zealand, and islands in the Pacific.

ROAD MILEAGE AND NUMBER OF MOTOR VEHICLES BY CONTINENTS AND VARIOUS COUNTRIES

Figures taken from the article, "Highways of the World," in *Commerce Reports*, November, 1928, based on a survey by the U. S. Departments of Commerce and State. Only countries with 40,000 miles of roads here included; original table includes all the countries of the world. The figures do not include mileage of city streets.

Continent and country	Road mileage	Area (square miles) to 1 mile of road	Motor Total	Vehicles to 1 mile of road	Persons to 1 motor vehicle
World Total	6,582,001	7 69	31,617,615	4 81	59 91
The Americas	3,574,731	4.4	25,001,625	7	9 2
Europe	1,976,037	5 2	5,244,695	2 7	100 4
Asia	418,457	248 8	375,910	.89	2,642 3
Australia, New Zealand and Pacific Islands	406,874	8 1	717,585	1 76	12 8

of the State and upon these roads all Federal-aid apportionments must be expended. The State highway systems so laid out are divided into primary and secondary roads, the primary not to exceed three-sevenths of the total.

The Act of 1921 provided that the several States must certify the mileage of their highways, as of Nov. 1, 1921, which proved to be a total of 2,866,061 miles. After coordination by means of conferences between the Bureau of Public Roads and groups of adjacent States, the bureau named recommended a road map of the United States to the Secretary of Agriculture. This map was published Nov. 1, 1923, and included 168,881 miles, which by 1928 had been increased to 187,573. The monthly summary of the status of Federal-aid road construction for Dec. 31, 1928, showed 76,075 miles completed, 8163 miles in the initial stage of construction, and 1053 miles of existing improved roads being provided with a surface of higher type. The larger of the accompanying tables shows these mileages by States, as well as mileages approved for construction and cost figures.

Of the 71,074 miles of Federal-aid roads "completed" to June 30, 1928, only 35 per cent were hard surfaced, the remaining 65 per cent ranging from mere grading and draining to water-bound macadam. Mileages and percentages are shown by the accompanying table.

MILEAGE OF FEDERAL-AID ROADS IMPROVED
AS OF JUNE 30, 1928, BY TYPES
(Compiled by Bureau of Public Roads, U. S. Department of Agriculture)

Graded and drained	10,611	15
Sand clay	6,471	9
Gravel	27,698	39
Water bound macadam	1,427	2
Bituminous macadam	4,317	6
Bituminous concrete	1,993	3
Portland-cement concrete	17,516	25
Brick	818	1
Bridges	223	.
	71,074	100

Large bond issues for State-road construction began in 1906, when New York State voted \$50,000,000 for the purpose. Following the World

War, authorization of large State road bond issues became increasingly common, running to \$100,000,000 in Illinois in 1921 and in Iowa in 1928 (both subsequently held unconstitutional through defective drafting). At the close of 1927, 31 States had \$860,000,000 of road bonds outstanding, according to the U. S. Department of Agriculture, while, on the same date, the outstanding county and township bonds totaled \$1,386,000,000. The same authority gave the total income for road expenditure (including funds for maintenance) for the year 1927, according to the latest figures available, as \$1,581,000,000. Of this, \$740,000,000 (including \$80,000,000 of Federal aid) was available for State-road work and \$841,000,000 for county and township work. In origin, the \$1,581,000,000 total was thus accounted for: Road tax (for county and township use only), \$405,000,000; motor-vehicle tax, \$300,000,000; bonds, \$272,000,000; gasoline tax, \$219,000,000. Federal aid (for State roads only), \$80,000,000, source not given. \$305,000,000. Users of the roads contributed \$519,000,000 (motor-vehicle and gasoline taxes) or one-third of the total, road taxes about a fourth, bonds, about a sixth; Federal aid, a twentieth part, while a fifth was unaccounted for. In round numbers, nearly half of the county and township road fund (\$405,000 of \$841,000) came from road taxes, two-fifths from bonds; one-fifth from gasoline and motor vehicle fees, leaving two-fifths unaccounted for.

To the 78,096 miles of roads improved by Federal aid at the close of the fiscal year 1929, there should be added what has been done by the States without Federal aid. The U. S. Bureau of Public Roads concluded that the States had improved a larger mileage unaided than with Federal aid, so it may be assumed that between 150,000 and 160,000 of the 188,000 miles in the Federal-aid highway system had been improved to some degree. For the six fiscal years, 1923-28, Federal-aid funds "obligated" totaled \$500,607, an average of \$83,434,000.

In the Philippine Islands, the Bureau of Public Works (under the direction of the United States) reported 5630 miles of "improved" roads at the close of 1927, but this

* The term stage construction refers to additional work done on projects previously improved with Federal-aid funds. In general, such additional work consists of a surface of a higher type than provided by the initial improvement

included practically no asphaltic or Portland-cement concrete surfacing. Total road expenditures for 1927 were P.12,532,000 (\$6,266,000), about equally divided between construction and maintenance.

Cuba. Early in 1927, contracts were let for a central highway extending the length of the island, from Pinar de Rio to Santiago, a distance of 707 miles. The roadway will be improved to a width of 20.66 feet with an American type of surfacing on a concrete base, with thickened outer edges. The contract prices totaled \$76,000,000, divided between a Cuban and an American contractor.

Mexico. Through an engineer-official appointed by the Minister of Communications, there was announced in January, 1929, a \$41,000,000 road-improvement programme for 1929-34, including a highway for motor vehicles extending from the United States to Guatamala. Funds were to be obtained from the existing gasoline tax of 4 cents per litre (about 8 cents per U. S. gal.) and an increase in the tobacco tax.

British Isles. The total mileage of "classified" roads and streets in England, Wales, and Scotland is given as 178,737 in *The Municipal Year Book*, 1928, of which 153,661 is credited to England and Wales and 25,076 to Scotland.

Materials and Design. The leading materials used in the construction of both rural improved-road surfaces and city pavements became increasingly alike with the growth of motor-vehicle traffic and the loads carried. A worldwide view would show that many large and important countries of the world still have practically nothing but dirt roads and rude trails.

In the cities of the United States and many other civilized countries, there is still a considerable percentage of dirt streets and much gravel or water-bound macadam surfacing, neither of these surfacings being fit to stand heavy traffic. For both rural highways and city streets, where macadam is still being put down, the water-bound macadam is being superseded by bituminous-bound surfacing. Portland-cement concrete in both country and city is being used more and more extensively for pavements and rural highway surfaces, with steel reinforcement under the heaviest loading in some cases, and there is a continuing increase in the use of Portland-cement concrete base or foundation for rural and city pavements, regardless of what material is used for the wearing surface. Brick surfacing is used quite extensively in some parts of the United States, for both rural roads and city streets, the degree of use depending considerably upon proximity to paving-brick centres of manufacture. Sheet-asphalt surfacing is still in high favor for city streets in some sections of the country. For very heavy-traffic city streets, granite blocks are still extensively used, but their greater roughness, as compared with other readily available pavements, is against them.

Standardization. Standardization in paving material and construction has made marked progress. Standard specifications for various kinds of paving have been framed by committees of the American Society for Municipal Improvements and adopted by the society on letter ballot. Through the coöperation of the U. S. Department of Commerce, road and paving engineers, and manufacturers, the varieties of paving brick were reduced from 66 to 7 in 1922, then to 6 in 1923, to 5 in 1924, and to 4 in 1925. Likewise, grades of asphalt used for paving were

reduced in number from 88 to 9 in 1923, as based on the penetration test used to show relative hardness.

Cleaning and Snow Removal. For machine cleaning of streets, motor-driven vehicles with or without pick-up attachments are increasing in degree of use. Hand cleaning is still considered to have material advantages, but lessens in importance with the diminishing extent of the use of horses. Snow removal both from city streets and from long stretches of rural highway is becoming increasingly common to meet the demands of motor-vehicle traffic. Snow plows and sweepers are employed, together with mechanical means of loading the snow into motor or other vehicles for carting away.

Bibliography. Recent new books or revised editions of important old ones include: Harger and Bonney, *Handbook for Highway Engineers* (New York); Blanchard, *American Highway Engineers' Handbook* (New York); Harger, *Location, Grading and Drainage of Highways and Rural Highways* (New York); Agg, *Construction of Roads and Pavements and American Rural Highways* (New York); Agg and Brindley, *Highway Administration and Finance* (New York); Boulnois, *Modern Roads* (London); Green, *The Science of Roadmaking* (London); Besson, *City Pavements* (New York); Chatbun, *Highways and Highway Transportation* (New York); Holt, *The Bureau of Public Roads* (Washington), No. 26 of *Service Monographs* of the United States government; Baalsrud (tr. from the Norwegian by Hansen) *Highways of Norway* (Oslo); Neumann, *Der Neuzzeitliche Strassenbau* (Berlin). ROBERT, JACQUES HENRI See HENRI-ROBERT, JACQUES

ROBERTS, KENNETH LEWIS (1885-). An American writer, born at Kennebunk, Me., and educated at Cornell University. From 1909 to 1917, he was a reporter and special writer on the *Boston Post*. In 1915-18 he was a member of the staff of *Life* (New York). In the World War, he served as captain of the Intelligence Section of the Siberian Expeditionary Force and from 1919 to 1921 was foreign correspondent in Central Europe and the Balkans for the *Saturday Evening Post*, and Washington correspondent for the same magazine from 1921. He wrote *Europe's Morning After* (1921), *Why Europe Leaves Home* (1922), *Sun Hunting* (1923), *Black Magic* (1924), *Concentrated New England* (1924), *Florida Loafing* (1925), *Florida* (1926).

ROBERTS, MORLEY (1857-). An English author (see Vol. XX). His later publications include *Hearts of Women* (1919), *Warfare in the Human Body* (1920), *Lyra Mutabilis, The Mirthful Nave* (1921), *Followers of the Sea* (1923), *On the Earthquake Line* (1924), *Malignancy and Evolution* (1926), *On the Old Trail* (1927).

ROBERTSON, ARCHIBALD THOMAS (1863-). An American theologian (see Vol. XX). His later publications include *Harmony of the Gospels for Students of the Life of Christ* (1922); *Types of Preachers in the New Testament* (1922); *The Minister and His Greek New Testament* (1923); *The Christ of the Logia* (1924); *New Testament History* (1923); *An Introduction to the Textual Criticism of the New Testament* (1925); *Studies in the Text of the New Testament* (1926); and *Minor Characters in the New Testament* (1928). He was also the translator of *Luke's Gospel* (with grammatical notes, 1923).

ROBERTSON, SIR CHARLES GRANT (1869–). A British historian, educated at Hertford College, Oxford. A fellow since 1893 of All Souls' College, Oxford, he was domestic bursar there (1897–1920), and senior tutor in modern history (1905–20) at Magdalen College. In 1920 he became principal and in 1927 vice chancellor of Birmingham University. In the latter year he was Creighton lecturer at the University of London. He was knighted in 1928. His works include *The Rise of the English Nation* (1895); *England under the Hanoverians* (1911); *A Historical Atlas of Modern Europe* (1915); *The Evolution of Prussia*, with J. A. R. Marriott (1915); and *Bismarck* (1918).

ROBERTSON, WILLIAM (ROBERT), FIRST BARONET (1860–). A British soldier (see VOL. XX). He was quartermaster general at the outbreak of the World War and efficiently outfitted the troops sent to France. In 1915 he was chief of the General Staff of the British Expeditionary Force and from 1915 to 1918 chief of the Imperial General Staff. In February, 1919, he was appointed to the eastern command and in June of that year became general officer with command of the troops in Great Britain. In 1919–20 he commanded the British Rhine Army in Germany. He was created a baronet in 1919, became a field-marshal in 1920, and received many decorations and honors. He published *From Private to Field-Marshal*, reminiscences (1921), and *Soldiers and Statesmen, 1914–18* (1926).

ROBIN, LÉON (1866–). A French philosopher and classical scholar, born at Nantes, and educated at the Sorbonne. He taught at the Collège de Compiègne and the lycées of Vendôme and Angers and was made professor at the Sorbonne in 1918. His first publication, *La théorie platonicienne des idées et des nombres d'après Aristote* (1908), gave him an international reputation. His other works include *La Théorie platonicienne de l'amour* (1908); *Etude sur la signification et sur la place de la physique dans la philosophie de Platon* (1919); *La pensée grecque et les origines de l'esprit scientifique* (1923), and a critical and explanatory comment on *Lucrèce: De Rerum Natura*, with A. Ernout, 2 vols. (1925–26). Besides articles in reviews, he edited and translated vol. 4 of the *Oeuvres Complètes de Platon*.

ROBINS, RAYMOND (1873–). An American social economist (see VOL. XX). In 1916 he was chairman of the Progressive National Convention and also leader of the national Christian evangelistic social campaign in American universities and colleges (1915–16). He was chief of the Red Cross Mission to Russia in 1917 and 1918. He campaigned in the United States for the enforcement of constitutional prohibition. He was a member of the executive committee of the National Republican Committee during the campaigns of 1920 and 1924.

ROBINSON, EDWIN ARLINGTON (1869–). An American poet (see VOL. XX). He continued to produce poetry of high merit during the decade 1914–24. His later books include two plays, *Van Zorn* (1914) and *The Porcupine* (1915). He wrote also *The Man Against the Sky*, poems (1915); *Lancelot*, a poem (1920); *The Three Taverns*, poems (1920); *Avon's Harvest*, poems (1921); *Collected Poems* (1924); *Roman Bartholomew* (1923); *Tristram*, poem (1927); *Sonnets* (1889–1927) (1928); and *Collected Poems* (1929). Consult *Aspects of the*

Poetry of Edwin Arlington Robinson, by Lucius Bube (1928).

ROBINSON, JOSEPH TAYLOR (1872–). A United States Senator (see VOL. XX). He was reelected to the Senate in 1918 and in 1925 for the term expiring in 1931. He has served as chairman of the Minority Conference since the Sixty-eighth Congress and has been a member of the committees on Foreign Relations, Naval Affairs, and Territories and Insular Possessions. In 1928 he was the Democratic candidate for Vice President.

ROBINSON, LENNOX (1886–). An Irish dramatist, one of the younger writers of the Irish Literary Revival, born at Douglas, Cork. He was manager of the Abbey Theatre, Dublin, during 1910–14 and 1919–23, director of it in the latter year, and during 1915–25 organizing librarian of the Carnegie Trust. His plays are interpretations of his native country. Life in rural and small-town Ireland is depicted in *The Clancy Name*, his first play, produced at the Abbey Theatre in 1908; *The Cross Roads*, played in 1909; and *The Whitechadred Boy*, played in Dublin in 1916 and later in London, the United States, and Australia. Of his political plays, *The Dreamers* (1915), based on Robert Emmet's unsuccessful revolution of 1803, is perhaps the best. Others are *Patriots* (1912), and *The Lost Leader* (1918). His other produced plays include *The Round Table* and *Crabbed Age and Youth* (1922); *Never the Time and the Place* (1924); *Portraits* (1925), and *The Big House* (1926). He also wrote a novel, *A Young Man from the South* (1917), and the stories *Dark Days* (1918), and *Eight Short Stories* (1919). He edited *The Golden Treasury of Irish Verse* (1925), and *Poems of Thomas Parnell* (1927).

ROBISON, SAMUEL SHELBURNE (1867–). An American naval officer, who graduated from the United States Naval Academy in 1888. He served during the Spanish-American War and filled many important posts on land and at sea. He was with the Bureau of Equipment in 1909–10 and with the Bureau of Steam Engineering in 1910–11. In 1917–18 he was commander of the submarine force of the Atlantic Fleet and in 1918–19 a member of the Naval Armistice Commission. He was promoted to be rear admiral in 1918. In 1919–21 he was commandant of the Navy Yard in Boston, and in 1921–22 military governor of Santo Domingo. He was admiral in command of the Battle Fleet, 1923–25, and admiral in command of the U. S. Fleet, 1925–26. Since 1926 he has been commander of the 13th Naval District.

ROCHESTER. The third city in size in New York State. The population rose from 220,087 in 1910 to 295,750 in 1920, and to 328,200 in 1928, according to estimate of the U. S. Bureau of the Census. On Jan. 1, 1928, the council-manager form of government became effective. Under the new charter, the council of the nine members acted as the legislative and policy-forming body of the city government, making all local laws and ordinances, authorizing all expenditures of city funds, and appointing the city manager. A city-planning bureau was created in the office of the city engineer in 1917. The superintendent in charge, who was appointed by the city engineer, had power to make a city plan, to pass on all plotting for the opening, widening, or extension of streets, and to establish building zones. In 1928 the formation of a Monroe County Regional Planning Board, consisting of five members, to

coöperate with the planning boards of Rochester and towns within the county, was authorized. A Civic Centre at Court Street and South Avenue was to be developed during 1930. Other contemplated improvements were the extension of Broad Street and widening of Smith Street, the development of a harbor on Lake Ontario, and the construction of a new \$1,000,000 Smith Street Bridge across the Genesee River.

Work was begun in 1922 on transforming the dry bed of the Erie Canal, which had been abandoned in favor of the new Barge Canal, into a freight and passenger subway, carrying trolley and railroad tracks. Eight and one-half miles of the canal were laid with track; of this, one mile in the heart of the city was covered over and a street built above it, parallel to and relieving the congestion of Main Street. The cost of the completed work was more than \$12,000,000. In 1922 the Eastman Theatre, the third in size in the United States, was built, through a gift from George Eastman, for public use under the management of the Eastman School of Music of the University of Rochester.

The Rochester municipal airport is located 4 miles from the city. Air-mail and freight services are provided by the Colonial Western Airways, Inc., and passenger-plane service, by the Ryan Airways, Inc. The value of products manufactured by 1044 industrial establishments in 1927 was \$427,730,972, according to local estimate. During 1922 the city's export trade amounted to approximately \$10,000,000; in 1928 it had increased more than \$21,000,000. Bank clearings in 1928 amounted to \$777,900,000. The assessed valuation of real and personal property in 1928, according to local estimate, was \$634,665,209, as compared with \$521,868,000 in 1927. This gain was attributed primarily to a 20 per cent increase in the assessed valuation of real estate. The bonded debt in 1928 was \$64,238,030.

ROCHESTER, UNIVERSITY OF. A coeducational, nonsectarian institution of higher learning at Rochester, N. Y., founded in 1850. The student enrollment increased from 531 in 1915 to 1419 in the autumn of 1928. The faculty increased from 45 to 314 in the same period, and the libraries from 66,000 to more than 162,000 volumes. Productive funds as of June 30, 1928, were \$28,757,382.46 and total resources, including land, buildings, equipment, and endowment were approximately \$45,000,000. George Eastman gave \$4,500,000 to found the Eastman School of Music which was opened in 1921 with an endowment of \$2,234,509. In 1921 he gave \$4,000,000 to found a School of Medicine and Dentistry, and the General Education Board gave \$5,000,000 for the same purpose. The school was opened to students in the fall of 1925. The university received \$673,350 from the estate of L. P. Ross in 1917 to found the department of vital economics. In 1925 a dormitory for women students in the school of music, an addition to the Memorial Art Gallery, the medical school and Story Memorial Hospital with staff house, nurses dormitory, laboratories and power plant, were erected. Ground was broken in May, 1927, for the first building for the college for men. Among the buildings contemplated are a students' union, an auditorium-administration building, chemistry, biology-geology, physics and engineering buildings, a library, a liberal arts building, dormitories, and a gymnasium. It is expected that these will be completed by 1930, thus permitting the re-dedication of the present

campus and buildings to the college for women. President, Rush Rhees, D.D., LL.D.

ROCKEFELLER, JOHN D (AVISON) (1839-). An American capitalist (see Vol. XX). It was estimated that the total amount given by Mr. Rockefeller for philanthropic and charitable purposes, up to 1921, exceeded \$500,000,000. The Rockefeller Foundation, the General Education Board, the Laura Spelman Rockefeller Memorial, and the Rockefeller Institute for Medical Research together received nearly four-fifths of this sum. These great corporations all were created by him. Consult *John D.: A Portrait in Oils*, by John K. Winkler (1929).

ROCKEFELLER, JOHN D (AVISON), JR. (1874-). An American capitalist (see Vol. XX). He continued active in business and philanthropy during the years 1914-29. He contributed large sums of money to various causes and was especially active in church activities. In 1929 he was awarded the gold medal of the National Institute of Social Sciences for "distinguished social service." He is the author of *The Personal Relation in Industry* (1923).

ROCKEFELLER FOUNDATION. An institution chartered in 1913 "to promote the well-being of mankind throughout the world." The scope of its present activities is in a broad way indicated by the names of the two divisions through which it carries on its work. The International Health Board, and the Division of Medical Education.

The International Health Board assists various public health projects throughout the world, encouraging the establishment of schools of hygiene and governmental health agents. It has been active in the control of yellow fever, malaria, and hookworm disease. A survey in 1925 showed that the only cases of yellow fever in the Western Hemisphere were in Brazil, and the Board therefore cooperated in the attempt to exterminate the fever mosquito from that region, and in taking preventative measures in several Central American countries. A commission also was sent to investigate yellow fever in West Africa. Similar work was continued the following year, and in 1927 when the commission found that it had not been able to check the spread of the disease, it devoted itself to discovering the identity of the infection. In Rio de Janeiro, 123 cases of yellow fever were reported in 1928, and the foundation aided health authorities there and in other localities. Malaria research and practical aid was furthered by the foundation between 1924 and 1929, in the United States, Central America, South America, Europe, the Far East, the Philippines, and Porto Rico, 18 countries in 1928. Study of the hookworm was carried on over the same period, and in 1928 the foundation contributed to the work of health organizations of 24 States of the United States, and of 20 other countries. An important feature of the foundation's health work in the past few years has been the promotion of medical colleges in China, where the board contributed to 12 universities in 1928.

Numerous other educational institutions in various parts of the world received regular assistance from the Division of Medical Education, biological research and public hygiene. In 1929 the Laura Spelman Rockefeller Memorial Fund of \$2,500,000 was combined with the Rockefeller Foundation.

ROCKEFELLER INDUSTRIAL REPRESENTATION PLAN. See LABOR ARBITRATION.

ROCKFORD COLLEGE. A nonsectarian, liberal arts college for women, with an enrollment limited to 400; chartered in 1847 at Rockford, Ill. The registration of matriculated students increased from 242 in 1914 to 406 in 1927-28, with an additional 242 in music and extension; the faculty was increased from 39 to 44 members, in 1928, and included a Jane Addams professor of sociology and social service; the endowment was approximately \$1,000,000 in 1928; and the income, increased from \$109,391, to \$270,000 in 1927-28, including student fees and board; the student-aid trust fund of the institution amounted to \$375,000, largely a gift of Hobart W. Williams of Chicago. Eighty students received awards in 1927-28. The college carried on a vigorous adult higher-education programme; contributed directly to the development of the art movement in Rockford, through activities of its professors of painting and sculpture, and aided the local Sunday schools by organizing a city council of education. A new dormitory with swimming pool was constructed, and a project for a new library and chapel was launched in 1928. The president, William Arthur Maddox, Ph.D., LL.D., was inaugurated in 1919.

ROCKS. See GEOLOGY.

RODMAN, HUGH (1859-). An American naval officer, born in Frankfort, Ky., and graduated from the United States Naval Academy in 1880. He served in the Spanish-American War and afterward performed many important services on shore and afloat. In 1916 he was appointed a member of the General Board of the Navy Department, and in the year following commanded the 3d Division of the Atlantic Fleet. In November, 1917, he was appointed commander of the 9th Division of the battleship force and with it served in the British Grand Fleet. For a year, he was commander of the 6th Battle Squadron of the British Grand Fleet in the North Sea. In 1919 he was commissioned admiral and commander-in-chief of the Pacific Fleet. He was retired in 1923. He received decorations and honors from several foreign governments.

RODRÍGUEZ CARRACIDO, José (1856-1928). A Spanish chemist, educator, political leader, and man of letters, born in Santiago (La Coruña). He studied pharmacy at the University of Santiago and took his doctor's degree at the University of Madrid (1875). After serving as a pharmacist in the army (1875-80), he was professor of pharmacy at the University of Madrid (1881-98) and professor of biological chemistry there (1898-1926). For many years, he was dean of the faculty of pharmacy at Madrid and he was rector of the university from 1916 until his death; librarian and, after 1922, director of the Royal Academy of Exact, Physical, and Natural Sciences, a leader of the central group of the Liberal Party; and a member of the Spanish Senate (life Senator after 1923). Numerous foreign academies and universities bestowed honorary memberships or degrees upon him. His publications include *Tratado de química orgánica* and *Tratado de química biológica* (many editions); innumerable technical monographs; the novel, *La muceta roja*; the essays, *Jocellanos* (1893); and *Estudios historico-críticos de la ciencia española* (1897 and 1917), and the biography, *El padre José de Acosta y su importancia en la literatura científica española* (1899),

crowned and published by the Royal Spanish Academy of the Language.

RODRÍGUEZ MARÍN, FRANCISCO (1855-). A Spanish critic, literary historian, and Cervantes scholar. Born in Osuna, he made his bachelor's studies in the Institute of Osuna (1864-69). Because of poor health, these studies were interrupted for five years, during which he devoted himself to wide reading, to music, to writing verse, and to collecting folk tales. From 1874 to 1880, he studied law in the University of Sevilla and during 1880-83 he was a journalist in Sevilla. He practiced law in Osuna from 1883-95, when he moved to Sevilla. There he founded *El Folklore Andaluz*, short-lived, but fruitful in its subsequent influence. In 1905 he moved to Madrid and was at once elected a member of the Royal Spanish Academy of the Language, of which he later became librarian. His published works constitute more than 115 titles, or more than 130 volumes. The most important are his studies in lexicography, his critical editions and studies concerning various editions of the *Novelas Ejemplares* of Cervantes, and his monumental critical and illustrated editions (some in four, some in six, and some in eight volumes) of *Don Quijote*.

ROGER-DUCASSE, JEAN-JULES (1875-). A French composer, born at Bordeaux. He studied composition under G. Fauré at the Paris Conservatoire and won the second Prix de Rome in 1902. After 1909 his works figured prominently in concerts in Paris and won favor outside of France. He is one of the neo-classicists whose works rest on the solid foundations of the classic masters, with slight impressionistic coloring. He wrote a ballet, *Orphée* (Paris, 1913), for orchestra, *Variations Plaisantes sur un Thème Grave, Suite Française, Prélude, Petite Suite, Prélude d'un Ballet, Le Jeu de Fuset* (scherzo), and the symphonic poems *Sarabande* (with solo voice), *Au Jardin de Marguerite* (with soli and chorus), *Nocturne de Printemps, Épithalame, Poème symphonique sur le nom de Fauré, Sur Quelques Vers de Vergile* for chorus and orchestra, a string quartet and a piano quartet; several motets; and piano pieces.

ROGERS, JAMES GAMBLE (1867-). An American architect. He was born at Bryant's Station, Ky., and graduated at Yale (1889). Since 1905 he has practiced architecture in New York City, designing the Sterling Memorial Library and the Harkness Memorial Quadrangle at Yale University, the New Haven Post Office, the Sophie Newcomb College at New Orleans, the Shelby County Court House at Memphis, Tenn., the Brooks Memorial at Memphis, and the Columbia and the Yale medical centres.

ROGERS, ROBERT WILLIAM (1864-). An American Orientalist (see VOL. XX). He was instructor at Columbia University summer sessions (1915-21) and professor at Princeton and Drew Theological Seminary. His later works are *History and Literature of the Hebrew People* (1917); *Great Characters of the Old Testament* (1920); and *Old Testament Lessons* (1921).

ROGERS, WILL (1879-). An American actor, orator, and writer, educated at the Kemper Military School at Boonville, Mo. He made his first appearance on the stage at Keith's Union Square Theatre in New York City in 1905. Later successes were made with the *Ziegfeld Follies*, with which he became associated in 1907 and in *Three Cheers* in 1929. He also is well-

known as an after-dinner speaker and journalist. In 1924 and 1928, he covered the meetings of the national political conventions for the New York Times. He wrote *Illiterate Digest* (1924); *Letters of a Self-Made Diplomat to His President* (1927), and *Will Roger's Political Follies* (1929).

ROHRBACH, rōr'bag, PAUL (1869-). A German writer (see VOL. XX). Among his later works are *Die Geschichte der Menschheit* (1914); *Russland und Wir* (1915); *Weltpolitisches Wanderbuch* (1915); *Das Baltendbuch* (1917); *Woher Es Kam* (1919); *Politische Erziehung* (1919); *Die Beweise für die Verantwortlichkeit der Entente am Weltkrieg* (1920); *Gottes Herrschaft auf Erden* (1921); *Die Länder und Völker der Erde* (1925); *Amerika und Wir* (1925); and *Deutschland in Not* (1926).

ROLLAND, rô'lan', ROMAIN (1866-). A French writer (see VOL. XX). He received the Nobel Prize for literature in 1915, following the completion of *Jean-Christophe*. During the World War, his pacifism, expressed in *Au-dessus de la Mêlée* (1915), and later in *Les précurseurs* (1919), incurred the displeasure of the French people, and he withdrew to Switzerland. His popularity returned after the War, and he wrote the novels *Pierre et Luce* (1918); *Colas Breugnon* (1919); *Clerambault* (1920); and a series called *L'âme enchantée*, comprising *Annette et Sylvie* (1922), *L'été* (1924), and *Mère et fils* (1926). Also the plays *Lilulue* (1920), *Le jeu de l'amour et de la mort* (1925), and *Pâques fleuries* (1926), the prologue to *Les Léonides* (1929), a drama of the French Revolution. Other works were *Voyage Musical ou pays du passé* (1920); *Mahatma Gandhi* (1924); *Beethoven, pour le centenaire de sa mort* (1927, Eng. trans., 1929). Most of these books were translated into English. Consult *Romain Rolland, the man and his work*, by Stefan Zweig (1921), and, *Liber Amicorum Romain Rolland* (1926).

ROLLESTON, SIR HUMPHREY (DAVY) (1862-). A British physician, grandnephew of Sir Humphrey Davy, born at Oxford, England. Educated in arts at St John's College, Cambridge, he took his medical degree at St Bartholomew's. He was president of the Royal College of Surgeons (1922-26), president of the Royal Society of Medicine (1918-20), and was made physician in ordinary to the King in 1923. He was knighted in 1924 and became Regius professor of physics at Cambridge in 1925. He was coeditor with Sir C. Allbutt of the second edition of the *System of Medicine*. His chief works are *Diseases of the Liver and Some Medical Aspects of Old Age* (1922).

ROLLINS COLLEGE. A coeducational institution of higher learning at Winter Park, Fla., founded in 1885. Student enrollment in the fall of 1928 totaled 267, there were 68 members of the faculty, and 22,000 volumes in the library. Productive funds in the same year amounted to approximately \$600,000. The college is a pioneer in promoting the idea of a two-hour conference plan of education. A student, instead of reciting for an hour and studying for an hour, remains in the class-room for two hours in study, recitation, and conference with his instructor. The college sponsored the first winter session, corresponding to summer schools in cooler localities. There is a professor of books, the first of this character to be established in an American institution. President, Hamilton Holt, Litt D, LL D.

ROLSHOVEN, JULIUS (1858-). An American painter and teacher, born at Detroit,

and educated at Cooper Union and the Plattsman Academy in New York City. He also studied with Hugo Crola at Dusseldorf Academy, with Loffitz at Munich, in Frank Duveneck's class at Florence, and in the Atelier Toney in Paris; Robert Fleury and Bouguereau were among his teachers in Paris. He founded the Rolshoven life classes in Paris and London with international attendance and was awarded honors and medals in Munich, Paris, Brussels, Berlin, Florence, Chicago, Buffalo, and St. Louis, "The Chioggia Fishing Girl" and two of his etchings are in the Cincinnati Museum, and "The Refectory of San Damiano, Assisi," is on exhibition at the Detroit Institute.

ROLVAAG, OLE EDVART (1876-). An American teacher and author. He was born at Rolvaag, Hegeland, Norway, and came to the United States at the age of 20. He studied at Augustana College, Canton, S. Dak., and St. Olaf College, Northfield, Minn. (B.A., 1905). He then spent a year at the University of Norway. Since 1906 he has been professor of the Norwegian language and literature at St. Olaf College. He is the author of *Ordforklaring* (1909); *Amerikabreve* (1912); *Paa Glemte Lee* (1914); *Deklamationsboken* (1918); *To Tullinger* (1920); *Laengselens Baat* (1921); *Riket Grundlaegges* (1925); *Norsk Læsebok* (1919-25); and *Giants in the Earth* (1927).

ROMAINS, JULES (1885-). Pseudonym of Louis Farigoule, French man of letters, who was educated in the French universities and then became professor of rhetoric at a provincial lycée. In the meantime, under his literary pseudonym, he acquired a reputation as one of the most vigorous writers of the younger generation, accepting the label *Unanimité* to denote the school of writing which he championed. This appellation implied an all-pervading sympathy and participation in the "collective consciousness" of the sociologists. Romain wrote the following volumes of poetry *Amour, Couleur de Paris, Odes et Prières; La Vie Unanime* (1908); *Un être en marche* (1910); *Europe* (1919); *Le voyage des amants* (1920), and *Les chants de dix années* (1928). His prose works and novels include *Le bourg régnère, conte de la vie unanime* (1906), *La mort de quelqu'un* (1911); *Les copains* (1913), *Le vin blanc de la Villette* (1914); *Puissances de Paris* (1919); *Lucienne* (1920), and a series *Le dicu des corps*. In addition, he wrote the plays *L'armée dans la ville* in verse (1911); *Cromdeyre-le-Vieil* (1920); *M. le Trouhadec saisi par la débauche* (1924); *Knock*, a very successful comedy (1924); and *Le dictateur, Démétrus* (1926).

ROMAN CATHOLIC CHURCH. In the period including 1914-29, three Popes reigned. The gentle, spiritual, peasant pontiff, Joseph Sarto, whose aim was "to restore all things in Christ," died of a broken heart in August, 1914, when the War brought international chaos. Giacomo Della Chiesa, "the Peacemaker," who was elected his successor on Sept. 3, 1914, combined the grace of his predecessor with the statesmanship of the great Leo XIII and adopted the ideals and policies of both. The internal affairs of the church received his constant attention. Among the special results were the promulgation of the new Code of Canon Law (June 28, 1917), and the encyclicals on preaching; true family life; the Bible; Dante; and social welfare work. The revocation of the rule in regard to visits of foreign officials to the Quirinal,

was followed by the ceremonial calls at the Vatican of the rulers of Spain and England (1923) and President Wilson (Jan. 4, 1919). His official acts followed each other so swiftly that their full influence and significance were barely appreciated when he died on Jan. 21, 1922.

The American cardinals were too late to vote at the conclave that elected Cardinal Achille Ratti his successor as Pius XI. Cardinal Farley happened to be in Europe when Benedict XV was elected and so was the only American cardinal who ever voted for a Pope. This, however, will not happen again, for by order of Pius XI, the time limit for the opening of the conclave has been extended to 15 days to enable the foreign cardinals to arrive in Rome. The new Pope, understanding English and having intimate family and social connection with America, and having lived in England and acted as a diplomat in central Europe, was especially well equipped to take up the renewed appeal for a peaceful adjustment of the discord of the nations on a basis of justice, not force. His wide experience as a student and critical historian was frequently shown in his discourses and encyclicals, notably those on St. Francis de Sales (Jan. 30, 1923), St. Thomas (June 29); St. Bernard (August 20), St. Columbanus (August 4); Sœur Thérèse, "the Little Flower" (February 11); the Jesuit Robert Bellarmine (May 19); and the letter of thanks to the American hierarchy (September 8), for their aid to the Papal Relief Expedition to Russia. This expedition he placed in charge of the American Jesuit, the Rev. Edmund A. Walsh, Regent of the School of Foreign Service at Georgetown University. It distributed more than \$1,000,000 until its operations ceased because of the attempt of the Bolsheviks to use it to force the Vatican to recognize the Soviet government (Nov. 14, 1923). Pius XI took occasion, on Nov. 14 and Dec. 10, 1923, to reaffirm his great interest in the reconciliation of the churches of the Eastern rites, and officially announced a projected reopening of the Vatican Council of 1869 and that the Holy Year would be proclaimed on Dec. 30, 1924, as the twenty-second general jubilee. The year closed with the encyclical permitting the acquiescence of the French Episcopate in the new association laws which make the position of the church in France more stable in the eyes of the law and therefore more satisfactory. Other encyclicals issued by this Pope were: That on the French diocesan associations (Jan. 18, 1924); the establishment of the new feast of Christ the King (Dec. 11, 1925); on Catholic missions (Feb. 28, 1926), on the celebration of the seventh centenary of St. Francis of Assisi (Apr. 30, 1926), on the persecution of the Catholics of Mexico (Nov. 18, 1926); on the promotion of religious unity (Jan. 6, 1928); and on Devotion to the Sacred Heart (May 9, 1928). On Jan. 6, 1929, he published a bull instituting a general jubilee in honor of his Sacerdotal Golden Jubilee and urging an increased zeal in the spread of the faith.

The following new saints were canonized: John Endes, and John Baptist Vianney, May 31, 1925; M. Sophie Barat and Mary Magdalene Postel, May 24, 1925; Peter Canisius, May 31, 1925; and Thérèse Martin of Lisieux, May 17, 1925; the eight Jesuit martyrs of North America: Jogues, Goupil, de Brébeuf, Lalemant, Daniel, Garnier, Charbanel, and de la Lande were beatified June 21, 1925; the venerable Don Bosco,

founder of the Salesian Fathers, on June 2, 1929; the venerable Claude de la Columbière, S.J., on June 16, and Cosma da Carboniano, the Armenian martyr, on June 23 of the same year. The general jubilee year ended Dec. 24, 1925, during which 983 pilgrimages visited Rome, including about 500,000 persons. Three International Eucharistic Congresses were held: Amsterdam, July, 1924; Chicago, June, 1926 (one of the greatest ecclesiastical functions in the history of the church); and Sydney, N. S. Wales, September, 1928.

The relations between the Vatican and the Italian government were on a somewhat more cordial basis and early in 1929 the world was surprised by the announcement that the 60-year-old controversy between the Vatican and the Italian State had been settled. A treaty of conciliation was signed in the Lateran Palace on February 11, and the affirmation of the Pope as a temporal ruler was ratified on June 7. See LATERAN TREATY.

The Pope during these years gave a new impulse to the work for the missions, checked the growth of excessive nationalism, and promoted the cult of international harmony.

The Hierarchy. The official data of the Catholic hierarchy show that 92 cardinals died during the 1914-29 period, and 34 during the term of Pius XI, reducing the total membership to 58 in which the Italians numbered only 26, an unprecedented minority. The administration of the church was entrusted to 14 patriarchs; 245 archbishops and 908 bishops with residential sees; 57 abbacies; 331 apostolic vicars; and 600 titular bishops.

The religious bodies of men make up 37 monastic orders; 17 mendicant orders, 8 orders of clerics regular, 66 ecclesiastical congregations, and 10 religious institutes. The Holy See was represented abroad by 50 pontifical delegates, 24 nuncios, 4 internuncios, 1 chargé d'affaires, and 21 apostolic delegates. Foreign representatives at the Vatican numbered 11 embassies and 18 ministers. The new cardinals created in 1914-29 numbered 64, among whom were included: Dougherty of Philadelphia, Sharretti, Schulte, Ratti (Pope Pius XI), Dubois, Begin of Quebec, Laurenti, Hayes of New York, and Mundelein of Chicago.

In the United States, 93 new bishops were appointed, and 74 died. Seven new dioceses, El Paso, Grand Island, Kearney, Lafayette, Springfield (Ill.), Amarillo, Tex., and Raleigh, N. C., were organized. The new archdiocese of San Antonio was created and the title of Oregon City changed to Portland. The older generation of the hierarchy disappeared in the passing away of Cardinals Gibbons and Farley; Archbishops Riordan, Quigley, Spalding, Blenk, Prendergast, Keane, and Kennedy, rector of the American College; and Bishops McFaul, Chatard, Hennessy, Beaven, Foley, Harkins, McDonnell, O'Gorman, Kudelka, Donahue, Burke, Gabriels, Ryan, Ward, Corrigan, O'Leary, and Byrnie. Most of the new bishops were comparatively young men. A radical departure in the selection of candidates for vacant American sees was enacted by the Pope (1916). The old procedure of voting for three names at diocesan convocations was abolished; a permanent list of eligibles was to be filed in Rome every two years, made up of names submitted by the bishops of the United States of those they regard as most worthy to be their successors.

Archbishop Fumassi-Biondi assumed the office of apostolic delegate at Washington (Mar. 6, 1923), in succession to Mgr. Falconio, who was created a cardinal, and Archbishops Dougherty, Shaw, Mundelein, Hayes, Curley, and Daeger were added to the Metropolitans.

Statistics. The *Official Catholic Directory* for 1929 gives these statistical totals for the United States: 17 archbishops, of whom 4 are cardinals; 104 bishops, 18,370 diocesans and 7403 priests of religious orders, an increase of 352 and 228, respectively, over the previous year; 11,903 churches, increase 204; 136 seminaries with 14,686 students, increase 254. 7063 parish schools with 2,488,682 pupils; 237 colleges for men, 734 academies for girls, and 357 orphanages with 54,350 inmates. The total estimated Catholic population is 20,112,758, a gain of 423,709 over the previous year. Frequent complaint was made that owing to faulty and unscientific methods of computation, this total of the Catholic population is an underestimate, and it is contended that the total should be more than 22,000,000. Seventy per cent of the Catholic population is in 12 States, and the remaining 30 per cent is widely scattered over the others. There are 2230 congregations made up of non-English-speaking people.

The *Catholic Directory* for England gives the Catholic population of England and Wales in 1928 as 2,156,146 with 5310 priests and 2183 churches and chapels. The Catholics of the British Empire numbered 15,300,000, and the grand total for English-speaking countries was 50,000,000. There were 335,000,000 Catholics in the whole world, of whom about 6,600,000 were not of the Latin Rite. In England and Wales, there were 4 archbishops and 14 bishops, in Scotland, 2 archbishops and 4 bishops; in Ireland, 4 archbishops and 24 bishops. In the British Empire, there were 33 archbishops and 118 bishops; 55 vicariates; and 13 prelates apostolic. The Catholics in Ireland numbered 3,500,000.

In August, 1917, the Catholic hierarchy organized the National Catholic War Council to promote the spiritual and material welfare of Catholics in the service of the Government and to direct and assist all Catholic activities incident to the War. It coordinated the efforts of 9714 Catholic men's and 4959 Catholic women's organizations for this purpose. When hostilities ceased, this body was continued as the National Catholic Welfare Council, at a meeting of the hierarchy held on Sept. 24-25, 1919, from which was issued a pastoral letter setting forth the problems of necessary social reconstruction. The name, however, was changed in the following year, on advice from Rome, to the National Catholic Welfare Conference, under which title it continued its work for social action, education, immigration welfare, and the proper and advantageous solution of other industrial and economic problems affecting the Catholic population, and which are discussed at annual meetings of the bishops held in Washington. On Nov. 27, 1917, Cardinal Hayes, then bishop auxiliary of New York, was appointed by the Pope chaplain bishop of all the United States forces and so served during the War. He had under his jurisdiction, when the Armistice was signed, 1023 chaplains in active service and 500 approved in the reserve list. The Catholic quota allowed by the Government was 37.8 per cent of the whole corps.

The welfare work in the camps was in the hands of the Knights of Columbus who were

given funds for war-service work to the amount of \$43,000,000, and expended in this cause, from June 16, 1917, to Oct. 7, 1923, a total of \$37,250,000. The balance was devoted in the years following to social reconstruction work and education and care for disabled service men. The membership of the Knights of Columbus in 1929 was 637,127, organized into 2544 separate councils, distributed through 61 States and 2 territorial jurisdictions.

ROME. The capital of the Kingdom of Italy. The population in 1928 was estimated to be 877,289. Rome has shown the greatest progress of all the Italian cities under the Fascist form of government. In 1925 a new form of municipal government was decided on by the cabinet council, and the administration of the city was entrusted to a government appointee nominated by royal decree, the Governor of Rome. At first, the governor was assisted by two vice governors, 10 rectors, and 80 consultants, also appointed by royal decree. To the governor were entrusted the powers hitherto possessed by the mayor, the board of aldermen, and the municipal council; the vice-governors were empowered at his request and under his responsibility to perform part or the whole of his duties. The rectors were technicians to whom were entrusted duties under the governor's responsibility in the various branches of the city administration. The consultants acted in an advisory capacity, their opinion being especially necessary on all important matters affecting the city finances. In 1928 the powers of the governor were made still more arbitrary with the abolition of the board of rectors and one of the vice governorships. The board of consultants was reduced to 12 members appointed by the Ministers of the Interior and of Municipalities. The reason for this change was the necessarily close connection between the purely communal interests of the city and the interests of the nation as a whole.

On Apr. 21, 1926, on the occasion of the inauguration of Rome's first governor, Premier Mussolini gave to the city his "regulatory plan" of its reconstruction within a fifteen-year period. The principal feature of the plan was the resurrection of the ancient part of Rome and the restoration of its former grandeur. It envisaged the building of a ring of boulevards and the creation of new squares and parks so as to add to the beauty of the Eternal City, the construction of new palatial government buildings; the demolition of houses so as to leave open space around the Augusteo Amphitheatre, Marcellus Theatre, Capital, Pantheon, and Victor Emmanuel Monument; the excavation of the Circus Maximus and the forums of Augustus, Vespasian, Nerva, and Trajan; and the erection in the centre of Rome of a new forum known as the Forum of Mussolini. The inspiration for this restoration is found in the new Museum of the Roman Empire, housed in the ancient Convent of Saint Ambrosia, whose exhibits portray in minute detail the life of the city of the Cæsars. In 1926 the Cabinet Council voted 60,000,000 lire annually to the City of Rome as the Government's contribution toward its restoration.

Mussolini's plan also included the conversion of Rome into a modern metropolis. It called for the adoption of a zoning scheme whereby the city would be divided into business, industrial, and residential sections; the construction of a subway system under the famous Seven Hills; the erection of model tenements in the new indus-

trial centre to the south and southeast of the city; and the construction of main thoroughfares to coördinate means of communication with the environs. The subway system, which has been under construction since 1927, will consist of three lines, one running east and west, another north and south, and the third diagonally, and will be approximately 24 kilometers (14.9 miles) in length. The terminals will lie in the new residential sections on the outskirts of the city.

In 1927 the Institute for the People's Houses in Rome, in cooperation with local and national officials, had erected 10,878 dwellings with accommodation for 55,000 persons. The programme called for the construction of several thousand more so as to house 100,000 persons. More than half of these dwellings had been built since 1922, with State aid. The value of the institute's holdings in 1927 was approximately 500,000,000 lire.

A third great improvement has been the construction of Rome's \$1,000,000 airport at Littorio covering more than one square mile. Its two-story hangar is capable of housing 200 planes. Toward the construction of the field, the Italian government contributed \$100,000. Many streets are being widened and others are being cut through the centre of Rome so as to relieve traffic congestion; among these are the Via del Tritone and the new thoroughfare connecting the Piazza Barberini and the principal railroad station. The grave of Italy's Unknown Soldier is under the Altar of the Country at the base of the Victor Emmanuel Monument.

RONALD, SIR LONDON (1873-). A British conductor, born in London. He studied at the Royal College of Music under F. Taylor, Sir H. H. Parry, Sir C. V. Stanford, and Sir W. Parratt. After a successful début in London as pianist (1890), he accepted the position as second conductor at Covent Garden (1891-94) and was conductor of Sir A. Harris's Italian Opera Company on tour (1894). In 1894-95 he traveled in the United States as accompanist to Mme. Melba. During 1898-1902, he was conductor at the Lyric Theatre in London, and began a series of symphony concerts at Blackpool, which attracted attention, so that, when the London Symphony Orchestra was established in 1907, he was invited to conduct a number of its concerts. His great reputation was made in 1908-09, when he made a tour of Germany, Austria, Holland, and Italy as guest-conductor of some of the world's famous orchestras. As a result, he was chosen on his return, in 1909, as permanent conductor of the New Symphony Orchestra (since 1920 the Royal Albert Hall Symphony Orchestra). In 1916-20 he also conducted the concerts of the Scottish Orchestra in Edinburgh. In 1910 he accepted the appointment as principal of the Guildhall School of Music, which under his administration not only raised its musical standard but also enlarged its scope by the introduction of general culture courses. He was knighted in 1922. Because of poor health, he resigned all positions in 1928.

RÖNTGEN RAYS. See **PHYSICS**.

ROOP, JAMES CLAWSON (1888-). An American financial officer, who was born in Nebraska and educated at the University of Pennsylvania (B. S., 1909). During the World War, he was a lieutenant of engineers, serving as a supply officer in England in 1918. In 1919 he was promoted to the rank of lieutenant colonel and appointed chief of the Purchasing Division

in France. Returning to the United States, he became First Assistant Director of the Budget under General Charles G. Dawes. In 1929 he succeeded General Herbert Mayhew Lord as Director of the Budget.

ROOSEVELT, FRANKLIN D(ELANO) (1882-). An American lawyer and public official, born at Hyde Park, N. Y., and educated at Harvard University and the Columbia University Law School. In 1907 he was admitted to the bar. He was active in Democratic politics and a member of the State Senate in 1910, but resigned in 1913 on his appointment as Assistant Secretary of the Navy, which he held until 1920. In that year, he was Democratic nominee for vice president. During the World War, he acted as inspector of the United States Naval forces in European waters and was in charge of demobilization in Europe in 1919. Although not an active candidate in the Democratic Convention of 1924, he was prominent in the proceedings of that body. In the convention of 1928 at Houston, Tex., he made the speech placing Gov. Alfred E. Smith in nomination for the Presidency. Later in the campaign, he was himself nominated for Governor of New York and elected, running ahead of the Democratic national ticket. He wrote *The Happy Warrior: Alfred E. Smith* (1928). He received honorary degrees of LL.D. from Harvard and Dartmouth in 1929.

ROOSEVELT, THEODORE (1858-1919). A former President of the United States (see Vol. XX). In 1914 he conducted an exploring expedition in Brazil, where he endured many hardships. The most spectacular episode of this journey was the descent of the so-called River of Doubt, which had hitherto been practically unexplored. This river was renamed for him the Rio Teodoro. At the outbreak of the World War, his sympathies with the Allies were emphatically and repeatedly expressed. He strongly denounced the policy of strict neutrality laid down by President Wilson and pointed out the danger to the United States if Germany won. In 1916 he supported Charles E. Hughes for President. As soon as the United States had declared war, he offered to raise a division and to lead it into France. President Wilson refused this offer on the ground that it would be inexpedient to give a civilian practically inexperienced in large military operations such an important command. All of his four sons served during the War. Theodore, Jr., with the infantry in France, rose to the rank of lieutenant colonel. Kermit served with the British Royal Artillery in Mesopotamia until he was transferred in July, 1918, to the American Artillery in France. Archibald rose to the rank of captain. Quentin, the youngest, entered the Air Force and was killed in an air fight in July, 1918. After a short illness, Theodore Roosevelt died in his sleep, on Jan. 6, 1919. Following his death, many books relating to him were published. These included his letters to his children and to others and many reminiscences. He had published in 1916 *A Booklover's Holiday in the Open*. Joseph Bucklin Bishop edited two volumes of his letters (1920) and Mrs. Cornelia Roosevelt Robinson wrote *My Brother, Theodore Roosevelt* (1921).

ROOSEVELT, THEODORE, JR. (1887-). An American public official, born at Oyster Bay, N. Y., the son of Theodore Roosevelt. He was educated at Harvard University. He was for

several years engaged in business, but at the outbreak of the World War was commissioned major of the 26th Infantry, U. S. Army. He was promoted to be lieutenant colonel in September, 1918. He took an active part with his regiment in campaigns in France, including the Meuse-Argonne and the St. Mihiel offensives. He received the Distinguished Service Cross and the Croix de Guerre. In 1919 he was active in the organization of the American Legion. He was elected to the New York Assembly in 1919 and served for one year. In 1921 he was appointed Assistant Secretary of the Navy and resigned in 1924 to become the unsuccessful Republican candidate for Governor of New York. He took part in Asiatic scientific expeditions for the Field Museum of Chicago in 1925 and 1928-29. In 1929 he was appointed Governor of Porto Rico by President Hoover. He is the author of *Average Americans* (1919); (with his brother Kermit) *East of the Sun and West of the Moon* (1926); *Rank and File* (1928); and *All In The Family* (1929).

ROOT, ELIHU (1845-). An American statesman (see Vol. XX). In 1917 he headed a special diplomatic commission sent by President Wilson to Russia. He formulated the plan for the Permanent Court of International Justice, established in 1921. He was Commissioner Plenipotentiary for the United States at the Washington Disarmament Conference (1921-22). He was awarded the Woodrow Wilson Foundation Medal and Prize in 1926 for his championship of the Court of International Justice. In 1929, when nearly 84 years old, he accepted membership on a committee of international jurists appointed by the League of Nations to consider revision of the World Court statute of 1920, the object being to secure the participation of the United States. In 1918 he became chairman of the United States Government War Savings Investment Society. His later writings include: *Addresses on International Subjects* (1916); *Addresses on Government and Citizenship* (1916); *Military and Colonial Policy of the United States* (1916); *Latin-America and the United States* (1917); *Russia and the United States* (1917); *Miscellaneous Addresses* (1917); *Men and Politics* (1924).

ROOTS. See BOTANY.

ROPSHIN. See SAVINKOV, BORIS.

ROSE, JOHN HOLLAND (1855-) An English historian (see Vol. XX). Vere Harmsworth professor of naval history at Cambridge University since 1919. He was coeditor of the *Cambridge History of the British Empire*, contributed articles to various reviews, and wrote *Nationality as a Factor in Modern History* (1916); *Lord Hood and the Defense of Toulon* (1922); and *The Indecisiveness of Modern War* (1927).

ROSENAU, rôze-nou, MILTON JOSEPH (1869-) An American physician and sanitarian (see Vol. XX). He was director of the School of Public Health of Harvard University and the Massachusetts Institute of Technology (1913-22) and director of the antitoxin and vaccine laboratories of the Massachusetts State Board of Health (1914-21). He wrote *Preventive Medicine and Hygiene* (1921).

ROSENOW, EDWARD CARL (1875-). An American pathologist and bacteriologist, born at Alma, Wis., and educated at Rush Medical College. He became a member of the teaching body in the department of internal medicine at Rush and was made an assistant professor of medicine

as well as a member of the research staff of the Institute of Infectious Diseases. These positions he left in 1914 to fill the chair of experimental bacteriology in the Mayo Foundation at Rochester, Minn. In Chicago, he had played a notable rôle in the study of focal infection and especially of the selective action of bacteria in attacking certain tissues to the exclusion of others. This line of research he also followed with great success at the Mayo clinic, making it increasingly apparent that infection from slight deposits of pus is responsible for a very large amount of chronic ailments formerly attributed to natural regressive change in the vital organs. The writings of Dr. Rosenow are scattered throughout periodical literature.

ROSENSTOCK, JOSEF (1895-). An Austrian conductor and composer, born in Cracow. He began his studies at the conservatory of his native city and completed his musical training at the Vienna Conservatory under Lalewicz (piano) and Schreker (composition). In 1920 he began his career as second conductor of the Vienna Philharmonic Chorus, the next year went to Stuttgart as assistant conductor at the opera, and in 1922 became first conductor in Darmstadt, succeeding Balling in 1925 as general musical director. Two years later, he exchanged that post for a similar one at the Staatstheater in Wiesbaden. In 1929 he was called to the Metropolitan Opera House, New York, as conductor of German opera, but resigned later in the year. His compositions include *Ouverture zu einem heiteren Spiel*; *Symphonisches Vorspiel*; a piano concerto; *Doppelfuge* for two pianos; a piano sonata.

ROSENWALD, JULIUS (1862-). An American merchant-philanthropist (see Vol. XX). Until 1925 Mr. Rosenwald was president of Sears, Roebuck & Co., of Chicago. Since that year, he has been chairman of the board. In the World War, he was appointed by President Wilson a member of the Advisory Commission of the Council of National Defense and chairman of the committee on supplies. In 1918 he was on a special mission to France for the Secretary of War, and a member of the Second National Industrial Conference in 1919. He has contributed generously toward the erection of Y M C. A. and Y. W. C. A. buildings for the colored race in 15 cities and to the cost of 4000 rural public schools for Negroes in the South. He also pledged \$3,000,000 for an Industrial Museum in Chicago and \$2,000,000 for Jewish colonization work in Russia. He is interested in promoting plans by which persons in moderate circumstances may have medical attendance at a minimum of expenditure and in various philanthropic causes.

ROSE POLYTECHNIC INSTITUTE. A school of engineering, founded in 1874 at Terre Haute, Ind., and opened for students in 1883. The student enrollment increased from 192 men in 1914 to 274 in 1927-28, the faculty from 14 to 20 members in the autumn of 1928, and the productive funds from \$800,000 to \$1,500,000 in 1927-28, for which year the income was \$110,000. The library in 1928 contained 15,000 volumes. In September, 1922, the institute moved to a site three miles outside the city with new buildings and greatly improved equipment in shops and laboratories, and in 1926 a dormitory accommodating 52 students was erected. Frank C. Wagner, A.M., D.Sc., D.Eng., president, died in November, 1928, after serving five years as the head of the institute.

ROSNY, rôné', J. H. Pseudonym of the brothers HENRY (1856-) and JUSTIN (1859-) Boëx, French writers (see VOL. XX). The later works of Henry, signed "J. H. Rosny, aîné," include *Perdus?* (1916); *L'énigme de Gioveuse* (1917); *Le félin géant* (1920); *Torches et lumignons*, literary souvenirs (1921); *Dans la nuit des cœurs* (1922); *L'assassin surnaturel* (1924); *L'amour d'abord* (1924); *Les femmes des autres* (1925); and *Mémoires de la vie littéraire* (1927). Those of Justin, "J. H. Rosny, jeune," were *Fanchon-la-Belle* (1921); *La Courtisane triomphante* (1925); *La métisse amoureuse* (1927); *Les Furies* (1928), and *Wilhelm II* (1928).

ROSS, EDWARD ALSWORTH (1866-) An American sociologist (see VOL. XX). He continued as professor of sociology at the University of Wisconsin. His later books include *The Old World in the New* (1911), *South of Panama* (1915); *Russia in Upheaval* (1918); *What is America?* (1919); *The Principles of Sociology* (1920); *The Russian Bolshevik Revolution* (1921); *The Social Trend* (1922); *The Social Revolution in Mexico* (1923); *The Outlines of Sociology* (1923); *The Russian Soviet Republic* (1923); *Roads to Social Peace* (1924); *Civic Sociology* (1925); *Standing Room Only?* (1927).

ROSS, SIR EDWARD DENISON (1871-). An English Orientalist (see VOL. XX). In 1916 he became director of the School of Oriental Studies, London Institution, and professor of Persian in the University of London. He was knighted in 1918 and the Order of the Nile (2d class) was conferred in 1920. His later publications include *Life and Times of Omar Khayyam, Islam, Eastern Art and Literature* (1928), and contributions to the *Cambridge History of India*.

ROSS, SIR RONALD (1857-). A British physician (see VOL. XX). In 1918 Dr Ross was knighted. His experience with malaria during the World War is summed up in a work which he edited, *Observations on Malaria by Medical Officers with the Army* (1919). His *Memoirs of Sir Ronald Ross* (1923) gives the entire summary of his experiences in fighting malaria. After the War, he became director of the Ross Institute and Hospital for Tropical Diseases, London.

ROSS DEPENDENCY. The Ross Dependency was created by Great Britain by an order in council on July 30, 1923. The order states that "That part of His Majesty's Dominions in the Antarctic Seas, which comprises all the islands and territories between the 160th degree of East Longitude and the 150th degree of West Longitude which are situated south of the 60th degree of South Latitude shall be named the Ross Dependency." It further appoints the Governor General of New Zealand to be the Governor of the Ross Dependency, with power to make rules and regulations, and grants and dispositions of any lands which may lawfully be granted or disposed of by His Majesty. With the Falkland Islands Dependencies, Great Britain possesses practically one-third of the Antarctic south of 60° South Latitude. The present economic value of the Dependency lies in its rich sea life, the Ross Sea being one of the centres of the Antarctic whaling industry. The 1923-24 season yielded 17,000 barrels of oil. The routes of the Amundsen and Scott expeditions to the South Pole were within this territory, as is the Bay of Whales base of the Byrd Antarctic Expedition of 1928.

ROSTAND, rôstän', EDMOND (1868-1918). A French dramatist and poet (see VOL. XX). During the World War, he devoted himself chiefly to the writing of patriotic verse. Among his volumes of verse are *Musardises*, *Le Vol de la Marseillaise*, and *Le cantique de l'aile*, a posthumous publication (1922), as was also *La dernière nuit de Don Juan*, a dramatic poem (1921).

ROSTAND, MAURICE (1891-). A French author born at Cambo, the son of Edmond Rostand (see above). He is a prolific writer of poetry, novels, and plays in verse and prose. His works include *Un bon petit diable*, a play written with his mother Rosemonde Gérard Rostand (1912); *Le cercueil de cristal*, a novel (1920), the plays, *Le Phénix* (1923), *Le secret du Sphinx* (1924), *L'Archange* (1925), *La déserteuse* (1926); the novels, *L'Homme que j'ai tué* and *L'Ange du suicide* (1926); and *Napoléon IV* (1928), a play which nearly caused a diplomatic incident between France and England because he made Queen Victoria responsible for the death of the Prince Imperial in the Zulu War.

ROSTAND, ROSEMONDE GÉRARD (1871-). A French writer (see VOL. XX). In 1926 she wrote *La vie amoureuse de Madame de Genlis* in the series *Leurs Amours*.

ROTHENSTEIN, rô'then-stin, WILLIAM (1872-). An English portrait, figure, and landscape painter (see VOL. XX). He was professor of civic art at Sheffield University (1917-26) and principal of the Royal College of Art, South Kensington, after 1920. Continuing active in his art after 1914, his works found their way into the leading museums of Great Britain, America, and the British dominions. To his publications he added, *Six Portraits of Sir Rabindranath Tagore* (1915); *A Plea for a Wider Use of Artists and Craftsmen* (1917), *24 Portraits* (1920, 2d series, 1923); *Ancient India*, with K. de B. Codrington (1926).

ROTHERMERE, rôth'ër-mër, RT. HON. HAROLD SIDNEY HARMSWORTH, FIRST VISCOUNT (1868-). An English newspaper proprietor (see VOL. X, HARMSWORTH), brother of Viscount Northcliffe. He was associated with the latter in his newspaper enterprises and was director general of the Royal Army (Clothing Department (1916-17), and Air Minister (1917-18). He endowed a chair of Naval History at Cambridge, and a chair of American History at Oxford. Following the death of his brother, he succeeded to the management of the *Daily Mail*, the *Evening News*, *Daily Mirror*, and the *Weekly Dispatch*.

ROTTERDAM. The second city in size and the chief commercial port of the Netherlands. The population, according to the census of 1920, was 510,538 and, according to the communal population lists for Dec. 31, 1927, 571,842. The area through the annexation of neighboring suburbs was increased to 62 hectares (153.2 acres). The new West End section is a model of modern town planning. In 1919 the National Technical Nautical Museum was opened; it comprises a unique collection of objects pertaining to the technical side of shipping and shipbuilding. In 1923 the Boymans Museum acquired the former library building as an annex for the exhibition of its collection of modern paintings and sculpture. The new Town Hall, or Stadhuis, erected between 1914 and 1920, is an imposing building, constructed principally of limestone, with a

frontage of more than 260 feet. The great tower, 246 feet high above the central hall, serves, in accordance with national tradition, as a bell tower. Another example of modern Dutch architecture is the new Post and Telegraph Office Building, which was erected at a cost of nearly 5,000,000 guilders.

The port of Rotterdam covers an area of 1125 acres. The total length of its quays is 17 miles, in addition to which there are about 10 miles of buoy berths. The principal of the large harbors on the left bank of the River Meuse are the Rhine, the Meuse, and the Waal. On the right bank of the river are the Schie, Yssel, Lek, Keile, and the newly constructed Merwe harbors. Several other harbors are in course of construction. There are 31 shipbuilding yards which together have 113 shipways for the building of ocean vessels and 15 floating docks for repair work. The largest of these docks has a lifting capacity of 40,000 tons.

For grain transport, the port of Rotterdam possesses 27 floating elevators with a capacity of 150 to 300 tons per hour. It is also a first-class petroleum harbor, its extensive tank grounds stretching along the river for 1¼ miles. In 1928 Dutch engineers completed widening the River Noord, part of the waterway connecting the Rhine and Amsterdam, to 200 meters (656 feet) throughout its entire length. The accompanying table shows the figures for the seagoing ships entering the harbor of Rotterdam:

Year	No of Ships	Net Register Tonnage	Percentage of traffic of Dutch Ports (Net Register)	
			Number	Tonnage
1914	7,303	9,223,817	58	68
1915	3,644	4,153,682	57	63
1916	2,979	3,183,032	58	68
1917	1,374	1,299,384	63	70
1918	1,048	1,215,203	59	73
1919	4,328	5,047,742	61	71
1920	5,601	7,319,204	50	64
1921	7,475	10,366,333	53	62
1922	8,012	11,967,356	51	64
1923	7,797	11,161,328	47	58
1924	9,539	14,539,334	51	62
1925	10,951	16,658,286	53	62
1926	14,377	21,176,099	50	58
1927	13,060	21,087,405	53	63

In 1927, 2072 of these ships were Dutch, 2928 British, 2445 German, 1131 French, and 203 of the United States. The merchandise traffic from the Rhine, in tons of goods, was:

Year	Inward Clearances	Outward Clearances	Percentage of the traffic of the Kingdom
1913	7,024,259	15,739,982	81 47
1917	1,371,393	73,573	44 35
1918	1,007,837	27,577	35 67
1919	1,469,474	2,059,964	70 06
1920	3,024,944	3,476,325	70 78
1921	4,206,562	4,570,629	75 78
1922	3,141,158	8,453,736	74 09

1925	11,591,932	11,252,917	73 20
1926	22,081,133	10,320,680	77 15
1927	15,266,362	18,001,835	76 47

Rotterdam's admirably equipped airport at Waalhaven functions as the centre for various international air services.

ROUAULT, GEORGES (1871-). A French painter, engraver, and lithographer, born in Paris, and curator of the Gustav Moreau Museum of that city. His chief works, which have established his position as one of the greatest visionaries of contemporary art, are "L'Enfant

Jesus parmi les docteurs," a painting; "Tête de vieille femme," an engraving; "Paysage," a pastel; and "Minerve et Guerre."

ROUSSEL, rō'sèl', ALBERT (1869-). A French composer, born at Tourcoing. Although he received systematic instruction on the piano and organ at an early age, he did not think of following music as a career, but prepared himself for the navy, which he entered in 1887. On board ship, he made his first attempts at composition and became convinced of the necessity of serious study. After receiving a favorable verdict on some compositions he had submitted to Koszul, the director of the Conservatory at Roubaix, he resigned from the navy in 1893 and began his theoretical studies under Koszul. Later, he went to Paris, where he studied organ under Gigout and composition at the Schola Cantorum under d'Indy. After graduation in 1902, he taught counterpoint there until 1913. His compositions impress through their admirable technical workmanship and brilliant orchestral color, rather than through originality or spontaneity of invention. His principal works are an opera, *La Naissance de la Lyre* (Paris, 1925), two ballets, *Le Festin de l'Araignée* (1913) and *Padmavati* (1922); two symphonies, *Le Poème de la Forêt* and *In Rh*; a symphonic prelude, *Résurrection*; three symphonic sketches, *Évocations*; an orchestral suite in F; a piano concerto, *Psalm LXXX*, for tenor, chorus, and orchestra; incidental music to Jean-Aubrey's *Le Marchand de Sable qui passe*; pieces for piano and songs.

ROVE TUNNEL. See TUNNELS.

ROWE, LEO S (TANTON) (1871-). An American economist (see VOL. XX). He was general secretary of the International High Commission (1915-17) and delegate to several Central American and South American conferences. He was Assistant Secretary of the Treasury (1917-19) and chief of the Latin-American Division of the State Department in Washington (1919-20). In September, 1920, he became director general of the Pan-American Union. He was U. S. delegate to the Fifth International Conference of American States at Santiago in 1923 and chairman of the U. S. delegation to the Pan-American Scientific Congress at Lima, Peru, 1924-25. His later publications include *Problemas Americanos, conferencias* (1915); and *The Federal System of the Argentine Republic* (1921).

ROWING. Rowing as a competitive sport originated in England among the boating clubs early in the nineteenth century and now ranks as one of the most popular sports, not only in the country of its origin but also in Germany, Belgium, Italy, France, Canada, and the United States. The oldest rowing fixture of importance is the Henley Regatta which was founded at Henley-on-Thames in 1839. The annual contests between Oxford and Cambridge universities date from 1829.

In the United States the decidedly outstanding competition is the Intercollegiate Regatta held yearly on the Hudson River, near Poughkeepsie, N. Y. The American Henley on the Schuylkill, near Philadelphia, the Childs Cup race on Lake Carnegie, Princeton, N. J., and the Yale-Harvard contests on the Thames, Connecticut, are other highly regarded rowing tests in the United States.

In the Oxford-Cambridge races, a string of five consecutive victories has been scored by

Cambridge since 1924. Oxford, however, can point to nine triumphs in a row in the period 1861-69 and the same number during 1890-98. The University of Washington captured the intercollegiate on the Hudson in 1923, 1924, and 1926, while the U. S. Naval Academy was victor in 1925, Columbia in 1927 and 1929, and California in 1928. Yale has conquered Harvard in their annual clashes seven times out of nine during 1920-28.

ROYCE, JOSIAH (1855-1916). An American philosopher (see VOL. XX). During the early years of the World War, he was active in his denunciation of the German cause. He was honored on his sixtieth birthday by a testimonial volume of philosophic essays written by his former students. Of his works published after 1914, *The Hope of a Great Community* appeared during his lifetime (1915). It dealt with one of his favorite themes, community loyalty. *Lectures on Modern Idealism* was published posthumously (1919) under the editorship of Professor Lowenbeig.

ROYDEN, AGNES MAUDE (1876-) A British evangelist, who was educated at Cheltenham Ladies' College and Lady Margaret Hall, Oxford, where she studied philosophy. Accepting the teachings of Jesus as a result of her study, she worked at the Victoria Women's Settlement in Liverpool for three years, then in Luffenham parish, and later was the first woman lecturer, in English literature, at the Oxford University Extension Delegacy. In 1908 she started her activities in the nonmilitant branch of the woman-suffrage movement, being on the executive council and editor of the *Common Cause* (1908-14). In this work, she became widely known as an eloquent and convincing speaker. She was assistant-preacher at the City Temple, London (1917-20), and in the latter year, she and Dr. Percy Dearmer founded the Fellowship Services, held in a hall, so that those opposed to seeking aid in a church might have the benefit of their help. Her publications include *Women and the Sovereign State* (1917); *The Hour and the Church* (1918); *The Moral Standings of the Rising Generation* (1922); *Blessed Joan of Arc* (1923); *Christ Triumphant* (1924); and *I Believe in God* (1927).

RUBBER. With the universal use of the motor vehicle with its pneumatic or solid rubber tires, the rubber industry has developed into one of the important manufacturing activities of the United States, which by 1928, so far as its product was concerned, exceeded the rubber manufacturing industries of all other countries in the world combined, and consumed nearly 70 per cent of the world's crude-rubber production in that year. With approximately 89 per cent of the world's motor vehicles made in the United States, it was inevitable that the United States should occupy a leading position in rubber manufacturing, and when to this is added the production of rubber footwear, as well as rubber hose and packing, it can be appreciated how important the American industry really is.

The world's production and consumption between 1910 and 1928 had increased roughly from 93,950 tons to about 658,000 tons in 1928. There was overproduction in 1919 following the World War, so that in 1920 and 1921 there was a decline in the output and in the latter year the lowest prices since 1913 were recorded. Low prices due to overproduction continued notwithstanding the increased consumption in the United States, and

it was realized that many of the plantations in the Far East were either operating at a loss or their future was seriously threatened.

In view of this situation, a plan devised by Sir James Stevenson and a committee, known by the name of its chairman as the Stevenson plan, was put into effect to restrict production on the Eastern plantations and increase, or at least stabilize, prices of crude rubber. This plan was pursued until Nov. 1, 1928, when it was abandoned. The Stevenson plan duly accepted by the British government came into effect Nov. 1, 1922. In 1923 British- and Dutch-owned plantations produced approximately 93½ per cent of the world's rubber, and of this somewhat more than 33 per cent was controlled by companies owned or managed in the Netherlands. Therefore, for the complete success of any restriction scheme, the cooperation of Dutch interests and plantations was essential.

The original plan developed in 1922 by the British Colonial Office and rubber producers, provided that 60 per cent of the estimated normal crop of rubber would be exported at the minimum duty, while exports in excess of that amount would be taxed heavily, the greater the excess, the heavier the tax. The normal output of each plantation was computed and each producer was allotted a certain amount over which he would be taxed. There was no restriction on production, and the producer could hoard his supply if he so desired. The growers in the Dutch East Indies were urged to cooperate and to work on the same basis as the British-owned plantations of Malaya and Ceylon, but they almost unanimously declined.

The first effect of the plan was an improvement in prices in which naturally the Dutch shared, and the members of the Rubber Growers' Association, the British controlling agency, believed that the plan would be effective without the cooperation of the Dutch East Indies. Naturally, there were disturbances in the rubber industry of both Europe and America, but these were calmed as prices soon declined. Those behind the scheme were doomed to disappointment, as American buyers cut down their purchases and prices fell below a point where it was believed they could be held by the Stevenson scheme. In the meantime, the Dutch East Indies benefited, as their production and exports increased, while those of Malaya and Ceylon were cut down in accordance with the restriction plan. Thus, the British Malayan exports in 1923 were about 184,000 tons, as compared with 212,695 tons in 1922; and those from Ceylon about 39,000 tons, as compared with 46,694 tons in 1922; but the Dutch shipped about 30,000 tons more in 1923 than in 1922, so that the Far Eastern supply was cut only about 9000 tons.

Obviously, such a small reduction had but little effect on prices, which fell during the year, and was not satisfactory to the advocates of restriction, who, still confident of its efficacy, continued to urge that the Dutch should join with them notwithstanding that they had made some \$70,000,000 more on rubber in the year ended Oct. 31, 1923, than in the year before. The British advocates tried to persuade the Dutch not to export more than 100,000 tons in 1924 and they argued that such a restriction would be good not only for the industry but would improve the plantations by preventing the trees from deteriorating under overtopping. The Dutch claimed that they had not overtapped their trees, and that the

^a Import figures in this table include with crude rubber, guayule, which is excluded in other import tables, but is included in this table in order to make a comparison with production figures which also include guayule.

^b Bureau of Labor Statistics, Department of Labor.

^c Commercial Research Department, United States Rubber Co., for 1910, thereafter, compiled from the *India Rubber World*.

^d Partly interpolated.

great increase in rubber output of the Dutch colonies was accounted for not so much by larger production from the estate plantations, possibly some 5000 tons over 1922, but by an extraordinary production of wild or native rubber, which was estimated at over 22,000 tons more than in 1922. The Dutch planters also claimed that the complete cessation of tapping for some such period as three months would be more advantageous than a policy of restricting.

While this restriction policy during its first years had failed so to stimulate the market price of rubber as to result in an increasing the exportable allowances, in 1925 it became possible for producers to increase production and this continued in 1926, although the regulations were changed somewhat at this time. In the meantime, the consumption of rubber had increased to a very marked degree and in the three-year period, 1925-27, the world consumption totaled 1,674,000 tons, the yearly amounts being 1925, 553,000 tons; 1926, 541,000 tons; and 1927, about 580,000 tons.

During these years, there was evident the constantly declining degree of control of the world's production of crude rubber exercised by British colonies and territories. In 1922, before restriction, British possessions produced 67 per cent of the world's rubber, but this declined to 53 per cent in 1925 under the policy of restriction. In 1926, when production was practically unrestricted, the British share amounted to 59 per cent, but in 1927 it was estimated at 53 per cent, while in 1928 the British territories supplied 61.6 per cent of the world's entire rubber production.

With the rubber decline in British possessions, there was corresponding increase of production in the Netherland East Indies, where Dutch native rubber had increased from 20,000 tons dry weight, produced in 1922, to about 93,000 tons in 1927. There was also an increase in the production of rubber in Indo-China and Siam, guayule rubber in Mexico, as well as of wild rubber in Brazil and Africa.

^d Includes 23,486,384 pounds of rubber, valued at \$10,918,104, from Mexico.

Source: Bureau of Foreign and Domestic Commerce.

World production of rubber as measured by net exports from producing countries increased from 426,000 long tons in 1924 to 528,000 tons in 1925, and to 623,000 tons in 1926. This increase, as stated, was the result of the higher rate of exports permitted in the area under restriction in 1925 and 1926, as well as of stimulation of production in nonrestricted areas caused by the high price of rubber during the period. This last factor operated to maintain production at 613,000 tons in 1927, despite a reduction in the exportable rate for the restriction area. World production in 1928 had increased to 658,000 tons, the gain being the direct result of the abandonment of restriction effective November 1 of that year.

Following the announcement of the British Colonial Secretary in this connection in the previous year, producers entered upon a full-produc-

rubber. The Ford Industrial Company of Brazil, a subsidiary of the Ford Motor Company of Detroit, acquired 3,700,000 acres in the Amazon Valley on which it proposed to undertake rubber cultivation on a large scale. The Firestone Company in 1926 arranged for a lease of 1,000,000 acres in Liberia, and continued to make further progress with its rubber-planting project. In Sumatra, the Goodyear interests increased their plantation holdings, so that American holdings in this island, including those of the U. S. Rubber Company and the Continental Rubber Company, together with the plantations of the Manhattan Rubber Company in Java, amounted to some 200,000 acres under development. In the Philippine Islands, progress has been made in furthering rubber cultivation and it has been proposed to amend the land laws so as to allow ownership of sufficient areas for the economic production of

tion programme as rapidly as possible, exporting excess production after November 1, and continuing into the following year. How long the production would continue to increase was a debatable subject, as considerable areas planted during 1925-28 would soon yield.

The American rubber industry, depending on raw materials shipped from foreign countries, where various schemes of restriction to control the production at times have been practiced, has manifested great interest in acquiring supplies of its own upon which it could depend for raw

rubber. In the Southwest, there has been development of guayule growing, while in Florida, Thomas A. Edison carried on experiments, with 3000 rubber and near-rubber plants, for which he claimed encouraging results.

As the accompanying table indicates, automobile tires and tire sundries are responsible for the larger part of the crude rubber consumption in the United States and notwithstanding their improvement and the greater numbers used have continued to mount and require an ever-increasing amount of crude rubber. The accom-

panying table indicates the production of automobile tires for certain years as recorded in censuses of manufactures.

The consumption of crude rubber in mechanical rubber goods (belting, hose, and packing) in factories reporting to the Rubber Association of America amounted to 40,083,000 pounds in 1928, which was 5 per cent less than the peak consumption of 1925. In the manufacture of mechanical rubber goods in the past few years, large quantities of reclaimed rubber also have been used. The value of boots and shoes reported in 1928 was only \$93,875,000, which was smaller than that for any of the previous five years. The value of heels and soles amounted to \$23,653,000; and the consumption of rubber in them was 12,524,000 pounds.

Manufacture of insulated wire and insulating compounds consumed 7,715,000 pounds of crude rubber in 1928, according to incomplete reports of the Rubber Association. Statistics for stationers' rubber goods and bathing apparel, included previously with druggists' rubber sundries, were shown separately in 1928. Production of the three classes together appears to have increased largely, 7,783,000 pounds of rubber being consumed, compared with 5,219,000 pounds in 1927. Lower prices brought a decline in value.

TABLE VI—USE OF CRUDE AND RECLAIMED RUBBER

Year	Long tons		Ratio of reclaimed to crude, per cent
	Crude rubber	Reclaimed rubber	
1925	387,629	137,000	35.3
1926	366,060	164,500	45.0
1927	373,000	189,500	50.8
1928	437,000	223,000	51.0

Reclaimed Rubber. An interesting development of recent years has been the increased use of reclaimed rubber, a material that, extensively employed in 1917 on account of war conditions,

by 1929 had become established as a compounding ingredient capable of employment in a wide variety of rubber products. By reason of regularity of supply, quality, and price, its content of many chemicals required in rubber manufacture, and the increasing skill of chemists in its application, reclaimed rubber had made for itself an important position and continued to increase in use, as the accompanying tabulation shows. Notwithstanding the low crude-rubber prices during 1928, the percentage of reclaimed used, as compared to 1927, was not reduced; during the last half of 1928, however, the percentage was notably less than in the first half. See MOTOR VEHICLES; PHYSICS.

RUBBER, ARTIFICIAL. See CHEMISTRY, APPLIED.

RUBIES, ARTIFICIAL. See MINERALOGY.

RUBIÓ Y LLUCH, ANTONIO (1856-). A Spanish scholar and man of letters. He took his doctor's degree in philosophy and letters at the University of Madrid (1879), and later became licentiate in civil and canon law. A professor of Spanish literature at the University of Barcelona, he has also specialized on the history of the Principality of Cataluña. His principal works are *Estudio crítico-bibliográfico sobre Anacreonte y la colección anacreontica, y su influencia en la literatura antigua y moderna* (1879); *Los navarros en Grecia y el Ducado Catalán de Atenas en la época de la invasión* (1886); *El renacimiento clásico en la literatura catalana* (1889); and *Documentos per l'història de la cultura catalana medieval* (2 vols., 1908 and 1921).

RUDDER, FLETTNER. See NAVIGATION.

RUEDEMANN, RUDOLF (1864-). An American geologist and palaeontologist (see VOL. XX). In 1926 Dr. Ruedemann, who had been assistant State palaeontologist of New York and curator of palaeontology of the N. Y. State Mu-

seum since 1899, became State palaeontologist. In 1928 he was elected to the National Academy of Sciences. His publications include *Lower Silurian Shales of Mohawk Valley* (1916); *Paleontologic Contributions* (1916); *The Existence and Configuration of Pre-Cambrian Continents* (1922); *Utica and Lorraine Formations of New York* (1925); and *Some Silurian (Ontarian) Faunas of New York* (1925).

RUFFO, 1867^{fo}, TITTA (1878—). An Italian dramatic baritone, born at Pisa. He studied under Persichini at the Accademia Santa Cecilia in Rome and then under Cassini in Milan. In 1898 he made his debut at the Teatro Costanzi in Rome, as the Herald in *Lohengrin*. It was not until the following year, in Rio de Janeiro, that he had the opportunity of appearing in principal parts; his unusual gifts both as a singer and actor were quickly recognized. After his return, he sang at the principal Italian opera houses and also won triumphs in Paris and Vienna. His American debut as Rigoletto with the Chicago Opera Association (Nov 4, 1912) caused a veritable sensation. He later revisited the United States several times, and always appeared with the same success, both in opera and in concert.

RUHR OCCUPATION. See GERMANY, under *History*; REPARATIONS.

RULE OF REASON. See LAW, PROGRESS OF THE

RUMANIA. An eastern European country, with an area of 122,282 square miles, as compared with 53,489 square miles before the World War. The cession of the following provinces accounted for the increase: Bessarabia (17,146 square miles), Bukovina (4030), Transylvania (22,312), Crisana (8038), Maramuresh (6258), Bánát (11,009). The population in 1914 numbered 7,768,341, in 1920 it was 16,262,177. Of the latter, 3,348,860 lived in urban communities and 12,913,317 in rural. An estimate in 1927 placed the population at 17,709,273, or 155 per square mile. Cities of over 50,000 in order were Bucharest, the capital (308,987 inhabitants in 1917), Chisinau, Czernowitz, Ismail, Jassy, Galatz, Temesvár, Braila.

Education; Religion; Race. Elementary education, though free and compulsory, is still in a rudimentary state. In 1927-28 the number of students enrolled in primary schools was 1,600,098, in other schools, 215,872, and in universities, 25,525. Besides the universities at Bucharest and Jassy, two additional were opened, at Cluj in Transylvania in 1919 and at Czernowitz in Bukovina in 1920. In 1918, 9,695,714 communicants belonged to the National Orthodox Church, 1,456,147 to the Greek Catholic, 1,483,929 to the Roman Catholic. Besides, there were 1,344,970 Protestants, 834,344 Jews, and 44,098 Mohammedans.

Though statistics on the subject are not available, a consideration of ethnographic surveys indicated that Rumania's problem of racial groups is one of great importance. There are large numbers of Magyars in Central Moldavia and East Transylvania, Saxons and Swabians in South Transylvania and the Bánát, Germans and Ruthenians in Bukovina and Bessarabia, Bulgarians and Serbs along the Danube, Bulgars, Russians, Germans, Turks, and Tartars in the Dobrudja and Russians in Bessarabia. By the Minorities Treaty signed with the Allies in 1919, Rumania pledged herself to respect all racial, linguistic, and religious differences and to permit the estab-

lishment of churches, schools, and eleemosynary institutions. These pledges were repeated in the new constitution of 1923.

Industry. Agriculture, as in old Rumania, is the main resource of the population of Greater Rumania. In 1926 there were 30,336,000 acres of arable land, or about 41 per cent of the total area; 10,270,000 acres of permanent meadow and pasture; 1,374,000 acres of trees, shrubs, and bushes; and 17,912,000 acres of woods and forests. The value of all crops in 1927 was \$410,712,000, compared with \$355,208,000 in 1926. In 1928 there were 4,552,166 cattle, 192,268 buffaloes, 3,075,782 swine, 12,941,000 sheep, 418,616 goats, and 1,939,438 horses.

CROPS AREA AND PRODUCTION

Crop	Area (thousands of acres)		Production (thousands of units—bushels, except as indicated)

^e Unit, gallon of wine

^f Unit, pound

Provisional figures for the 1928 acreage and production are wheat, 7,752,882 acres and 3,551,590 (metric) tons, rye, 703,137 acres and 300,579 tons, barley, 4,410,650 acres and 1,646,575 tons; oats, 2,711,020 acres and 932,768 tons; corn, 10,548,557 acres and 2,536,937 tons. The most important mining activity is that of petroleum. In 1913, 13,555,000 barrels were extracted; in 1928, 31,690,391 barrels. Refining is done in the country and most of the product is exported. Principal wells are located at Prahova, Dambovitza, Bacau, and Buzau. The wells and refineries were destroyed in 1916 to prevent their falling into the enemy's hands, but during the German occupation extensive restorations took place. Natural gas production, a new development, reached 13,305,000 cubic feet in 1926. Coal, salt, and other minerals are produced in small quantities, the production in 1926 being 2,731,362 tons of lignite, 344,062 tons of salt, 102,799 metric tons of non ore, and 62,979 tons of pig iron. In 1927 lignite production was 2,850,011 tons. Aside from petroleum refining, grain milling, and lumbering, manufactures are little developed. Plants are devoted to textiles, leather, iron, and ceramic products. In 1925, 3445 establishments employed 208,083 workers, as compared with 1149 and 58,871, respectively in 1915.

Trade and Communications. Rumanian exports were \$227,803,000 in 1927, as compared with \$176,590,000 in 1926; imports for the same years were \$201,975,000 and \$171,662,000. In 1928 imports totaled 32,145,101,000 lei and exports 26,919,256,000 lei. Exports of cereals in 1927 were the heaviest of any post-war year and exports of petroleum products reached a record in 1928. Exports in 1927 were greatly stimulated by reduction or elimination of export taxes on the principal commodities. On June 30, 1927, there were 31 steam and motor vessels (100 tons or over) belonging to the merchant marine, with a

total gross tonnage of 65,570 tons. The tonnage clearing from the Danube ports in 1927 was 9,818,800. In the same year, 2636 ships of 4,970,369 tons cleared the seaport of Constanza. The country's principal seaports are Constanza, Galatz, and Braila. In 1927 the total mileage of State railways was 8744. By the Treaty of Versailles, the Danube Commission was reconstituted to consist only of representatives of Great Britain, France, Italy, and Rumania.

Finance and Economic Conditions. For 1913-14 the budget balanced at 600,232,900 lei (\$115,844,950); the budget for 1929 provided for revenues and expenditures of 38,300,000,000 lei (\$231,711,000 at the rate of exchange then prevailing). Chief sources of revenue for 1929 were enumerated as direct taxes, 7,862,000,000 lei; indirect taxes and customs, 12,392,000,000; stamp taxes, 4,500,000,000; state monopolies, 8,253,000,000. The public debt on Oct. 1, 1913, amounted to \$341,455,000; in 1922, the total foreign debt, exclusive of the share in the obligations of the Austro-Hungarian monarchy, was \$1,025,000,000 at par of exchange then. Included in the latter were debts to the Allies and the United States aggregating \$396,000,000. The internal debt consisted of obligations given to the National Bank against paper money issues. On Jan. 1, 1928, the internal debt was 23,239,200,000 lei, of which 13,769,500,000 was the consolidated and 9,469,700,000 lei, the floating debt. The consolidated external debt amounted to \$66,060,560, 475,793,300 lire, 129,752,793 pounds sterling, and 499,099,500 French francs. In February, 1929, a further loan of £20,750,000 was floated and on February 8, the leu was stabilized at 813.588 to the pound sterling or a value of 10 milligrams gold. In 1929, 20,300,975,000 lei in paper currency was in circulation, as compared with 578,000,000 in 1914. The budget for 1924 was the first since the World War to contain a service for the internal and external funded debts. The failure to fund a large part of the debt, the inability of merchants to meet their foreign obligations incurred after the War, and the continued currency depreciation contributed to the commercial stagnation. In 1923 a temporary moratorium was declared. The exchange value of the leu for typical years was: 1914, \$0.193 (par); 1920, \$0.02; 1921, \$0.012; 1923, \$0.00494; 1927, \$0.00604. The cost of living index: 100, Aug. 1, 1916; January, 1922, 1858; January, 1923, 2494, December, 1923, 3552; July, 1927, 3900.

History. From the opening of the World War to Aug. 28, 1916, Rumanian politicians watched the straws to detect the direction of the wind. Refusing to be bound by the secret alliance with the Central Powers, they continually sought to drive a favorable bargain with the Allies, seeking promises of (Austrian) Bukovina, (Russian) Bessarabia, and (Hungarian) Transylvania and Banat. Teutonic successes in 1915 cooled the Rumanian ardor for a time, but the Allied victories in both the east and the west and the preparations at Saloniki in 1916 led to a secret agreement by which Rumania was to receive as the price of intervention, besides military support, a part of Bukovina, Transylvania, and the border regions to the west, and all the Banat. See BANAT OF TEMESVAR. On Aug. 28, 1916, therefore, Rumania confidently declared war on Austria, and Rumanian troops enthusiastically marched through the defiles of the Transylvanian Alps to liberate their kinsmen from Hungary.

Then, swiftly, disaster overtook the Rumanian cause. From the south, a Bulgarian Army swept into the Dobrudja to stay until the end of the War, while from the north, General Falkenhayn pursued the shattered Rumanian Army back across the frontier and into Moldavia. On Nov. 27, 1916, Bucharest was abandoned by the King and Parliament and Jassy was made the seat of government. Wallachia was overrun, large stores of grain sent to Germany, and the oil fields operated by the invader for his own purposes. Russian disintegration prevented a planned counter-offensive and Rumania was completely crushed. Some months later, she was compelled to accept an armistice dictated by Germany, and in March, 1918, to accede to the humiliating Treaty of Bucharest by which she was deprived of the Dobrudja and control over the Danube, as well as possession of her railways, wheat crops, and petroleum wells for an indefinite period. In the meantime, under the shadow of the German occupation, Parliament had passed a radical agrarian law fixing the maximum holding at 50 hectares and providing for a progressive annual distribution of large areas of land among the peasantry. By 1925, 5,713,600 hectares had been distributed.

With the fall of the Central Powers and the triumphal reentry of the King into Bucharest on Dec. 3, 1918, the militant Nationalists, flushed by a victory in which they considered themselves participants, assumed control of the government without waiting for a parliamentary mandate and took a threatening posture toward their late enemies. The annexation of Bessarabia was declared a *fait accompli*, an army was sent into Transylvania to support the movement for independence and union with Greater Rumania. To create a diversion in the face of internal unrest and perhaps also to impress the Peace Conference, Rumania in 1919 sent an army into Soviet Hungary. Early in August, the Rumanians entered Budapest and proceeded to confiscate foodstuffs, farm animals, tools, and rolling stock. Not until Admiral Horthy was safely installed as Regent of Hungary did they quit the country. By the treaties of St. Germain (Austria) and the Trianon (Hungary), the Bucharest "peace" (above) was canceled and Rumania was given sovereignty over most of Bukovina, all Transylvania, together with a strip of the Hungarian plain west of the Transylvanian uplands, and the northeastern half of the Banat of Temesvár. The Treaty of Neuilly (Bulgaria) confirmed Rumania in the possession of the Dobrudja. Moreover, by a treaty signed with the Allies in October, 1920, Rumania was authorized to retain Bessarabia. A minority treaty (Dec. 9, 1919) dictated by the Allies guaranteed liberal treatment of minorities in the annexed as well as the pre-war territories of Rumania. The combined result of the peace treaties was to more than double Rumania's area and population.

The years following were concerned with the vexing internal problems of constitutional reform, the agrarian question, and the general unrest brought on by tardy reconstruction measures. Ministries fell rapidly. In 1919-20 an agrarian minorities bloc tried to form a government, but it soon gave way to the ministry of General Averescu, supported by Take Jonescu, which was strongly nationalistic in temper. The minorities in Bukovina, Transylvania, and Bessarabia, were antagonized by the dissolution of their national councils; the failure to hasten the land reform

measures aroused the hostility of the peasants. Meanwhile, the prisons were being filled with political prisoners. In 1921 Jonescu headed a ministry; in 1922 Jon Bratiano succeeded him. On Oct. 15, 1922, the coronation of King Ferdinand and Queen Marie as rulers of Greater Rumania was celebrated. The year marked an increasing participation of Rumania in foreign affairs. The Rumanian government renewed its adhesion to the Little Entente (q.v.), which it had formed together with Czechoslovakia and Yugoslavia in 1920, and by its firmness it forced the Russians temporarily to accede to the annexation of Bessarabia. The goings and comings of Queen Marie over Europe, and her success in marrying her daughters to the kings of Greece and of Yugoslavia, gave Rumania a certain conspicuousness perhaps hardly justified by its internal condition or its potential development. The year 1923 saw no further advance toward stability. Anti-Semitism was rife and led to frequent attacks on the Jews and on the Government for being presumably sympathetic toward Jewish aspirations. Fascism, inspired by Italian success, appeared and 100,000 Black Shirts were soon enrolled. Even the promulgation of the National Constitution (Mar. 28, 1923), which in some senses was an advanced document, did not serve to quiet the unrest. By it, minority representation was provided and full rights of citizenship were granted to Rumanian Jews; the State claimed for itself all mineral wealth, including oil, to be found in the subsoil, as well as water-power properties, etc.; constitutional guarantees were set up for the freedom of the press and against the imposition of a censorship, for the freedom of association, public assembly, etc. The failure to satisfy the peasants by a land division, the repeal of the more liberal declarations of Bessarabia and Transylvania of 1918 which established land and electoral reforms, and the recognition of the Greek Orthodox Church as the dominant ecclesiastical body, arousing resentment in the Roman Catholic Magyars, resulted in the strengthening of an opposition whose character presaged future difficulties.

The year 1924 hardly saw an alleviation of Rumania's difficult position. Threatened by Russia on one side, rebuffed by the Great Powers, with the possibility of internal dissension hanging over the country, the Government's deportment plainly showed its uneasy frame of mind. Russia abruptly terminated the Russo-Rumanian conference at Vienna in March because of the Bessarabian question. There was continual talk of Russian desire to establish a Moldavian republic centring in Bessarabia and including Kherson and Podolia. Whether Russia meant to attack or not, the Rumanian official attitude certainly favored preparedness, for a steady stream of munitions was proceeding from France into the country. In April and May, the Rumanian royal family completed a round of visits to Paris, Brussels, and London; but the financial and diplomatic purposes behind the visits ended in failure: Rumania received neither promises of military aid nor the proffer of funds to relieve her economic distress. Foreign governments were further antagonized by the mining law of July, 1924, the terms of which were very unfavorable to foreign-owned corporations. To complicate further the domestic situation, protests were frequent against the virtual dictatorship of the Bratiano brothers. From the economic and political points of view gen-

erally, Roumania's situation was quite as critical as that of her neighbors, Bulgaria, Greece, and Hungary.

As time went on, the opposition to the Bratiano régime became more and more pronounced. Among the people, it found expression in occasional huge mass meetings, such as that at Bucharest in June, 1924, and in Parliament in the frequent refusal of the opposition parties to participate in legislation. Recognizing that their division played into the hands of the Bratianos and the Liberals, the opposition made many attempts to unite their forces. Early in 1925, the fusion movement attained partial success when the National Party joined hands with the Peasant Party; their common hostility to the existing ministry was voiced at a big demonstration in Bucharest on May 17 attended by some 150,000 people. To prevent this movement from flaming out into revolution, the Government held the country under martial-law conditions. It yielded to the popular unrest sufficiently to pass a law providing for practically universal suffrage, but otherwise made few concessions. Nevertheless, its position grew weaker. Financial depression, the Bratiano policy of utilizing the state's resources for party advantage, the depressing effect on the country's economics of the Government's hostile attitude toward foreign capital, were all undermining influences. They were to some extent offset by the able handling of the country's finances, signalized by the balancing of the budget and the consolidation of the foreign debts, including that to the United States.

An assertive foreign policy, while it appealed to Rumanian nationalistic spirit, created much ill-feeling and tended to isolate the nation. Three disputes particularly stood out. The tension with Russia over Bessarabia continued but tended to decrease. The Soviet leaders realized that the Besarabians were not eager to exchange the Maniu régime for the Communist rule. With Germany there was some disagreement over the redemption of notes issued in Rumania during the war-time occupation which brought on an economic war, but this was settled in 1928, prior to the consummation of the stabilization loan. The controversy with Hungary over the expropriation of lands of Hungarian owners in Transylvania during the agrarian reform movement in 1929 was before the League of Nations.

At the close of 1925, Prince Carol formally renounced the throne, and his young son Michael was declared the heir-apparent. A regency council consisting of Prince Nichols, the Patriarch of Rumania, Miron Cristea, and the President of the Supreme Court of Appeal was appointed to act in case of the death of King Ferdinand before the 4-year-old boy became of age. When the local elections in February, 1926, went against them, the Bratiano brothers felt that a temporary retirement would be advisable and the cabinet resigned, March 27, after the Government had forced through a new electoral law which provided for control of Parliament by a party polling two-thirds of the total vote if the rest of the vote was divided among minor parties.

Instead of turning to the leader of one of the strong opposition parties in Parliament, the King asked General Averescu, generally recognized as Bratiano's understudy, to form a cabinet. In the ensuing elections in May, the ministry had little trouble in registering an overwhelming victory. The new ministry, under strong Liberal influence,

continued in the main the Bratiano policies. In domestic affairs, however, it became evident that without a foreign loan the country was heading toward bankruptcy, and in foreign relations it initiated a rapprochement with Italy, whose government General Averescu was known to admire greatly. He presently arranged with Mussolini for a funding of the Rumanian debt to Italy and for a loan of 200,000,000 lire for stabilizing the leu. On Sept. 16, 1926, the two countries signed a treaty of friendship and arbitration at Rome. The pact was sharply criticized in Rumania because it did not include a ratification by Italy of the treaty of 1920 recognizing Bessarabia as a part of Rumania, which Great Britain, France, Italy, and Japan had signed, but which only the first two had ratified. Italy and Japan had refrained from taking action apparently through a desire to avoid antagonizing Russia, which had never ceased to dispute the ownership of the province with Rumania. However, on Mar. 8, 1927, Mussolini finally ratified the treaty, a step of much diplomatic significance and one which added considerably to the prestige of the Averescu government. Another important agreement was a treaty signed with France in June, 1926 (although the terms were not made public until the following January). It was a treaty of nonaggression and was considered as having the strength of an alliance. The recognition by France of the territorial *status quo* once more proclaimed that country's support of Rumania's claim to Bessarabia and brought a vigorous note of protest from Russia. Other international agreements included a renewal of the Little Entente understanding.

Despite these diplomatic triumphs, the position of the Averescu ministry remained highly precarious. Queen Marie made a tour of the United States in November, 1926. The rapidly failing health of King Ferdinand brought questions of the succession to the fore and added to the feeling of unrest. Drawing away from the Liberals who constituted his chief support, General Averescu tried to come to an understanding with the Tsarists. When the effort failed, he resigned, June 4, 1927. Baron Stirbey formed a coalition cabinet but was soon succeeded by his brother-in-law, Jon Bratiano, who, by methods which had become almost traditional in Rumania, dominated the succeeding elections and obtained some 70 per cent of the total vote. On July 20, King Ferdinand died. The expected uprising did not occur, and the succession passed quietly to his grandson, Prince Michael.

Consolidated around the National Tsarist Party, the opposition was now assuming such strength that its demands for political and economic reforms could no longer be ignored. It was supported also by the strong anti-Liberal attitude of Hungary, whose grievances continued to be the source of constant ill-feeling. On November 24, the political scene was suddenly altered by the death of Jon Bratiano, so long the strong man of the conservative elements. There was no immediate political overturn, however, his brother, Vintila Bratiano, taking over the leadership of the country and the Liberal Party; but the country was quite evidently weary of the whole Bratiano régime and its subversive methods. Late in March, 1928, a great march of 60,000 peasants on the capital gave expression to the popular dissatisfaction, and this was followed, early in May by a monster mass meeting of some 200,000 peasants at Alba Julia in Transylvania, where resolutions of strong opposition to the ministry

were passed; but the regency council and the cabinet stood firm, and the demonstration produced no immediate change.

During the greater part of 1928, the Government sought to strengthen itself by negotiating a foreign loan, but was quite unsuccessful, partly, no doubt, because M. Maniu served notice on foreign capitals that no loan contracted by the Bratiano government would be recognized as valid when the Opposition should come into power. The problem was the pressing necessity for foreign financing of a large loan and the obvious reluctance of the foreign financiers to grant a loan to a government opposed by the majority of the population. The pressure finally became so great that the Council of Regency could no longer stand out against it. On request of the council, Premier Bratiano reluctantly resigned, on Nov. 4, 1928. Five days later, M. Maniu formed a government and immediately called new elections. These were held on December 12. Characterized as the first fair and free elections the country had known for many years, they resulted in an overwhelming victory for the Nationalist Peasant Party, which obtained 333 seats and with the adherence of small allied parties could count on some 355 votes in the Lower House out of a total of 387.

The significance of this change of government was in effect almost revolutionary. It brought into power a régime committed to a programme of liberalism all the way along the line, including free elections, decentralization of government with full local autonomy, removal of all censorship, a receptive attitude toward foreign capital, full recognition of the right of minorities, a pacific foreign policy with strong support of the League of Nations, effective encouragement of agriculture, a sound and just tariff policy, and in general the establishment of a free Western democracy. The new government entered on its programme by abolishing martial law and the censorship and reducing the gendarmerie. Negotiations for a foreign loan which had been pending for a year were continued, and on Feb. 11, 1929, resulted in the signing of contracts in Paris for a loan of \$100,000,000 to be floated on the money markets of Europe and the United States. It was to be applied to the stabilization of the leu, reorganization of the Bank of Rumania on a sound basis, and the rehabilitation of the railroads. Shortly thereafter, the loan was reported to be largely oversubscribed. The policies of the Maniu government were received with great favor by the Rumanian people, who felt that a new day was dawning for them.

In March, 1929, a law was passed giving foreign companies equal rights with Rumanian in the making of oil leases. Their attitude was evidenced in the happy temper of an immense celebration of the tenth anniversary of the birth of the new and greater Rumania, held at Alba Julia on May 19-20. It drew some 200,000 peasants from all parts of the country, whose spirit of satisfaction contrasted strongly with the tone of indignant protest which had marked the assemblage at the same place a year before. Besides the Mining Law, with the complete elimination of all restrictions against foreign capital, a number of other constructive laws were passed by Parliament in its first regular session under the new régime, ending in August. These included the Customs tariff; the establishment of free zones at certain ports; the "lien law"—all favorably affecting foreign trade. See Bessarabia; TRANSYLVANIA; WORLD WAR, DIPLOMACY OF.

ROMANIAN LITERATURE. Rumanian letters have reached a stage of maturity which bring them much nearer to the Western European standards, just as today, geographically, the country borders almost on the centre of the Old Continent.

In poetry, that magician of the word, Tudor Arghezi (born in 1880), has brought a new and rich ferment. Worthy of being mentioned among his contemporaries are Octavian Goga (born in 1881), a master in the art of Rumanian verse; Ion Minulescu (born in 1881), builder of sonorities and symbols; Ion Pillat (born in 1891), many-hued and of the grand old manner; Ion Barbu (born in 1895), very modern; Camil Baltazar (born in 1902), suave and intricate; A. Toma, of the sculptured verse, Ovid Densusianu (born in 1873), discreet and temperamentally aloof; Perpessicius, dignified and noble; Al. T. Stamatiad (born in 1885), of the golden Hughes; N. Davidescu (born in 1888), aristocratic, in search for the unusual; G. V. Bacovia (born in 1881), strange and elusive; M. Codreanu (born in 1876), the perfect sonneteer; G. Topârceanu, sentimental, tinged with humor; Emic Furtună, warm and profound, continues the tradition of Mihail Eminescu (1850-1889) and P. Cernia (1881-1913); Barbu Lazăreanu, of the quaint note of the popular, sweet and melancholy, Aron Cotrus (born in 1891), restless, of the soil, Nichifor Crănic (born in 1889), of the traditional line, F. Aderca (born in 1891), struggling with rebellious forms; Corneliu Moldovanu (born in 1883), classic; G. Murnu (born in 1868), translator of Homer, O. Carp (born in 1867); Cincinnati Pavelescu (born in 1872), the troubadour, D. Karnabatt, of grandiose rhythm; Radu D. Rosetti (born in 1874), still young, A. Măndru, Victor Eftimiu (born in 1886), manifold, George Gregorian (born in 1886); Vasile Militaru, idyllic; Leon Feraru (born in 1887), author of *Old Shanty* and other poems; Donar Munteanu, D. Nanu (born in 1873); V. Demetrius (born in 1878); Ion Vineu, of the more advanced school; Ion M. Raşcu (born in 1890); Lucian Blaga (born in 1895), modernistic; Emil Isac (born in 1889), dashing, Demostene Botez (born in 1893), wondering at life and death; Pan Halippa, of Bessarabian source; Mircea Rădulescu; Eugen Relgis, humanitarian, A. Domiuc (born in 1889), impressive, Virgiliu Moscovici; B. Fundoianu; Adrian Vereu; Artur Enăşescu (born in 1888); Ion Foti (born in 1887); Horia Furtună (born in 1888); Alice Călugăru; Elena Farago (born in 1878); Natalia Negru; Claudia Millian; Otilia Cazimir, the most quoted; Mihail Celarianu (born in 1893); Emanoil Bucuţa; Ion Al-George; Mateiu Ion Caragiale (born in 1885); Mihail Cruceanu (born in 1887); Eugeniu Sperantia (born in 1888); Camil Petrescu; Alfred Moşoiu; George Voievica, Adrian Maniu; Dragoş Protopopescu; I. U. Soricu (born in 1882); Şerban Bascovici; Ion Buzdugan; Marcel Romanescu; Al. A. Philipide; Ion Marin Sadoveanu; V. Russu-Şirianu; Eugen Ştefanescu-Est; G. Talaz; Tudor Vianu; V. Voiculescu; George Silviu; and Ştefan I. Nenişescu.

The sway of Dimitrie Anghel (1872-1914) left a deep imprint in the poetry of the later years. His verse is characterized by the graceful blending of the native popular and the European.

In the short story and novel, the leader is still Mihail Sadoveanu (born in 1880) in whose work

Moldavia, his native province, appears in all her glory. Gala Galaction (born in 1879) excels in sincerity and his prose glitters like the jeweled ikons in the semi-obscurity of an old monastery. V. Demetrius, the poet, is also a novelist of distinction. Liviu Rebreanu (born in 1885) began his successful career as a novelist with *Ion*. Rebreanu watches his characters and lets them act according to their impulses. *The Forest of the Hanged* shows marked progress in his craft. His latest, *Cruleandra* (a folk dance), is a step forward in this particular field of Rumanian literature. Ion Agârbiceanu (born in 1882) gives interesting studies of fiction characters. Jean Bart (Eugeniu Botez, born in 1874) publishes under his pen-name powerful short stories and sea sketches. D. D. Patraşcanu (born in 1872) has wit and a fertile imagination.

Al. O. Teodorescu and his brother, Ionel Teodorescu, have conquered Rumanian audiences lately. Al. is full of the Rabelais and Anatole France kind of humor, Ionel is more solemn and epic. One discusses Ionel's heroes as though they were living creatures. The secret is the new master's great talent. The venerable Ion Brătescu-Vornăşti (born in 1867) has added to humanity a world of modest men and women, characters softening the hearts of generations of readers. Lately, Cezar Petrescu has emerged as a novelist of note. Others are Al. Cazaban, Vasile Pop, Caton Theodorian, Ion Ciocărlan, D. Teodorescu, Lucia Mantu, Henriette Yvonne Stahl, Hortensia Papadat-Bengescu, Vasile Savel, Constanţa Marino-Moscu, Damian Stănoiu, I. Peltz, A. L. Zissu, I. Ludo, Ion C. Vissarion, Sarina Casvan-Pas, N. Batzarria, and Marcu Beza, both distinguished and versatile writers. Ion Pas shows fine qualities in his sketches and novels of factory life. The poets, Ion Minulescu, N. Davidescu, Eugen Relgis, F. Aderca, Corneliu Moldovanu, Emanoil Bucuţa, have tried their hands at creating the novel, sometimes successfully. N. Pora possesses the gift of suggestion and his short stories have charm. C. Ardeleanu receives much praise for his recent works. Constantin Kirişescu attracts with his lovely world of apostles. The list of new authors is not exhausted here.

A. Davila, Victor Eftimiu, A. de Herz, Mihail Sorbul, B. Luca, Dr. A. Stern, the translator of Shakespeare, Octavian Goga, N. Iorga, G. Ciprian, and others, contribute to the theatre.

In criticism, we find N. Iorga, a scholar of eminence, Ovid Densusianu, Sextil Puşcariu, Mihail Dragomirescu, C. Stere, G. Ibrăileanu, G. Bogdan-Duică, G. Adamescu, Eugen Lovinescu, Paul Zarifopol, Tudor Tedorescu-Brianşte, M. Ralea, H. Sanielevici, Aureliu Weiss, Şerban Cioculescu, I. Shuchianu, M. Sevastos, Lotar Rădăceanu, and others.

Political writers of fine calibre are Dr. Nicholas Lupu, the leader of the Peasant Party, Constantin Graur, Eugen Filotti, Emil D. Fagure, H. St. Streitman, M. Schwarzfeld, B. Brănişteanu, Iosif Nădejde, Pamfil Şeicaru, S. Grosman, Em. Socar, Horia Carp, M. Sărăţeanu, and M. Schweig.

Mention must be made of the few master minds, such as Professors C. Rădulescu-Motru, S. Mehedinţi, I. Petrovici, who, together with the writers referred to above, are forging the culture of contemporary Rumania.

RUMBOLD, rûm'bôld, Rt. Hon. SIR HORACE GEORGE MONTAGU (1869-). A British dip-

lomat. In 1890 he became British Attaché at The Hague, and was appointed to Cairo in the next year. After serving at Vienna, Madrid, Tokyo, etc., he was chargé d'affaires at Berlin, July 1-27, 1914. On the declaration of war, he returned to the Foreign Office in London. He was British Minister to Switzerland (1916-19), to the Republic of Poland (1919-20), and High Commissioner and Ambassador at Constantinople (1920-24). He attended the Lausanne Conference (1922-23), as head of the British delegation in 1923, and as deputy for Lord Curzon, signed the Treaty of Lausanne (July 24, 1923). In 1924 he became Ambassador to Spain and in 1928 was appointed Ambassador to Germany. He was made a member of the Privy Council in 1920.

RUPPRECHT, CROWN PRINCE OF BAVARIA (1869-). (See VOL. XX). He commanded the 6th Army of Bavarian troops which won the battles in Lorraine in August, 1914, and later was in charge of the German front at Artois and southern Flanders. In 1916 he was made field marshal and given the chief command of the northern group of armies on the western front. He renounced his claim to the Bavarian throne at the time of his father's abdication in 1918, and was said to have privately stated his disapproval of the German foreign and military policy in the World War. He published *Mein Kriegstagebuch* (1929).

RURAL CREDIT. See AGRICULTURAL CREDIT.

RUSBY, HENRY HURD (1855-). An American botanist and physician (see VOL. XX). In 1917 Professor Rusby led an exploring party to the mountains of Colombia, in a search for sources of quinine. In 1921-22 he made a trip to Bolivia and Brazil, partly in the interest of identification of the so-called "courage plant."

RUSIÑOL Y PRATS, SANTIAGO (1861-). A Spanish author and artist, who studied sculpture and painting in Paris under Clarassó, Canudas, Utrillo, and Zuloaga. His paintings and particularly his garden scenes won awards in Paris, Chicago, Barcelona, Rome, and Venice. Commencing his literary work in 1890 with a monologue, *L'home de orga*, he published the plays *L'aligría que passa* (1898, staged in 1901); *I Llibertat! La mare; La bona gent; El místic*. Also the prose works *Anant el mon* (1896); *Oracions* (1897); *Fulls de la vida* (1898); and *El poble gris*. His works were written in Catalan and translated into Spanish, French, and other languages.

RUSSELL, BERTRAND (ARTHUR WILLIAM) (1872-). A British philosopher (see VOL. XX). During the World War, he was a pacifist and was imprisoned for six months for attacking the reputation of the American Army. He was also forced out of his chair at Cambridge University. He identified himself more and more with the radical movements, and when a delegation from the British Labor Party sailed to investigate conditions in Soviet Russia, he accompanied them. He came away disillusioned with communism and wrote of his dissatisfaction in *The Practice and Theory of Bolshevism* (1920). Sailing for China in 1920, Russell found amid the ruins of the Celestial Empire a greater promise of freedom than that of the Occident. In China, he composed a work on *The Analysis of Mind* (1921), in which he accepted the principal tenets of behavioristic psychology. In 1924 he visited the United States

as a professional lecturer. He predicted the gradual enslavement of impoverished Europe to the mechanical civilization of America. In addition to the works mentioned, Russell published: *Principles of Social Reconstruction* (1917); *Mysticism and Logic* (1918); *Roads to Freedom* (1918); *Introduction to Mathematical Philosophy* (1919); *The Problem of China* (1922); *The A B C of Atoms* (1923); *The Prospects of Industrial Civilization*, with Dora Russell (1923); *Icarus, or the Future of Science* (1924); *What I Believe* (1925); *How to be Free and Happy* (1925); *The A B C of Relativity* (1925); *On Education* (1926); *An Outline of Philosophy* (1927); *The Analysis of Matter* (1927), and *Sceptical Essays* (1928). In 1929 appeared a new edition of *Our Knowledge of the External World*.

RUSSELL, SIR (EDWARD) JOHN (1872-). An English botanist and chemist, born at Frampton, Gloucestershire, and educated at the University College of Wales and Victoria University of Manchester. He was lecturer and demonstrator in chemistry at the latter institution (1898-1901), head of the chemical department at the Agricultural College, Wye (1901-07), and soil chemist at the Rothamsted Experimental Station, Harpenden (1907-12), of which he later became director. During the World War, he was technical adviser to the Food Production Department and a member of the National Salvage Council. He wrote *Farm Soil and Its Improvement* (1923); *Plant Nutrition and Crop Production* (1926), and other works on the subject of soil chemistry.

RUSSELL, GEORGE WILLIAM ("E") (1867-). An Irish writer and painter (see VOL. XX). He was a member of the Irish Convention (1917-18), and editor of *The Irish Statesman* (since 1923). In 1928 he lectured in the United States. His later works include *Gods of War* (1915); *The National Being, some Thought on an Irish Policy* (1917); *The Candle of Vision* (1919); *The Interpreters* (1922); *Voices of the Stones* (1925); and *Midsummer Eve* (1928).

RUSSELL, HENRY NORRIS (1877-). An American astronomer, born at Oyster Bay, N. Y., and educated at Princeton University. He was a Carnegie research assistant at the Cambridge Observatory in England in 1903-05. In 1905 he became an assistant in astronomy at Princeton; in 1911, professor; and in 1912, director of the Observatory there. The stars were the subject of his researches. He published papers on stellar parallax, stellar evolution, and stellar statistics, as well as on binary stars and eclipsing variables. He was an engineer in the Air Service of the United States Army in 1918, as well as a member of the National Research Council. Professor Russell became a Fellow of the Royal Astronomical Society, whose gold medal he won in 1921. In the same year, he became a research associate of Mt. Wilson Observatory. In 1922 he was awarded the Draper Medal of the National Academy of Sciences (American) and the Lalande Medal of the French Academy; in 1925 he won the Bruce Medal of the Astronomical Society of the Pacific and the Rumford Medal of the American Academy of Arts and Sciences. He is the author of *Determinations of Stellar Parallax* (1911); *Astromomy* (1926); *Fate and Freedom* (1927).

RUSSELL, WILLIAM FLETCHER (1890-). An American university professor, born at Delhi, N. Y., and educated at Cornell University. After

teaching for several years in Greeley, Colo., he became assistant professor in history and sociology at the State Teachers' College, and after studying at Columbia University and serving as assistant in the philosophy of education there, he was appointed associate professor of secondary education at the George Peabody College for Teachers in Nashville, Tenn. From 1916 to 1917, he was professor of that subject. In 1917-23 he was dean of the College of Education at the State University of Iowa. Since 1923 he has been professor of education at Teachers College, Columbia University (dean since 1927). Professor Russell wrote *The Early Teaching of History in New York and Massachusetts* (1915); *Economy in Secondary Education* (1916); *Education in the United States* (1917); *Schools in Siberia* (1919); *School Finance in Iowa Cities* (1921); *Schools in Bulgaria* (1923).

RUSSELL SAGE FOUNDATION. An organization incorporated in 1907 for the improvement of social and living conditions in the United States. Its work, which gives large place to research and publication, is carried on by a staff of men and women trained in special lines of investigation and social welfare. The direct activities of the Foundation are carried on through the following departments. Charity Organization; Industrial Studies; Publications and Library; Recreation; Remedial Loans; Statistics; and Surveys and Exhibits; there is also a consultation service on problems of delinquency and penology.

From 1920 until 1929, the Charity Organization Department conducted a study of marriage laws and their administration, making investigations in 96 cities of 36 States. The Foundation published *Child Marriage*, by Mary E. Richmond and Fred S. Hall in 1925, and Miss Richmond's *What is Social Case Work?* was translated into Dutch in 1926, and into French in 1927. The department was particularly interested in youthful marriages, and partly as a result of its propaganda, laws tending to prevent child marriage were passed in several States, including Pennsylvania, New York, Minnesota, and Connecticut. The study was completed with the publication, early in 1929, of *Marriage by the State*, by Mary E. Richmond, and Fred S. Hall, and *Marriage Laws and Decisions—A Digest*, by Geoffrey May.

The Department of Industrial Studies continued to investigate, among other problems, instances of wage earners' participation in management. The Department of Recreation worked in conjunction with the Committee on the Regional Plan of New York and its Environs, completing in 1928 reports on recreation facilities and needs within New York, and on "The Neighborhood Unit," which were published in the committee's report. The uniform small-loan law, prepared by the Foundation's Department of Remedial Loans, for the protection of small borrowers, was in force in 25 States by 1929, and the department remained active in advocating the passage of the law in other States, and in encouraging credit unions.

Until 1926 the Department of Social Legislation worked for child welfare, cooperating chiefly with the Commission on Public Welfare Legislation of the District of Columbia. The activities of the consultation service on delinquency and penology resulted, in 1928, in the passage of a bill creating a committee of the House of Representatives to investigate prison labor, and the condition of Federal prisoners in county jails. In

addition to reviewing all statistics published by the foundation, the Department of Statistics studies various social problems, preparing such compilations as *Employment Statistics for the United States*, 1927. As part of its work of presenting information about social conditions to the public, the Department of Surveys and Exhibits completed, in 1926, a report for the Welfare Council of New York City, listing 527 records of social studies made between 1915 and 1925. The Foundation library contained, by 1929, 27,906 bound volumes, and 96,061 pamphlets and unbound reports, and it regularly receives about 250 periodicals. The Foundation publishes, in addition to the books prepared by the special departments, bi-monthly bibliographies on various social and welfare subjects.

RUSSIA. A federal republic comprising the greater part of the former Russian Empire and officially entitled the Union of Socialist Soviet Republics, more familiarly known as Soviet Russia. It stretches over a vast expanse of territory in eastern Europe and northern Asia. Capital, Moscow.

Political Divisions. The Union of Socialist Soviet Republics consists of six Socialist Federated Soviet Republics, which are further subdivided into autonomous republics and autonomous provinces. The principal federations are (1) the Russian Socialist Federated Soviet Republic, (capital, Moscow), embracing the principal Great Russian "governments" or states of Russia in Europe and western Siberia, (2) the Ukrainian Socialist Federated Soviet Republic (capital, Kharkov); (3) the White Russian Socialist Soviet Republic (Minsk); (4) the Federation of Transcaucasian Soviet Republics (Tiflis); (5) Turcoman Socialist Soviet Republic (Leninsk); and (6) the Uzbek Socialist Soviet Republic (Samarkand). The Republic of Khoresma (Khiva) is affiliated with the Union but not a member of it. The Russian Socialist Federated Soviet Republic is composed of the following autonomous republics: (administrative centres in parentheses): Crimean (Simferopol), Bashkir (Ufa), Tartar (Kazan), Kirghiz (Orenburg), Turkestan (Tashkent), Daghestan (Makhach-Kala), Mountain (Vladikavkaz), Yakutsk (Yakutsk), Carelia (Petrozavodsk), Buriat-Mongolian (Irkutsk); the following autonomous territories: Chuvash (Cheboksary), Kalmyk (Astrakhan), Mariak (Krasnokokshaisk), Votyak (Izhevsk), Kabardin-Balkar (Nalchik), Zyriany (Ust-Sysolsk), Karachae-Cherkass (Batalpashtchinsk), Oiratski (Oolala), Adigheisk-Circassian (Krasnodar); and Volga German's Territory (Pokrovsk); and Chechen Territory (Grozny).

The Transcaucasian Federation consists of three principal republics, namely Azerbaijan (principal town, Baku); Armenia (Erivan); and Georgia (Tiflis). Tiflis is the capital of the federation. Besides these, there are incorporated in the federation also the minor republics of Abkhaz (principal town, Sukhum) and Adjar (Batumi). By the Treaty of Brest-Litovsk (Mar. 3, 1918), the Ukrainian Republic was detached from Russia and placed under German control but subsequently became reunited with Soviet Russia. (See UKRAINE.) The provinces of Volhynia, Vilna, Kovno, and Grodno were separated from Russia and became part of Poland, while the provinces of Erivan and Kars passed to Turkey. The border provinces of Latvia, Estonia, and Lithuania became established as in-

dependent states, and so did the Grand Duchy of Finland, while the Province of Bessarabia was annexed to Rumania. These are discussed elsewhere under separate titles.

Area and Population. The area of the Soviet Union is 8,240,483 square miles and the population, according to the 1926 census, was 147,013,600, of which 71,024,300 were males and 75,989,300 were females. The density was 17.8 per square mile. The land area within the old boundaries of Russia was 8,417,118 square miles and the population in 1897 was 129,209,000 and in 1914 (estimated) 178,379,000. The area and population of constituent socialistic soviet republics in 1926 are shown in the following table (S.F.S.R. represents Socialist Federated Soviet Republic):

	Area square miles	Population
Total, U. S. S. R.	8,240,483	146,989,460
Russian S. F. S. R.	7,624,817	100,858,000
White Russian S. S. R.	48,954	4,983,900
Ukrainian S. S. R.	174,413	29,020,300
Trans-Caucasian S. F. S. R.	71,232	5,850,700
Turcoman S. S. R.	189,658	1,030,500
Uzbek S. S. R.	131,408	5,270,200

The population is 82 per cent rural and 18 per cent urban. It is composed of 182 different nationalities, speaking 149 different languages and dialects. The death rate of the country was 20.9 per thousand in 1926, as compared with 28.3 in 1913.

The census showed a strong trend of population to the cities, in line with the industrialization of the last few years. Since the urban census of 1923, Moscow and Leningrad each has increased its population by over 500,000. Other large cities gained an average of 30 per cent in the three years between 1923 and 1926. Population of the principal cities, census of 1926-27: Moscow, 2,025,947; Leningrad, 1,614,008; Kiev, 513,789; Baku, 452,808; Odessa, 420,888; Kharkov, 417,186; Rostov-on-Don, 308,284; Tashkent, 323,613; and Tiflis, 292,973. The population as of Jan. 1, 1928, was estimated by the Central Statistical Board at 149,900,000.

Government. The form of government of the Union of Socialist Soviet Republics (U.S.S.R.) may be described as an oligarchy in the guise of a federated republic. According to the new Soviet constitution drafted in July, 1923, and ratified in February, 1924, sovereign power is vested in the supreme organs of the federation, i.e., the Union Congress of Soviets, the Central Executive Committee of that Congress, and its Presidium. The Congress of Soviets, of about 2000 members, is elected by the various congresses of the federated republics and meets for a week once a year. The Central Executive Committee is composed of two Houses, known respectively as the Federal Council and the Council of Nationalities, the former consisting of 371 members elected by the Federal Congress of Soviets according to population, and the latter of some 98 members, five elected by each federated member state and one by each of the autonomous republics or districts. Each of these two Houses elects its own Presidium, or standing committee, of seven members. Between sessions of the Federal Congress of Soviets, the Central Executive Committee is the supreme organ. It meets three times a year and is replaced during recesses by the Presidium of 21. The Central Executive Committee jointly elects Federal commissars (or

ministers) on the following basis: (A) five Federal commissariats, all regional, representatives of which in the participating states are appointed by, and responsible to, the Union commissars, viz.: (1) foreign affairs; (2) army and navy; (3) foreign trade; (4) transport; (5) post and telegraphs; (B) five "combined" commissariats, each of which has parallel commissariats in the various participating states, chosen by the latter but approved by the Federal commissars, whose authority is shared by them, viz.: (1) supreme council of national economy; (2) food; (3) labor; (4) finance; and (5) workers' and peasants' inspection. The 10 commissars at the head of these commissariats, together with a president and vice president, form the Union Council of People's Commissars. This body has legislative and executive powers subject to higher authority.

The whole country is under a single system of law and the single Supreme Court subordinated to the Central Executive Committee, whose Presidium appoints 7 of the 11 members of the bench, and to which body the public prosecutor may appeal cases for final decision. One of the members of the court is a representative of the United State Political Administration (O.G.-P.U.). Under the constitution, each federated republic is required to function on a soviet basis, with a central executive committee and council of people's commissars. The Federation has exclusive control of foreign relations and alone may: alter the external boundaries of the Federation; settle boundary disputes between participating republics; conclude treaties for admission of new members, declare war and conclude peace; negotiate foreign and internal loans for the Union, as well as give permission for such loans to the federated republics; regulate foreign and domestic trade; inaugurate the general economic policy of the Union, control industry and grant concessions in the name of the Union and of the separate republics; manage transportation, posts, and telegraphs; organize and command the armed forces of the Union; approve the budget and levy taxes; establish a monetary system; direct the use of land and all natural resources; control migration; shape civil and criminal legislation, labor laws, and educational and sanitary legislation for the Union; establish a system of weights and measures; issue federal statistics; promulgate legislation concerning the rights of citizens and foreigners, and grant amnesty throughout the Union. It has the power to annul any unconstitutional measure of the federated republics, and to settle any dispute between them.

The federated republics retain the meagre rights of sovereignty and autonomy not withdrawn by the constitution. Each may amend its constitution within the limits set by the federal constitution. No boundary of a republic may be altered without its consent. Any republic may withdraw at will from the Union. In short, the participating republics are given a semblance of sovereignty within their respective territories, while the absolute and final control of all important affairs, both foreign and internal, rests in the hands of the Federal government in Moscow.

The Communist Party with its 600,000 disciplined adherents is the ruling group in a nation of 149,900,000 people. The oligarchical control of the Communists is facilitated by a singularly effective indirect system of election. The electoral system of the soviets is ultimately based

not on a territorial unit, such as a state, county, or township, but on an association unit, such as a factory, a soviet institution, a regiment, or ship, each body being dominated by a so-called nucleus of Communist Party members, so that the perpetuation of the power of the Communist Party is assured. Because of the impracticability of the economic-unit system in rural communities, where each farmstead represents a unit, delegates are there elected from administrative units, i.e., the village or *volost* (group of villages); but due to the system of graduated elections in the case of rural communities, passing through several successive stages before members of the central Congress (of a federated republic) are finally elected, whereas the cities and the larger industrial corporations send their representatives direct to the Congress, the votes of the masses of peasantry are quite effectively submerged.

Although a large or overwhelming majority of the delegates elected on the primary ballots in any one province or district may be non-Communist, the final ballots turn out 100 per cent Communist representation in the supreme legislative body, the Central Executive Committee of the Congress of Soviets. At its annual meeting, the Communist Party elects a central committee of 40 members, which in turn elects a political bureau consisting of seven members and four alternates. Through this body, the Communist Party directs and controls the policy of the Soviet government. Once a policy is decided on by the Political Bureau, it is referred to the Central Committee of the Communist Party, which passes it as a matter of course and has it approved by the Central Executive Committee of the Union, which it controls absolutely. To prevent friction between the various important organs of party and state, the same Communists hold offices in a number of organs, thus creating a political interlocking directorate. In the last analysis, therefore, the real governing power in Russia is the Communist Party.

Education. Public education in the Soviet Union is a charge against the six constituent republics and against the localities concerned. Local appropriations are in the aggregate somewhat larger than those of the republican government. In 1927-28, total appropriations for education were upward of \$400,000,000, as compared with \$317,200,000 in 1926-27 and \$236,400,000 in 1925-26. In 1927-28, 11,308,333 children were in 116,373 primary and 1819 secondary schools (excluding kindergartens), nearly 46 per cent more than before the World War. There were 118,192 of these schools, as compared with 106,400 in 1913. The teaching staff numbered 337,435. In the cities, 98.4 per cent of the children of school age were in school, and in the rural districts 66.4 per cent. Since the famine year of 1921, enrollment in the schools has shown a steady growth.

In colleges and universities, the growth had been commensurate. There were 137 of these institutions in 1927-28 with an enrollment of 143,000. In addition, 4711 higher trade schools had 601,000 students. To combat illiteracy, there were conducted 46,759 schools for adults in 1926-27 with 1,516,000 pupils, as compared with 1,635,000 pupils the previous year. Among the general population (above seven years) illiteracy had decreased by one-third between 1922 and 1928. The census of 1926-27 revealed that 65.4 per cent of the males were literate and 36.7 per

cent of the females. In the last pre-war census (1897), the figures were, respectively, 37.9 and 12.5 per cent.

Agriculture. Agriculture occupies an unusually important position in Soviet Russia, not only on account of the predominantly agricultural character of the country, but also because grain, and particularly wheat, is one of the principal export commodities on which the state depends for its favorable trade balance, so essential in view of its economic relations with the outside world. From an economic, as well as a political, viewpoint, agriculture presents a striking contrast to industry and trade, in that it is still primarily based on private ownership and offers some great inherent difficulties which have so far resisted the efforts of the Soviet government to place it on a socialized basis. There is a conflict between the desire for export grain and the necessity, from the Soviet point of view, of preventing the development of the class of well-to-do peasants. Under present conditions, it is the latter class who are most capable of producing the surplus grain for export; on the other hand, they are also most anxious to gain access to the free market and are opposed to the existing system of state control of the grain trade.

In dealing with this problem, the Soviet government has decided on two broad policies. One is to increase considerably the budget appropriations for the promotion of agriculture, but to distribute the assistance in such a way as to encourage the small and medium-sized proprietors and to discriminate as much as possible against the well-to-do peasant, or *kulak*. As the assistance takes largely the form of credit in the way of seeds, agricultural machinery, and fertilizer, as well as relief from taxation, it should prove comparatively easy to carry out the negative phase of that policy. The other policy calls for a more energetic effort to build up the collective forms of agriculture under direct state control. This is to be accomplished by a more systematic development of the existing communal farms, of which there are a considerable number, but which by 1929 have had no important influence on the grain supply, and by encouraging the less individually minded peasant to go into that form of communal farming. This policy involves the organization of large state farms or "grain factories," as they are referred to in the Soviet press, which by utilizing the latest technique of mass production are intended to assure the Government a dependable supply of surplus grain to carry out the programme of industrialization.

The above plans should be considered in connection with the traditional low level of agricultural technique in Russia and the uncertainties inherent in the nature of the industry which, although common to all agricultural countries, are of special significance to Russia on account of its present position of virtual economic self-sufficiency.

In 1926 there were in Soviet Russia (European and Asiatic) 399,843,000 acres of plowed land, 7.6 per cent of the total area, 173,354,000 acres of meadow and pasture, and 982,047,000 acres of forests. In European Russia, the proportion of land cultivated is high, where soil and climate permit. In the Asiatic territory, there are vast areas too dry or too cold for agriculture. The total value of agricultural production for the year 1926-27 was reported as \$6,574,000,000, of which grain was \$1,945,000,000; animal products, \$1,711,000,000; and other farm products, \$1,971,000,000.

CROPS: AREA, PRODUCTION, AND YIELD PER ACRE, U. S. S. R.											
Crop	Area (thousands of acres)				Production (thousands of units—bushels, except as indicated)				Yield per acre (bushels)		
	1923–1925	1925	1926	1927	1923–1925	1925	1926	1927	1923–1925	1925	1927
Wheat	48,850	59,770	70,873	75,944	461,259	713,000	819,565	749,559	9.5	9.9

• 1921-1925.

• Unit, metric ton.

• Unit, pound.

• Season ending following year.

• Not including Turkestan and Transcaucasia.

Agricultural production for 1927-28 was valued at \$6,836,200,000, or 108.2 per cent of the 1913 production (figure includes returns of farms, forests, fisheries, stock raising, and hunting).

In 1928 the grain crop was 74,292,103 metric tons from 98,698,000 hectares, as compared with 74,128,000 metric tons in 1927. The wheat crop (included above) was 22,399,000 metric tons, as compared with 20,389,000 in 1927. Total pre-war production of all grain in the same territory was estimated at 75,000,000 metric tons. The cotton crop of 1928 was estimated at 860,000 tons (unginned), as compared with 632,000 tons in 1927 and 744,300 in 1913. Other technical crops registered gains, except sunflower seed, which showed a decline of 16 per cent from the year 1927.

At the beginning of 1928, horses numbered 30,931,000; cattle, 67,327,000; and swine, 20,222,000. All classes of live stock except horses were above the pre-war figures. In the autumn of 1928, there were 32,000 tractors in use, as compared with 500 in 1913. Owing to the fact that the grain crop of 1927 was about 2,000,000 metric tons less than that for 1926, coupled with increased consumption, grain exports for the agricultural year ending June 30, 1928, fell to 520,000 metric tons, from 3,086,000 the previous year. Due to failure of crops in the Ukraine, the 1928 acreage in grain was 15,000,000 acres less than in 1927. Preliminary data received by the Central Statistical Administration indicated an increase for 1929 of from 5 to 6 per cent over the 1928 acreage. The area sown to cotton in 1929 was 3,142,000 acres, an increase of 18.4 per cent over the 1927 acreage and of 82.3 per cent over the 1913 acreage.

Industry. The total value of industrial production was reported as \$6,768,000,000 in 1926-27, an increase of 10.4 per cent over the previous year. The value for the "census" or large-scale industries was \$5,720,000,000 and that for small-scale industries was \$1,049,000,000. About 90 per cent of all industries is controlled by the state. The value of the 1927-28 industrial output, at pre-war prices, was given at \$4,822,975,000, or about 26 per cent above the 1913 figure.

The average number of workers in coal mines during 1927-28 was 224,173; in iron and steel, 551,656; in the chemicals industry, 76,511; in the textile industries—cotton, 498,930; wool, 62,005; linen, 87,562. In all large state industries, there were about 2,164,580 workers employed during 1927-28. Including small plants, but not counting village and town handicraft industries, the total is about 15 or 20 per cent larger.

The aggregate output of electric-power stations in all industrial branches was placed at 527,000 kilowatt hours, of which 132,300 kilowatt hours were used in the iron and steel industry, 100,300 in the coal-mining industry, 58,000 in the machine-building industry, 71,600 in the textile industry, and 33,200 in the silicate industry. The capacity of all electric stations in 1929 was estimated at 2,638,000 kilowatts. About 56 per cent of the energy supplied goes to industries, 28 per cent for lighting purposes, and 16 per cent for tramways.

INDUSTRIAL PRODUCTION

(Figures for 1927 and 1928 are for 12 months ending Sept 30)

		1913	1927	1928
Coal	1000 metric tons	33,814	30,913	36,300
Petroleum	1000 bbls	62,834	74,439	83,327
Peat	1000 metric tons	1,500	4,703	4,900
Iron ore	do	9,514	4,815	5,977
Manganese ore	do	1,221	1,618	1,155
Pig iron	do	4,207	2,963	3,281
Steel (Martin)	do	4,246	3,586	4,150
Rolled iron	do	3,509	2,731	3,367
Copper (smelter)	metric tons		16,500	15,900
Gold (90 per cent fine)	pounds	135,864	93,600	102,000
Cement	1000 metric tons		1,557	1,837
Glass	metric tons		282,000	328,000
Acids	do		257,575	294,684
Alkali	do		242,612	284,777
Salt	1000 metric tons	1,998	1,908	2,180
Sugar	do	1,513	1,337	1,885
Cigarettes	millions	25,888	39,445	
Wood pulp	metric tons		128,300	132,000
Paper and card-board	do		279,500	306,196
Matches	millions boxes	3,703	4,200	5,457
Cotton yarns	tons		264,400	312,600
Cotton cloth	millions yards		5,247	5,604
Woolen yarns	tons		41,200	46,300
Woolen cloth	1000 yards		185,286	214,510
Linen yarns	tons		67,612	63,184
Linen fabrics	1000 sq yards		232,924	210,173

The growth of textile equipment (in thousands) is shown below:

Item	Cotton		Wool		Linen	
	1926-27	1927-28	1926-27	1927-28	1926-27	1927-28
Spindles	6,151	6,217	248.5	252	278.3	275
Looms	158.2	159.1	8.1	8.2	11.1	10.8

The industrial output for 1927-28 was over 20 per cent above 1926-27 and 25 to 30 per cent above the pre-war level. The year was the first since the War in which the industrial advance was dependent wholly on new construction and equipment. In 1921 the industrial output was only 15 per cent that of 1913. The only large-scale industry still below the pre-war level in 1928 was that of ore mining.

Foreign Trade. Foreign trade in Soviet Russia is a state monopoly and is carried on by the Commissariat of Foreign Trade through vari-

ous official institutions and branches within the Soviet Union, which are represented by foreign-trade delegations abroad, chiefly at Berlin and London, and by corporations organized under the laws of the respective countries in the form of commercial companies, whose entire stock, however, is held by the Soviet government. With the expansion and ramification of foreign-trade operations, it became impossible for the central Commissariat to handle the entire volume of trade, and a system of licensing the largest commercial and industrial bodies to carry on their trading operations independently of the Commissariat was resorted to. During recent years, several private concerns also have been

33 per cent. The trade over the Asiatic frontiers, which is principally with Persia, China, and Japan, increased by about 50 per cent in 1927-28. The trade over the European frontiers was: Exports, 635,481,000 rubles; imports, 820,059,000 rubles; total, 1,455,540,000 rubles (\$744,453,000), an increase of 12 per cent over 1926-27.

The principal exports are grain, oil products, furs, timber, butter, eggs, manganese ore, and oil cakes. The principal imports are raw cotton, industrial machinery, agricultural machinery including tractors, metals, leather, wool, tea, and paper. In 1927-28, nearly 90 per cent of the imports consisted of production goods, i.e., raw materials and machinery.

SOVIET IMPORTS ACROSS EUROPEAN FRONTIERS

(Fiscal year beginning October 1)

[In rubles—1 ruble = \$0.515]

	1924-25	1925-26	1926-27	1927-28
Industrial equipment	68,891,000	108,741,000	146,406,000	247,300,000
Raw materials and semi-manufactured products	315,897,000	365,298,000	381,617,000	435,983,000
Including:				
Cotton	121,897,000	104,450,000	120,651,000	134,866,000
Wool	39,240,000	31,448,000	35,323,000	42,582,000
Hides	15,417,000	22,857,000	37,650,000	38,508,000
Other	139,343,000	206,543,000	187,993,000	220,027,000
Agricultural machinery and tractors	28,883,000	43,028,000	23,040,000	20,678,000
Consumers' goods	195,766,000	117,144,000	45,308,000	95,261,000
Miscellaneous	34,835,000	39,466,000	27,438,000	20,837,000
Total imports	643,772,000	673,677,000	623,809,000	820,059,000

SOVIET EXPORTS ACROSS EUROPEAN FRONTIERS

	1924-25	1925-26	1926-27	1927-28
Grain	51,280,000	155,763,000	201,787,000	34,228,000
Butter	27,575,000	30,850,000	84,224,000	39,120,000
Eggs	25,657,000	23,629,000	28,954,000	40,462,000
Poultry	5,025,000	2,936,000	7,112,000	10,687,000
Meat	1,132,000	2,305,000	4,850,000	16,073,000
Flax and tow	52,200,000	43,919,000	19,267,000	20,703,000
Furs	60,078,000	63,220,000	80,319,000	113,990,000
Timber	63,209,000	52,498,000	71,135,000	80,256,000
Oil products	62,767,000	69,487,000	82,813,000	98,239,000
Manganese ore	17,891,000	21,285,000	24,090,000	13,752,000
Miscellaneous	141,030,000	123,232,000	132,689,000	167,971,000
Total exports	507,844,000	589,124,000	687,240,000	635,481,000

authorized to carry on the foreign trade within certain limitations as to the nature and the outside amount of imports permissible and subject to an equal division of all profits with the Soviet government.

The foreign trade turnover over all frontiers is shown in the following table:

1913	\$1,490,495,000
1922-23	199,300,000
1923-24	484,910,000
1924-25	666,925,000
1925-26	733,130,400
1926-27	762,869,500
1927-28	886,830,000

The unfavorable balance of trade for 1927-28 was \$88,580,000, as compared with a favorable balance of \$28,989,500 for 1926-27. The change was due to the big drop in grain exports. Exports other than grain increased in 1927-28 by

The principal countries taking Soviet exports are England (26 per cent), Germany (22 per cent), Latvia (7.5 per cent), France (7 per cent), and Persia (5.6 per cent). The principal countries furnishing Soviet imports are Germany (23 per cent), United States (20.5 per cent), England (14.2 per cent), and Persia (5.4 per cent).

The principal Soviet imports from the United States are cotton, industrial equipment, agricultural machinery, metals, chemical products, binder twine, automotive equipment, and typewriters and adding machines. According to figures of Soviet trade organizations in the United States, purchases of American products for shipment to the Soviet Union in 1927-28 aggregated close to \$100,000,000, or about two and a half times the annual pre-war figure.

Soviet purchases in the United States, by commodity groups during recent years:

	1925-26	1926-27	1927-28
Raw materials	\$34,515,306	\$50,230,991	\$37,990,612
Semi-manufactured goods	622,974	1,924,948	1,491,398
Industrial and electrical equipment	4,085,742	10,867,479	12,209,845
Automotive equipment	291,311	1,614,166	2,802,295
Agricultural machinery, live stock, etc.	8,117,053	6,617,953	15,199,157
Other goods	1,060,911	716,715	1,537,843
Total	\$48,693,297	\$71,971,715	\$91,231,048

The principal Soviet exports to the United States are furs, manganese, precious metals, sheep casings, flax and tow, hides and skins, bristles, and licorice root.

The figures for American-Russian trade by Soviet customs statistics, are as follows.

	Exports to United States	Imports from United States
1913	\$ 7,290,000	\$ 40,730,000
1923-24	4,377,500	49,955,000
1924-25	14,471,500	103,618,000
1925-26	15,759,000	62,881,500
1926-27	11,948,000	74,984,000
1927-28	14,368,500	91,231,048

Finance and Currency. The process of currency inflation and depletion of the gold stock in Russia started soon after the outbreak of the War. The Imperial régime, however, increased the outstanding notes only moderately and did not differ in this respect from the inflation policy prevailing in almost all belligerent countries. Shortly after the outbreak of War, the statutory restriction which provided that the paper money issued by the Imperial Russian Bank should not exceed its gold reserve by more than 3,000,000,000 rubles was abolished, and the right to convert paper rubles freely into gold was abrogated. On July 27, 1914, the outstanding notes amounted to 1,633,000,000 gold rubles and were covered by 1,744,000,000 gold rubles, a reserve of 107.4 per cent. During the three years and four months between the outbreak of war and the inauguration of the Soviet régime, the paper in circulation increased over elevenfold. The Soviet decree of July 25, 1918, made "the purchase, sale, or possession of precious metals in bullion or gold punishable by imprisonment of not less than 10 years in hard labor and the confiscation of the entire property of the culprit." The only currency authorized was the Soviet paper ruble, not backed by any reserve or security but circulating by virtue of its acceptance by all government institutions, trusts, and trading-stores. With the inauguration of the "new economic policy" and the legalization of private trading, the Soviet ruble began to depreciate rapidly. When trade with the outside world was resumed, involving purchases on a large scale from the peasantry and the concomitant exhaustion of the gold reserve appropriated by the Soviet government, heavy budget deficits began piling up; these were met by more issues of paper money, and inflation assumed gigantic proportions.

The decree of Oct. 17, 1920, designated the possession of gold, silver, platinum, foreign exchange, etc., as legal, but subject to compulsory delivery to the state against a compensation fixed by the Commissariat of Finance according to average market value. All transactions in valuables or currency were still completely prohibited. The decree of Nov. 18, 1921, granted to the State Bank the monopoly of purchase and sale of foreign currency and precious metals in coin and bullion. From this indirectly followed the right to sell money or valuables to the State Bank but not to purchase them from the Bank. The decree of Apr. 4, 1922, abrogated the principle of compulsory delivery to the state of property in precious metals or foreign exchange; but it permitted the free circulation of precious metals in the form of bullion only, leaving in force the monopoly of the State Bank on the purchase and sale of coin and foreign exchange. By decree of July 27, 1922, state and cooperative institutions were permitted to accept gold or pre-

cious metals in coin in payment for goods or services, provided immediate deposit thereof was made to their accounts with the State Bank.

In December, 1922, the issue of so-called *chervonets*, bank notes by the State Bank was authorized; these eventually became standard currency. These notes of 10-ruble denomination were secured according to law by gold, silver, and stable foreign exchange, to the extent of not less than one-quarter of face value, the balance being covered by drafts, notes, warehouse receipts, and other transferable collateral. Ever since the inception of its note issue, however, the State Bank has maintained the gold security in reserve of the *chervonets* notes at 50 per cent of face value. The decree of Jan. 29, 1923, abolished the monopoly of the State Bank on purchase and sale of foreign currency and admitted trading in gold and silver bullion, in foreign currency, and in checks and bills of exchange. The *chervonets* notes have retained their parity with the gold ruble in terms of Soviet currency and circulate at par with the pound sterling and practically so with the dollar. At the same time, the sound or purchasing value of the entire mass of paper-ruble currency outstanding was dropping precipitously. On Jan. 1, 1923, it was estimated at 101,900,000 gold rubles, on June 1, at 88,702,000, on Jan. 1, 1924, at 59,500,000; and on February 1, at only 39,000,000 rubles. The total Soviet paper money in circulation on Jan. 1, 1924, was about 178,000,000,000,000 rubles. Of this astronomical amount, 31,000,000,000,000,000 had been issued in October, 45,000,000,000,000,000 in November, and 80,000,000,000,000,000 in December. By Jan. 1, 1924, *chervonets* bank notes assumed a predominant position as a medium of exchange. A series of decrees promulgated during the last week of February and during March, 1924, introduced a reform in the Russian monetary system. By a decree effective on February 15, the Soviet paper ruble was abolished, and the *chervonets* bank note was made standard currency. By the second and third decrees issued on February 29 to regulate application of the first decree, the system of reckoning in index rubles based on 1913 prices was abolished, and the payment of fixed wage rates in *chervonets* rubles was substituted for their payment in Soviet currency, as based on the cost-of-living index. On Mar. 10, 1924, announcement was made that Soviet paper currency would be redeemed for *chervonets* notes at the rate of 500,000 rubles of 1923 issue (each of which is equal to 1,000,000 original Soviet rubles), for one *chervonets* ruble. Treasury bills of 1-, 3-, and 5-ruble denominations were put in circulation instead, not backed by any security but exchangeable for *chervonets* notes at any of the state-controlled banks. In addition, silver and copper coin was put in circulation. By May, 1, 1924, there were issued 87,000,000 rubles of the new Treasury bills, 20,000,000 rubles of silver, and 3,000,000 rubles in copper, a total value of 110,000,000 rubles of fractional currency; the amount of *chervonets* bank notes in circulation rose to 305,000,000 rubles, making a total of 415,000,000 rubles in circulation, with the fractional currency amounting to about 25 per cent of the total, as against 40 per cent prior to the War.

By the end of June, 1924, Soviet currency was established on a gold basis, and since that time there have been no unsecured paper issues. The budget of Soviet fiscal years, ending September 30, in millions of rubles (1 ruble equals \$0.515) were as follows:

	1924-25 (actual)	1925-26 (actual)	1926-27 (actual)	1927-28 (actual)
Revenues	2,905 1	3,900 7	5,201 3	6,426 9
Expenditures	2,875 6	3,867 8	5,151 3	6,008.

Revenues for 1927-28 showed gains in all departments except the agricultural tax, as compared with the preceding year. Revenues from loans were 670,000,000 rubles, an increase of 142 per cent over the same period of the preceding year. The Federal budget for 1928-29 was fixed in preliminary figures at 7,731,500,000 rubles.

Currency in circulation on Jan. 1, 1929, was 2027.8 million rubles, as compared with 1670.8 million rubles on Oct. 1, 1927. The retail-price index (prices of 1913 equal 100), as of Oct. 1, 1928, was 210 8, as compared with 198 as of Oct. 1, 1927. The wholesale-price index was 176.1, as compared with 170 the previous year. The balance sheet of the State Bank as of Oct. 1, 1928, showed liabilities and assets of 4,371,397,000 rubles, and increase of 508,203,000 rubles, as compared with Oct. 1, 1927. The capital was 250,000,000 rubles. Deposits and current accounts were 1,553,125,000 rubles, an increase of 260,196,000. Assets of bullion, coin, precious metals, and foreign currency were 291,022,000 rubles, a decrease of 8,900,000.

Transportation. In 1929 the railway mileage of the Soviet Union was 48,125 miles, as compared with about 36,000 in 1913 and 42,000 miles in 1917. Under the five-year plan drawn up for the railways, construction of 11,500 miles of line is planned for the period, to cost \$950,000,000. In 1926-27 the revenues from operation were \$768,277,000 and expenditures \$650,960,000, giving a net profit of \$117,317,000, as compared with \$91,567,000 the previous year. In 1927-28 revenues from operation were \$898,675,000. Average daily freight loadings were 31,183 in 1926-27, as compared with 27,808 the previous year. Freight transported in 1927-28 totaled 150,611,000 tons, as compared to 135,728,000 tons in 1926-27. New locomotives built in Soviet plants during 1927-28 numbered 480, as compared with 441 the previous year. The number of permanent and temporary employees in 1927-28 was 1,070,000. There were 7000 miles of airplane lines in operation in 1928.

Internal Waterways. The length of navigable mileage in European Russia amounts to 25,545 miles and in Asia to 30,100 miles, besides longer mileage suitable for rafting purposes only. The river fleet in 1913 within the 1924 Soviet borders consisted of 3925 power-driven cargo boats of 682,528 aggregate indicated horse power; 20,573 sailing and other vessels, with a total capacity of 12,907,000 long tons. On Jan. 1, 1926, on the inland waterways, there were 3245 vessels of 530,278 tons, of which 464,789 tons were state owned. The volume of river transport in 1913 was 44,364,000 long tons and 16,200,000 passengers. In 1928 the amount of goods transported was 37,000,000 metric tons and the number of passengers carried in 1927 was 15,900,000.

Merchant Marine. In 1914 there were 1005 steamships, averaging 826 tons gross registry, of average capacity of 487 tons; 55 motor-driven vessels of 380 tons deadweight average, and 238 tons average capacity. In 1927 the merchant marine consisted of 346 vessels (of 100 tons or more) of 308,882 gross tons.

History. The outbreak of the War in August, 1914, produced a mighty demonstration of Russian Pan-Slavism. Internal dissensions and

strikes were submerged in a wave of patriotism. The Duma rallied to the support of the Czar, and the representatives of dissident nationalities made striking asseverations of loyalty. All Russian political groups, except the Bolshevik wing of the Social Democratic Party, expressed their resolution to spare no effort in assisting the Government to maintain the country's integrity and to defend coreligionists and kinsmen abroad. Even leading anarchists espoused the national cause with enthusiasm. The Government made some attempt to conciliate discontented minorities. The struggle with the Finnish Diet was suspended; the Poles were promised, by proclamation of the generalissimo, Grand Duke Nicholas, a grant of early autonomy and ultimate reunion under the Russian sceptre with their fellow-nationals of Germany and Austria, and restrictions on Jews, Catholics, and Lutherans lapsed temporarily. The permanent abolition of the sale of vodka decreed shortly after the beginning of hostilities met with widespread popular support. Large social groups were organized to aid in the prosecution of the War: local provincial councils formed the All-Russian Union of Zemstvos, and Municipal Councils were similarly federated into a national society. These bodies rendered valuable service in auxiliary relief work, although continually hampered by a suspicious attitude on the part of the national Government. The dynasty had been given a unique opportunity to retrieve its misdeeds and blunders by placing itself wholeheartedly at the head of a great popular movement; but Czar Nicholas II, although well-meaning, was narrow-minded and weak. Surrounded by reactionary nobles, priests, and bureaucrats, he "utilized the temporary heat of national altruism and patriotism in order to forge iron links in the chain of social inequality and political absolutism."

The Russian invasion of East Prussia met with an overwhelming catastrophe in the Battle of Tannenberg, but simultaneously Russian arms gained signal successes against the Austrians in Galicia. Reform in Poland was delayed while reactionary and ultra-nationalistic officials devoted themselves to energetic measures for Russifying conquered Galicia. During the winter of 1914-15, although the Russians held their own on the eastern front, they showed few signs of sweeping like a "tidal wave" on Berlin or Vienna, as optimistic Allied publicists hoped. At the opening of the Duma in February, 1915, Premier Goremykin expressed unwavering confidence in ultimate victory, and the majority of the Legislature seemed to share his faith. Meanwhile, the Russian Foreign Minister, Sazonov, had taken diplomatic measures to insure the acquisition of Constantinople. The Czar's Government hailed with delight the opportunity afforded to declare war on Turkey (Oct. 31, 1914). On Nov. 14, 1914, the British Ambassador at Petrograd informed Sazonov that Russia might have Constantinople, and during the following March (1915), a secret arrangement was consummated with France and Great Britain, whereby Russia was also to get the whole of Turkey in Europe except a district around Adrianople and Kirk-Kilisse; the Asiatic shores of the Bosphorus; and about 80 miles of the Black Sea coast in Asia Minor, all in return for according the British and French like satisfactions in other regions. At that very moment, an Anglo-French expeditionary force was engaged in trying to force the Dardanelles in response

to a Russian plea for a relief of pressure on the Caucasus front, where the Turks had concentrated their main strength. Russia failed to cooperate with the Allies in that tremendous undertaking, so vital to her interests and so essential to Entente victory, and with what now appears to have been consummate folly, fathered by greed, the Russian cabinet definitely vetoed the plan to obtain Greek military aid in opening the Straits; the Greeks, so Petrograd feared, might preempt Constantinople. The débâcle which eventuated had a direct causal effect on Russia's subsequent collapse, since it deprived her of a line of communications which, if kept open, would have facilitated the shipment of supplies and munitions to her poorly armed legions. In a struggle of machinery and specialized technical equipment such as the War was proving, Russia was ill prepared for battle; a land of primitive agriculturists, in a semi-feudal society, geographically cut off from assistance, she lacked the requisite resources and industrial organization.

The year 1915 had opened rather brightly for Russia. To be sure, the Government was experiencing great financial difficulties, but France and Great Britain lent valuable assistance in sustaining Russian credit, and a large loan was floated in America. In the spring and summer of 1915, the armies in the west being deadlocked, a gigantic Teutonic force was concentrated on the eastern front, and the Russians suffered a series of disastrous defeats. Russian generals, several of whom had conspicuous ability, were grievously handicapped by intolerable social and economic conditions. Russia's illiterate peasant armies, valorous but woefully short of munitions and supplies, could not cope on equal terms with the disciplined and well-armed troops of the Central Powers. During May and June, General von Mackensen, with combined Austro-Hungarian and German Armies, expelled the Russians from Galicia, immediately thereafter, General von Hindenburg, the victor of Tannenberg, directed a mighty thrust at Russian Poland. By October, 1915, all of Poland, together with most of Lithuania and Courland, was in the hands of the enemy powers, and the military prestige of Russia was destroyed. Up to October, 1915, Russia had lost approximately 2,500,000 men—500,000 dead, 1,000,000 wounded, and 1,000,000 taken prisoner.

The Meeting of the Duma. The reverses in the field had profound repercussions on political life. Patriots assailed the Government for its criminal inefficiency and accused leading generals of incompetence. An early session of the Duma and the selection of a really representative national ministry were demanded. Premier Goremykin made some concessions to the critics. He superseded his unpopular Minister of the Interior, Makarov, by the more liberal Prince Cherbátov. On June 25, Sukhomlinov resigned the war portfolio and was replaced by General Polianov. Other reactionaries were dismissed and more acceptable conservatives appointed to succeed them. These changes postponed the impending crisis, but the situation was serious in the extreme when the Duma reassembled on August 1. The Duma, while expressing fervent loyalty and patriotism, demanded that the Government collaborate with the people in a more democratic spirit. Goremykin promised fuller cooperation in the work of national defense and planned to create advisory boards including ex-

perts and delegates from the Zemstvos, Municipal Councils, the Duma, and the Council of the Empire, to assist the ministers of war, commerce, communications, and agriculture. The Duma liberals, aroused by revelations of treason and corruption in government and army circles, demanded greater reforms. In late August and early September, 1915, under the leadership of the Constitutional Democrat, Milyukov, a bloc of liberal and moderate groups was constituted, embracing all elements in the Duma except the extreme reactionaries and Nationalists on the Right and the extreme radical Social Democrats on the Left. The programme of the bloc involved (1) the reconstruction of the ministry on a more representative basis; (2) the reconciliation of discontented nationalities and aggrieved social classes; (3) the reform of local administration; (4) punishment of delinquent commanders and officials; and (5) the vigorous prosecution of the War. Simultaneously (September 5), the Czar with a magnificent gesture assumed nominally supreme command of the army, and Grand Duke Nicholas was transferred to the Caucasus.

After the German drive had spent its vigor, reaction triumphed over reform. To the consternation and anger of the Liberals, an imperial decree unexpectedly prorogued the Duma (September 16). In October, Khovostov, from the extreme Right in the Duma, replaced Cherbátov as Minister of the Interior, with the avowed purpose of strengthening the machinery of "benevolent but firm authority." One ministerial change followed another until on Feb. 1, 1916, "the very acme of reaction was reached with the retirement of Goremykin and the succession of Boris Sturmer, an ultra-conservative and an oppressive landlord reputed to be pro-German in his personal sympathies."

The Sturmer Ministry. The opening days of the new administration were signalized by important Russian victories in Asia Minor, including the capitulation of the great Turkish stronghold of Erzerum (February 16). The Duma, reconvened on February 22, was honored for the first time by the personal attendance of the Czar. Nevertheless, relations with the ministry continued critical and controversial. Finance occasioned a sharp debate, an income tax was levied, and recourse was had to British, French, and American loans. Liberal groups denounced the Government for its failure to establish a greater measure of political liberty and for its harsh treatment of Finns and Poles. There was also a disorderly debate on the continued persecution of the Jews. New changes in the ministry followed these attacks. Khovostov and Polianov resigned the interior and war portfolios, respectively, and General Sukhomlinov, the ex-Minister of War, was imprisoned for treasonable negligence in conduct of his office. Meanwhile, Russia's military fortunes were appreciably reviving. During the winter of 1915-16, Russia's lines were reformed, her arsenals replenished, and her command reorganized. In the summer of 1916, she cooperated with the Allies in a series of coordinated offensives. Under General Brussilov, the Russians inaugurated a vigorous drive along the Sereth River at the beginning of June. By the middle of August, the entire Province of Bukovina had been conquered and some 350,000 men taken, together with enormous stores of equipment. Russia's sudden rise reassured all the Allies. It contributed

to Allied successes in the West, and it was the chief factor in encouraging Rumania to enter the War on the side of the Allies (August, 1916). Russia, however, consented with ill grace to Rumanian demands for future compensation and subsequently displayed short-sighted duplicity in neglecting to aid her neighbor and ally against the terrific Teutonic onslaught. Meanwhile, the internal situation in Russia had grown alarming, for the recovery of the army from its defeats and demoralization in 1915 was not accompanied by a restoration of political stability at home. The Czar and his advisers had learned no lesson. They persistently ignored the symptoms of economic distress manifest throughout the empire and gave no consideration to widespread demands for political reform. Against the Stürmer ministry, a mass of grievances speedily accumulated. The Premier muzzled public opinion, forced the resignation of the patriotic Sazonov, appointed extreme reactionaries to office, prorogued the Duma from July 3 to November 14, promulgated obnoxious autocratic decrees, and endeavored to repress popular organization (especially the All-Russian Union of Zemstvos, the Union of Municipalities, and the War Industries Committee), formed to promote popular coöperation with the Government and to assist in the vigorous prosecution of the War. On October 4, Stürmer ordered all meetings of these organizations to be placed under police surveillance and entrusted the administration of the interior to Protopopov, the most zealous prosecutor of liberals in all Russia.

The Trepov Ministry. These measures aroused a storm of protest and united all factions against the Government. Shortly after the Duma met (November 14), Stürmer resigned, only to be succeeded by a reactionary of the same stamp, Alexander Trepov. The Duma did not relax its criticism. In the midst of a stormy session during the closing days of 1916, Professor Milyukov, leader of the Constitutional Democrats, vehemently assailed the Government, being supported by several other speakers who made sensational disclosures concerning the almost traitorously inefficient prosecution of the War. The Duma, the Imperial Council, and the Council of Nobles, all passed resolutions exonerating the "dark forces" tending to paralyze the national organism and to create confusion in all departments of the Government. Despite the spread of popular disaffection during the winter of 1916-17, the Government adhered to its traditional methods of secrecy, suspicion, repression, and intrigue. The Czar was hopelessly dominated by his consort, Czarina Alexandra Feodorovna, and she in turn was under the hypnotic influence of hypocrites and charlatans, especially the notorious Gregory Rasputin (q.v.).

Friend of Goremykin, Sukhomlinov, Stürmer, and Protopopov, with whom he coöperated to frustrate nascent liberalism and constitutionalism, Rasputin exercised such a baleful influence on the course of events that his assassination at the end of December, 1916, caused much rejoicing. It was a grim portent of immanent revolution. The situation at the opening of 1917 was extremely tense and abnormal. The armies at the front sullenly maintained their positions, but were war-weary and distrustful of their leaders. The factory workers were deeply affected by internationalistic and socialistic ideas, while the peasants were suffering from the heavy toll of conscriptions and the economic demands arising

from a war which they had never understood. The prevailing sentiment, especially among the intellectuals, was despair as to any improvement under the reactionary government.

The Golitzin Ministry. On Jan. 9, 1917, Prince N. Golitzin, a typical bureaucrat, replaced General Trepov as Premier. Other reactionary appointments followed, and the re-opening of the Duma was deferred from January 25 to February 27. The Government was openly charged with aiming "to provoke a futile rebellion, to suppress the rebellion by force, to quell by terrorism an agitation for reform, and to entrench Russian autocracy anew in power for another century." On February 25, a secret arrangement was concluded with France whereby Russia was to get a free hand in drawing her western frontiers, i.e., around Poland, in return for the granting of a similar freedom to France along the Rhine. This devious diplomacy was nullified by the subsequent course of events. A grave shortage of food in Petrograd and other cities made matters still worse. The Duma reconvened on February 27, amid overawing police guards. Workmen to the number of 100,000 in Petrograd and 25,000 in Moscow went on strike as a political manifestation on behalf of the Social Democrats. The food crisis became acute. Bread riots occurred. On Mar. 11, 1917, the Czar's government ordered the Duma and the Council of the Empire to dissolve and the workmen to return to their jobs. The workers refused to obey, and the Duma declined to disband, declaring that it was now the sole constitutional authority in Russia. The revolution was at hand.

The Revolution and the Provisional Government. After several days of critical uncertainty, the Petrograd garrison was won over, the organs of autocracy ceased to function, and the revolution spread with lightning speed to the armies in the field and to distant provinces. The forced abdication of the Czar (March 15) in favor of his brother, the Grand Duke Michael, and Michael's refusal to accept the crown unless it were proffered by the will of the people, ended the three-century rule of the Romanovs. In Petrograd, authority was divided between the Duma and a newly constituted Soviet (Council) of Workingmen's and Soldiers' Delegates. By an agreement between them, a bourgeois provisional government recruited from the Duma and responsible to it was established under the premiership of Prince George Lvov, a liberal landlord, president of the Union of Zemstvos and member of the Constitutional Democratic Party. His ministry embraced seven other members of his party, including Milyukov as Foreign Minister, three Octobrists, including Guchkov, who held the war portfolio, and one Social Revolutionary, Alexander Kerensky, as Minister of Justice.

The provisional Government was speedily recognized by foreign countries. With equal celerity, the policies of the discredited autocracy were reversed. Finland's constitution was restored; the Poles were promised unity and self-determination; and the Jews received a sweeping bestowal of equal rights. Thousands of political offenders were released from prison or recalled from exile. Freedom of speech, of association, of the press, and of religion were proclaimed, and it was announced that a National Constituent Assembly would shortly be designated by universal suffrage to frame a perma-

ment constitution for Russia. The new ministry advocated a democratic régime for revolutionized Russia, but "unlike the democracies of western Europe, the Russian revolutionary movement would have to base itself on an electorate of educated bourgeois and prosperous independent farmers than on a mass of illiterate, poverty-stricken peasants, and on noisy groups of ill-disciplined urban workers." Moreover, the great mass of peasants and proletarians were not satisfied with promises of political democracy and individual liberty; they desired a far-reaching social and economic transformation. More representative of the bulk of the Russian people than the bourgeois provisional Government were the extra-legal Soviets of Workmen's, Soldiers', and Peasants' Deputies, which, modeled on the initial Petrograd organization, were constituted throughout the country and in the army. The first National Congress of Soviets held at Moscow (April, 1917) demanded fundamental agrarian reform, the participation of workmen in the management of industry, the democratization of the army, and the continuance of belligerency only on the basis of a peace programme involving "no annexations and no indemnities."

There was a wide gulf between these aims of the Soviets, which were dominated in the rural regions by Social Revolutionaries and in the towns by the Menshevik faction or the Social Democrats, and those of the middle-class government of Lvov. The latter desired to subordinate internal reforms in Russia to the vigorous prosecution of the War. Milyukov, as Minister of Foreign Affairs, adhered to the diplomatic traditions of the old régime, favoring the maintenance of national prestige, cordial cooperation with the Allies, and the complete realization of imperialist aims as embodied in the secret treaties. The demobilization of the army, the war-weariness among the mass of the people, and the hostile attitude of the Soviets, forced the resignation of Milyukov, Guchkov, and other moderately conservative ministers, and on May 16, 1917, the ministry was reconstructed along more radical lines, Kerensky, as Minister of War, becoming the dominant figure, overshadowing Premier Lvov.

The Kerensky Government. Kerensky made strenuous efforts to terminate the War successfully, while simultaneously endeavoring to assure both political democracy and social reform, and although extremely eloquent and well-intentioned, the new leader lacked statesmanlike prevision, clearness of purpose, and strength of will. "After attaining to a unique position at the head of revolutionary Russia, Kerensky entangled himself in a net of contradictory measures, of ill-judged assertions of authority, and of weak-minded compromises and renunciations." His ministry encountered the opposition of Constitutional Democrats who feared anarchy, of the Bolsheviks who were growing more influential in the Soviets, and of German emissaries fostering separatism among the subject nationalities and pacifism among the soldiers, workmen, and peasants. He was unable to secure a repudiation by the Allies of the obnoxious secret treaties or a restatement of war-aims on the basis of "no annexations and no indemnities." Under the circumstances, it was impossible to infuse patriotic enthusiasm into the Soviets, and the disintegration of discipline in the army led to disastrous defeat during the attempted Brusilov offensive of July, 1917. All the gains of 1916

were obliterated in one crowning catastrophe, and the Germans extended their lines in the Baltic provinces. The Austrians recovered all of Galicia.

Even more alarming than these defeats at the front was the continued growth of internal chaos. Although, numerically speaking, it was a mere insignificant minority of the Russian people, the extreme faction of Bolsheviks which had consistently opposed the War since its outbreak, began in the spring of 1917 to acquire immense prestige among the war-weary masses who were more eager for the social millennium than for military victory. The Bolsheviks adhered to their principles in frankly repudiating political democracy and refusing to cooperate with the bourgeoisie or even with the Social Revolutionaries and Mensheviks in the hour of supreme national crisis. This subversive propaganda was facilitated by the return of a long-exiled leader, Nikolai Lenin (the pseudonym of Vladimir Ulianov), a man of noble extraction who had become a doctrinaire Socialist with an international reputation. Lenin's chief accomplice in his formidable assaults on Russian society and the provisional Government was Leon Trotsky (a pseudonym for Bronstein), a man of middle-class Jewish origin, who likewise had been a political exile and who returned to Russia in May, 1917. The Bolsheviks vociferously agitated for peace, outlined a tempting programme of immediate social reforms including expropriation of the landed nobility and industrial self-government, and made their slogan "All power to the Soviets." In June, at the All-Russian Congress of Soviets assembled in Petrograd under the presidency of the Menshevik leader, Tchaidze, Lenin pronounced a furious indictment of the provisional Government and of Kerensky. His attack was unavailing, however, and he was overruled by the moderates. Following the collapse of the Russian offensive in July, Prince Lvov and the other Constitutional Democrats in the ministry resigned (July 17). A Bolshevik uprising was repressed by Kerensky with the aid of the Menshevik Petrograd Soviet, Lenin fleeing to Finland where he remained until October. On July 20, Kerensky became head of the provisional Government. He still hoped to save Russia, but the odds were against him. An extraordinary conference representing various parties, the Zemstvos and municipalities, universities, the army, factory workmen, and peasant communities, which met in Moscow late in August, revealed a state of complete paralysis and confusion among the leaders of the country. In September, Kornilov, who had succeeded Brusilov as generalissimo, attempted to assume a military dictatorship, after concerting plans to that effect with Kerensky, but the latter turned against him and took control of the army. This affair caused a recrudescence of revolutionary zeal and a violent rush to the Left. Meanwhile, anarchy increased in everyday life. The peasants were seizing the large estates, dividing the spoils, and executing summary justice on those who had long oppressed them; urban workmen were dispossessing factory-owners. The Soviets called a Democratic Conference in Petrograd on September 27, to represent peasants and proletarians, but no bourgeois elements. All proposals for a new and more capable coalition government failed.

The Bolshevik Revolution. The weakness of

the Government was the strength of the Bolsheviks. Gradually, they supplanted the Mensheviks in control of urban Soviets, and by promising speedy agrarian reforms, they weaned the peasants away from the Social Revolutionaries and Kerensky. Trotsky, imprisoned after the July fiasco, was subsequently released, only to succeed the Menshevik president of the Petrograd Soviet and to renew his activities by organizing Red Guards subservient to Bolshevik wishes. During October, Kerensky made one last effort to bolster up his government by establishing a Council of the Republic with a membership drawn from all the political parties, and principal associations and institutions. It was of no use; the day of reckoning had come. The provisional Government had failed to fulfill popular aspirations or to overcome the force of opposition. By extravagant promises of peace, by irresponsible attacks on the much-harassed Government, and by the use of traditional political methods of intimidation and intrigue, the Bolsheviks managed to control a large majority of the delegates newly elected to the Congress of Soviets. Having formed a Military Revolutionary Committee and assured themselves of the support or benevolent neutrality of the Petrograd garrison, the Bolsheviks utilized their Red Guards to execute a *coup d'état* (Nov. 6-7, 1917). Kerensky had provided no adequate defense, and the conflict was brief. The members of the provisional Government were taken into custody, Kerensky alone evading capture. On November 8, the change was formally recognized by the All-Russian Congress of Soviets, which immediately sanctioned the establishment of a Council of People's Commissars with Lenin as Premier and Trotsky as Commissar for Foreign Affairs.

In accordance with the anti-capitalist tenets of their faith, with the anti-imperialist pronouncements of the Zimmerwald manifesto of 1915, and with their promises to the war-weary masses, the Bolsheviks resolved to conclude peace with the Central Empires at any price. Proposals to the Allied governments for the immediate conclusion of an armistice and the restatement of war-aims on the "no annexations, no indemnities" basis eliciting no answer, the Bolsheviks enraged the Entente rulers by publishing the "secret treaties." An armistice was concluded with Germany, Austria, Turkey, and Bulgaria at Brest-Litovsk on Dec. 17, 1917. Here on December 22, despite Allied protests, a formal Peace Conference was inaugurated. The idealistic peace proposals advanced by the Bolsheviks were accepted by the Germans "in principle" but entirely vitiated in practice. Early in January, the conference reached an impasse owing to extreme Teutonic demands and insistent Bolshevik propagandizing. On February 10, the Soviet government announced that it could not conclude peace but would not renew warfare. The Central Powers, however, terminated this solemn farce by reopening hostilities. Trotsky gave up the Foreign Office for the war portfolio and was succeeded by Tchitcherin, who cooperated with Lenin in bringing about a renewal of negotiations. A drastic set of peace terms was finally incorporated in the Treaty of Brest-Litovsk, signed on Mar. 3, 1918. By this convention, the huge and heterogeneous empire was diminished and transformed into an essentially national state of an area comparable with that existent before Peter the Great. The same period witnessed the retransfer of the national

capital from Petrograd (Peter's town) to Moscow. The Bolsheviks were obliged to relinquish Finland, Poland, Estonia, Livonia, Courland, Lithuania, Ukraine, Bessarabia, and part of Transcaucasia, which, although not annexed to the Central Powers, were dominated and economically exploited by them. Russia thereby lost 26 per cent of her population, 27 per cent of her arable land, 32 per cent of her average crops, 26 per cent of her railway system, 33 per cent of her manufacturing industries, 73 per cent of her total iron production, and 75 per cent of her coal fields.

Bolshevik Domestic Policy. In the meantime, the Bolsheviks were consolidating their power in such areas as still remained under their control. Internal opposition was repressed with an iron hand. By means of revolutionary tribunals and summary proceedings, they inaugurated a régime of systematic terrorism to extirpate reactionaries, hostile liberals, and lukewarm moderate revolutionaries. Among the many who perished in the years 1918-19 were ex-Czar Nicholas II and his family, who were killed at Ekaterinburg on July 16, 1918. Though the Bolsheviks expected that the state, which they regarded as purely a "capitalist organ," the tool of a dominant class in society, would be rendered superfluous with the ultimate realization of communism, nevertheless they believed that during the transitional period of "dictatorship" the proletariat would require an instrumentality of control fully as coercive as the capitalistic state. It was not political democracy, it was force which these would-be communists utilized to establish and perpetuate their rule. The National Constituent Assembly, finally elected by equal, direct, universal, and secret suffrage in November, 1917, embraced a considerable majority of social revolutionaries and others who were anti-Bolshevik in sympathy. The Council of People's Commissars, not finding this organ of democracy sufficiently subservient, postponed its meeting till January, 1918, and finally dissolved it altogether. The All-Russian Congress of Soviets, purged of militant anti-Bolsheviks, automatically became the supreme repository of legislative power.

Individual liberties, political democracy, and the prosecution of the War were all shelved while the new Bolshevik government embarked on a radical course of social and economic experimentation and revolution. A series of decrees issued in November, 1917, and subsequently, pronounced the doom of the capitalistic régime. All special privileges were abolished, and obligatory labor was enjoined on all citizens. Private ownership of land was abolished without compensation, and all real estate was nationalized, the peasants being permitted to occupy such land as they actually cultivated. Mines, forests, and railways were appropriated by the state, and factories were transferred to the management and operation of workmen. The national debt was repudiated, private banking resources confiscated, and foreign trade made a government monopoly.

The Russian Orthodox Church was disestablished on Jan. 23, 1918, and its wealth expropriated. No church organizations were permitted to own property. Private schools were suppressed and considerable attention was given to the development of national public schools, owned and directed by the state, in which loyalty to Bolshevik principles was to be inculcated.

The substance of these Bolshevik principles, precepts, and practices was enshrined in the constitution of the Russian Socialist Federated Soviet Republic, adopted on July 10, 1918, by the fifth All-Russian Congress of Soviets. By this document, all central and local authority was formally vested in Soviets of workers', soldiers', and peasants' delegates. For Soviet elections, all citizens and resident aliens over 18 years of age, male and female, who earned their living by "productive labor," and all revolutionary soldiers and sailors were enfranchised, but the right to vote was denied to all capitalistic producers, landlords, private merchants, clergymen, and certain other classes. The centre or source of all power was to be the All-Russian Congress of Soviets, consisting of representatives from the city Soviets on the basis of one delegate for every 25,000 electors, and from provincial Soviets on the basis of one delegate for every 125,000 inhabitants—the franchise being thus heavily weighted in favor of the urban workers, the main supporters of Bolshevism. The All-Russian Congress thus constituted was empowered to elect an All-Russian Central Executive Committee of some 200 and later 300 members to serve as the controlling executive, legislative, and administrative organ while the Congress itself was not in session. The Central Committee in turn was to designate a supreme central administrative cabinet, the Council of People's Commissars, composed of 18 members responsible to the Central Committee and through it to the Congress and subject to recall at any time. Individually, these commissars were to preside over various departments such as those of foreign affairs, war, interior, justice, labor, etc.; and collectively, they were responsible for the general conduct of affairs and the execution of Soviet policies. The commissars who exercised the real authority were thus about five steps removed from direct popular election and control, if such a thing might be said to exist in a country where the Bolsheviks (Communists), a mere minority party of some 600,000 highly disciplined members, controlled the machinery of government and the organs of public opinion. The drastic way in which they had fulfilled popular longings for peace, for land, and for proletarian privileges assured them a modicum of popular support; and this, together with their arbitrary use of force, kept them in power.

Foreign Interference and Counter-revolutions.—The Treaty of Brest-Litovsk, far from ridding Russia of the Teutonic "peril," proved a prelude to sustained intervention in her internal affairs during 1918. Such Russian economic resources as were susceptible to German seizure were exploited to bolster up Germany's war-weakened military and economic machinery then making its supreme effort on the western front. Separatist nationalities in Finland, Estonia, Latvia, Lithuania, Poland, and the Ukraine, emancipated from Russian control by the Treaty of Brest-Litovsk, were encouraged to set up anti-Bolshevik governments under German surveillance. In order to check Bolshevik propaganda in central Europe, financial, and military support was extended to Russian counter-revolutionary leaders. Only the complete collapse of the Central European coalition in October and November, 1918, saved Russia from further German interference.

The defection of Russia from the Allied cause was naturally resented by the governments of

France, Great Britain, Italy, Japan, and the United States. The revelation of the secret treaties, the negotiation of a separate peace, the repudiation of Russia's immense foreign indebtedness, the inauguration of a communistic régime with its attendant nationalization of property and inevitable reign of terror, all taken in conjunction with the apprehension aroused by the avowed Bolshevik ambition to effect a worldwide social revolution, infuriated Allied public opinion against Russia. In March, 1918, Allied intervention in Russia began in earnest, ostensibly to revive the eastern military front and to prevent German recuperation at Russian expense, but also with the ulterior purpose of setting limits to the activities of the Bolsheviks and of striking anti-capitalist communism in its very stronghold. A rigorous economic blockade was established, and expeditionary forces were landed at Murmansk in northern European Russia and at Vladivostok on the Eastern coast. Truly, the year 1918 was a period of terror and turmoil for all Russians. Even with the triumph of Allied arms in the War, intervention in Russia did not cease. "The Allies occupied northern Russia, the Crimea, and most of Siberia; members of the dissolved National Constituent Assembly set up at Omsk an anti-Bolshevik government which claimed to be the legal successor to Kerensky's provisional government, and certain reactionary Russian Army officers, such as Generals Denikin and Wrangel in southern Russia, and General Yudenitch, in the Baltic area, rallied Ukrainians, Cossacks, and adventurers to their standards, and with Allied support, undertook military campaigns against the Bolsheviks."

In the spring of 1919, the Paris Peace Conference, disturbed by the spread of Bolshevism, endeavored to find some solution of the Russian imbroglio, but no settlement could be attained (see *PEACE CONFERENCE AND TREATIES*). Following the breakdown of these negotiations, the Allied governments reverted to supporting the various counter-revolutionary factions which, in conjunction with the Allied expeditionary forces, hemmed in and harassed Soviet Russia from all sides.

Chaos reigned in all eastern Europe throughout 1919, but in the course of time, the Bolshevik government managed both to ward off foreign intervention and to suppress domestic revolts. The counter-revolutionists quarreled among themselves; the Russian proletariat and peasantry feared the triumph of reactionary royalism and the undoing of hard-won social and economic reforms; the spirit of nationalism impelled large numbers of non-Bolshevik Russians to cooperate in resisting foreign aggression; and finally the Allied governments had too divergent interests and were too exhausted by the long-continued strain of war to be able or willing to unite in a vigorous policy of coercion. The Allied expeditionary forces were withdrawn from northern Russia in the autumn of 1919 and, from Siberia in the spring of 1920, except Vladivostok, which remained temporarily under Japanese control. The various border states, Poland, Finland, Lithuania, Latvia, and Estonia, were still encouraged to wage incessant warfare with Russia and were utilized from time to time as bases for fomenting and launching additional counter-revolutionary movements; but with the withdrawal of active Allied military opposition, the Bolshevik Armies were enabled to deal more

effectively with these lesser opponents. Yudenitch was driven out of the Baltic area; Denikin was expelled from southern Russia and forced to take refuge in Constantinople; Admiral Kolchak, temporarily victorious in extending his anti-Bolshevist dictatorship from Siberia into eastern European Russia during 1919, sustained serious reverses in battle, was captured, and was executed in February, 1920.

The French, however, continued throughout 1920 to make trouble for Russia and incited the Poles to wage aggressive war (see POLAND) with the aid of the Ukrainians, and the counter-revolutionist, General Wrangel, Denikin's successor in southern Russia. It was of no avail. On Oct. 1, 1919, Estonia, Latvia, Lithuania, and Finland had united in proposing the negotiation of peace with Russia, and during the next year treaties were made between these states and the Bolshevik government. On Feb. 2, 1920, Russia and Estonia signed the Treaty of Dorpat providing for Estonian independence and for reciprocal commercial advantages. By the Treaty of Moscow, July 12, 1920, the independence of Lithuania was recognized. War with Latvia was terminated by the Treaty of Riga, Aug. 1, 1920, by which Russia acknowledged the independence of Latvia and her sovereignty over Livonia, Courland, and Latgallia. Finland signed a peace at Dorpat on Oct. 24, 1920, by which her independence was confirmed, boundaries adjusted to include the district of Petchenga in the north, and portions of Eastern Karelia assigned to Russia. Russia also endeavored to come to terms with the Poles, but it was not until after a series of defeats and victories on both sides resulted in a stalemate and the Treaty of Riga (Oct. 12, 1920, confirmed in final form, Mar. 18, 1921) that a settlement was finally achieved, stipulating Polish independence and the rectification of the eastern boundary of Poland. Meanwhile the Bolsheviks had successfully evicted General Wrangel from the Crimea and reconquered the Ukraine which was once more attached to Great Russia by a treaty signed Dec. 28, 1920, consolidating the administration of economic and military affairs in such fashion as to leave the Soviet government of the Ukraine with the merest shreds of independence in foreign affairs, agriculture, education, and justice. Other border peoples, also, which had temporarily broken away, were regained by the Moscow commissars, who interpreted their dogma of self-determination in such fashion as to permit armed assistance to Red factions in neighboring states. In the Caucasian republics of Azerbaijan and Armenia, Red troops helped to establish Soviet governments late in the year 1920, and in the following year, Georgia was sovietized. In December, 1922, these three republics were joined to form the autonomous Transcaucasian Socialist Federated Soviet Republic.

In Central Asia, Russian Turkestan was brought under firm control, and the Khanates of Khiva and Bokhara were transformed into Soviet republics despite the efforts of a brilliant Turk, Enver Pasha, to include them in a fantastic Pan-Turanian state (see PAN-TURANISM). These areas were also regrouped, in 1924, and the new autonomous republics of Uzbek and Turkoman formed.

Most of Siberia, after the fall of Kolchak, was reincorporated into Soviet Russia, and the short-lived Far Eastern Republic, in the eastern extremity of Siberia, returned to the fold in 1922.

The process of reintegration culminated in the signature of a treaty, Dec. 30, 1922, providing for the virtual federation of Soviet Russia, Soviet Ukraine, Soviet Transcaucasia, and the White Russian Soviet Republic. On the basis of this treaty, a new constitution was promulgated on July 6, 1923, establishing the "Alliance" or "Union of Socialist Soviet Republics."

The new constitution superseded the series of bilateral treaties by which the various areas had been bound to the Russian Republic until then, and naturally removed much of the administrative confusion which had existed prior to its adoption. In 1924 the republics of Uzbek and Turkoman became partners to the new constitution, so that from then on, the U. S. S. R. consisted of six autonomous soviet republics, each of which was guaranteed the right to withdraw from the union at any time. A unique form of government was provided for (see *Government*).

Despite perennial prophecies to the contrary, the Bolshevik government proved unexpectedly stable; it survived domestic insurrections, counter-revolutionary movements, and foreign intervention during the troubled years from 1918 to 1921; by 1924 it had attained a not inconsiderable measure of domestic support and foreign recognition; the year 1929 saw it on a firmer foundation than ever; but its leaders were unable to achieve either of their two major objectives: (1) the successful and complete communization of Russian society; (2) the precipitation and consummation of a world-wide proletarian revolution.

Aside from any inherent fallacies in Bolshevik doctrines (see BOLSHEVISM; COMMUNISM; SOCIALISM) and obvious technical limitations of Bolshevik leadership, there were many virtually insuperable obstacles to the achievement of communistic reforms in Russia. These embraced such factors as: (1) the almost universal ignorance of the lower classes, on whose intelligent and voluntary cooperation the success of such ventures largely depended; (2) the persistent hostility of dispossessed property-owners and of foreign capitalists; and (3) the agricultural, industrial, and commercial demoralization of Russian society resulting from the War and already manifest when the Bolsheviks seized power in November, 1917. The next four years saw confusion worse confounded.

Agrarian Situation.—The widespread prevalence of agrarian unrest and the peasants' passion for land had been potent factors in the subversion of the old régime. Approximately 85 per cent of the population of Russia was classed as rural, and the problem of adjusting the theories of the revolution to meet the interests of this great class was a source of much concern to the Soviet authorities. The land expropriation and redistribution which accompanied the Bolshevik *coup d'état* augmented the total land holdings of the peasantry from 70 per cent of the total cultivated acreage to 96 per cent in European Russia proper and from 55 per cent to 96 per cent in the Ukraine. In this process, not only were virtually all the large landed estates wiped out, but larger peasant holdings disappeared as well, so that by 1922 farms of 35.7 acres or less comprised 95 per cent of the total. The basic principle of the law of February, 1918, was the abolition of all private ownership of soil; all land was to be distributed on the basis of an "equalized land tenure" to indi-

viduals for cultivation. The individual holder became virtually an employee of the state; the produce, after a deduction of enough to meet his current requirements, became the property of the state. The great mass of peasants failed entirely to comprehend that this law confiscated their land as well as that of the erstwhile privileged classes. Conflicts between peasants and former urban workers and others who desired to benefit by the new policy led to a restatement of the land policy in a new law (February, 1919) which, while not prohibiting individual farmers, declared definitely in favor of "large Soviet estates, rural communes, group agriculture, and all other forms of collective use of land," and stated that "all forms of individual use of the land" were "merely temporary and doomed to disappearance."

In the years following the land-socialization policy, there was a marked decrease in the area under cultivation. This and other circumstances, notably crop failures, forced the Government to take two highly important steps in the reversal of that policy. First, in the spring of 1921, the principle that the entire produce of the farmer belonged to the state was virtually abandoned. All peasants who paid a fixed tax in kind were given the right to dispose of any surplus as they pleased. In the second place, in the spring of 1921, the fundamental law of land possession was completely revised. While it reiterated the basic principle that "the land belongs to the state" and repeated the prohibition against the purchase, sale, and mortgage of land, it completely abandoned the idea that "all forms of individual use of the land should be regarded as merely temporary and doomed to disappearance." The peasants were given not the technical ownership but the actual possession of the land. The old village communities were allowed to continue their practice of permanent group possession with periodical repartition to members for actual use, but at the same time the individual peasant family was to be permitted to break away from these communities and to acquire direct possession, perpetual and hereditary.

The new law was thus almost identical in principle with Stolypin's agrarian measures of 1907 and 1910. In short, it was a distinct recognition of the individualistic tendencies of the mass of the peasants, coupled with a continued attempt to guard against any return to economic inequality in land possession. A new system of graduated land taxation helped toward the same end of maintaining social equilibrium. Agriculture constituted the one line of production in Russia where human enterprise was practically unaffected by the communist régime from the start. Indeed, after 10 years of Bolshevik rule, 90 per cent of all agricultural output which went to market was produced by private peasant proprietors, while the state-owned farms and agricultural cooperatives combined produced only 10 per cent. By 1923 Russian agricultural production aggregated 75 per cent of the pre-war average. A poor harvest in 1924 was succeeded by four good crop years, and the total sown area in 1928 (over 260,000,000 acres) was almost equal to the pre-war sown area. It was estimated that the agricultural output for 1928 would equal 104 per cent of that of 1913. Given a little more freedom in the matter of the export of their surplus, the peasant would doubtless attain greater prosperity

than he ever had in the days before the War.

Industrial Situation.—Industrially, Russia in 1917 had been severely strained by the War. The breakdown of the railways and shipping not only interrupted trade and deprived the peasants of implements and supplies but prevented the shipping of foodstuffs to the industrial cities. Here, the expropriation of factory owners and the prohibition of trade completely dislocated the normal economic relations of society, for the workmen proved too ignorant to operate the great industries without technical assistance. "Industrial production dropped to the lowest ebb, due to the system of management by workmen's committees, lack of incentive for human endeavor, the scheme of universal state maintenance of the working classes, equalization of all working personnel, irrespective of the degree of responsibility or nature of work performed." Various measures for stimulating production by all kinds of premiums and penalties were utilized and discarded in turn. The dwindling of available reserves of materials and productive equipment, and the menacing diminution of agricultural acreage noted above threatened the proletariat with starvation, and menacing strikes occurred in Petrograd, Moscow, and other cities during the winter of 1920-21. The Soviet government was compelled to modify the application of its communistic policies. Technical experts and managers were restored to their positions at relatively high salaries. Trading in commodities, at first prohibited, then winked at, became openly tolerated, and was finally legalized in May, 1921.

The "New Economic Policy."—On April 7 of the same year, the original plan of complete state confiscation of all industrial products was modified to permit industrial enterprises to allocate a certain portion of their output to workmen as wages and premiums, the workmen in turn being free to dispose of these products in the open market. This was the beginning of the so-called "New Economic Policy" (N.E.P.), characterized by Lenin as a "strategic retreat," which marked the gradual abandonment of communism through the successive phases of collectivism and state socialism to a system of quasi state capitalism. Under the new system, nearly all the basic industries were organized into several hundred state trusts and syndicates, chartered "on a commercial basis with the aim of acquiring profits" (by a decree of Apr. 10, 1923).

A governmental cabinet department which was known as the Supreme Economic Council was to control these trusts in the matters of prices, fixed capital, and the appointment of managing boards. Except in these respects, the trusts were legally independent and responsible, and accountable to the state for only about 50 per cent of their profits. Ten per cent of the profits were to go for the welfare of the workers, thus providing the necessary economic incentive to better work, and the balance was to go to the surplus fund of the trusts for further expansion and reserves. Whenever desirable, the Government could use the money received from one trust to subsidize another.

Further, private initiative was admitted by leases of less essential enterprises and by concessions and participation in mixed companies, in which, however, the controlling interest was to be held by the state. The principal banks continued under government control, and foreign

trade remained a government monopoly. Labor armies and compulsory labor in general were abolished, as well as all forms of rationing. The ordinary system of employment and wage-earning was restored, with the interference of trade-union and factory committees in the management of works reduced to a minimum.

Distribution could take place through any one of five agencies: State or syndical wholesale and retail establishments, coöperative retail stores, private retail stores, rural fairs, and the government export bureau. The approximate turnover in wholesale and retail internal trade in 1926 was 49 per cent through the state's agencies, 30 per cent through coöperatives, and 21 per cent through private trade. By 1922 Russian industry reached 22 per cent of pre-war production, a measurable increase over previous years; in 1923 the figure had increased to 35 per cent, and in 1924 to 45 per cent. In 1927 it was estimated that the total industrial output for 1928 would equal 124 per cent of that of 1913.

Meanwhile, further changes in policy were taking place. A State Planning Commission, the Gosplan, was established in 1923 to coordinate all phases of industry, and to outline a general economic programme for the next 5 to 15 years. It was the Commission's task to "integrate in detail the economic life of 150 millions of people over a 6000 mile stretch of territory." Its chief objectives were to bring Russia's economic output up to the pre-war level as quickly as possible, and then to make Russia as nearly self-sufficient as practicable. In 1927 the Gosplan was headed by an expert governing board of 16, with a central of 500 assistants. "No major step in industry could be taken without the visa of the Gosplan." After spending years in the compilation and study of statistics, the Gosplan, in the spring of 1927, published in a 300-page book a plan upon which industry was to operate for the next five years. It was a daring experiment and bore watching on the part of the rest of the world.

In 1925 restrictions on private trade were further ameliorated, and the taxes on private trade lowered. Despite these changes, and despite the fact that credit was made easier, private industrial trading began to decrease in 1926 and 1927 because of the increasing competition of the coöperatives. In this respect, industrial conditions were quite different from agricultural ones. A further decree, of April, 1925, permitted farmers to employ hired labor under a regular wage system, and to extend the legal eight-hour working day during the busy seasons. On the other hand, a decree of November, 1927, provided for the gradual introduction of the seven-hour day into industry.

The year 1928 brought with it greater liberality in the matter of autonomy for factory managements, and in September of the same year, the Government announced "a programme of extension and liberalization of the policy of granting concessions to foreigners. The new policy included the importation of construction materials duty free and simplification of the taxing scheme." Concessions to foreigners were granted in such fields as mining, the manufacture of machinery and artificial silk, cotton growing, and leather tanning. On June 1, 1928, there were 97 foreign concessions in operation, 14 of these being controlled by Americans. Incidentally, the W. A. Harriman Company, in Sep-

tember, 1928, surrendered as unprofitable a concession, acquired in 1925, to exploit the manganese fields of Chiaturi. A Soviet trust took over the venture, and in 1929 came to an agreement with the United States Steel Corporation whereby the latter contracted to purchase from 80,000 to 150,000 long tons of manganese a year for five years. Another change of Soviet policy occurred on Oct. 4, 1925, when prohibition was repealed and the distilling of 40 per cent vodka made a government monopoly.

These compromise policies inaugurated by Lenin and his more moderate associates naturally had a stimulating effect upon industry and foreign and domestic trade, but they were vigorously assailed by the Communists of the extreme left wing, and there was much dissension in party councils. The personality, intellect, and will power of Lenin, however, overbore all opposition, and even during his prolonged illness in 1922 and 1923, his policies prevailed; but following his death on Jan. 21, 1924, the Communist Party was definitely split over the question of a successor. At first, a triumvirate consisting of Joseph Stalin, Kamenev, and Zinoviev assumed control, but by 1925 Stalin emerged as the sole head of the Communist Party, and therefore as virtual Dictator of Russia. Kamenev, Zinoviev, and Lenin's old friend, Trotsky, formed a sort of opposition group. Their chief points of difference resulted from Stalin's plan to improve relations both with the foreign world and with the peasants, while Trotsky still wanted a world revolution and the exclusion of foreign capital. Soon Zinoviev and Trotsky were expelled from the party, and in 1927 and 1928, respectively, they were exiled. The specific charge against Trotsky was the illegal organization of an opposition party. Stalin's dominance meant the continuation and extension of the N.E.P.

The Communist Party, Education, and Religion. The foundation of the Russian government was the Communist or Bolshevik Party, which, by 1929, had about 800,000 active members—mostly veteran revolutionists or their trained disciples. With no special privileges to compensate them, these Communists had always to be at the disposal of the Government, had to devote their spare time to preaching the doctrines of their political faith, had to be ready to defend the system with their lives, and were subject to severe penalties for infractions of the rigid rules established. Annual "purifications" purged the party of lukewarm or recalcitrant members. Additional members were recruited from a list of "candidates" (numbering between 300,000 and 400,000 in 1928) who were graduates of the Komsomol or Communist Youth Organization. This organization had about 2,000,000 members who were between the ages of 16 and 23 years in 1929.

Below the Komsomol was the Pioneers or Communist Children's Organization, with a membership of 2,000,000 children between 10 and 16. Numerous constitutional and extra-constitutional means were employed to keep the party in absolute control of the Government. (1) The disfranchisement of all whose interests might make them possible counter-revolutionists. (2) The according of a greater proportionate representation to the urban districts than to the rural districts. (3) The employment of indirect rather than direct methods of election to the national Congress. (4) The reservation of all important governmental positions for members of the Com-

munist Party. (5) A strict censorship of anti-Bolshevik speech and press, and frequent resort to imprisonment for political offenses; indeed, in 1918 the Cheka, a special police instrument of Red Terror, was established. After having put to death thousands of political opponents of Communism, the Cheka was abolished in 1922, though arrests and executions continued. (6) The prohibition of the organization of any opposition party. (7) The excellent organization and direction of the Communist Party itself. At its head were a secretary general (first Lenin, then Stalin) and a Political Bureau, or Politburo, which absolutely governed the entirety of the party membership.

Realizing that the ignorance of the masses was one of the greatest obstacles both to an improvement in the country's prosperity, and to the spreading of their doctrines, the Communists determined to make every possible attempt to educate the people in general, and simultaneously to impress upon them the soundness of socialistic principles. Lack of money prevented the carrying out of an extensive educational programme anywhere but in the large cities. Many villages remained without any schools whatever. Adult education in the cities was provided for by a sort of university extension system.

The first decade of Bolshevik rule was also marked by bitter controversies over religious teaching in the schools, the confiscation of church property, the attempts of the Government to encourage the "Living Church" movement, and the trials and executions of various prominent prelates, both Russian Orthodox and Roman Catholic, on charges of treason. There was a marked tendency toward the abandonment of Christianity on the part of such Bolsheviks as were not Jews, and toward the substitution of somewhat bizarre Communist ceremonies for the Christian ritual of baptism and death; marriage became a civil contract, readily dissolved by mutual consent, but not more than three divorces were permitted to the same person in any one year.

In the spring of 1922, a Soviet decree requisitioned whatever church treasures remained, on the ground that they were to be used for famine relief work. The decree inaugurated a new wave of religious persecution during which several hundred priests were arrested, and many others shot. The Patriarch of the Orthodox Church, Tikhon, was imprisoned in a monastery in Moscow. The religiosity of the Russian peasants, however, was so great that the Government decided to bore from within by lending support to a group of Communist priests who urged a series of radical reforms. Early in 1923, this group called a conference of members of the Orthodox clergy and laity, and in solemn session deposed Patriarch Tikhon as a counter-revolutionary. Despite this, Tikhon was released by the Government, and until his death on Apr. 7, 1925, a majority of the church members continued to look up to him as Patriarch. His successor, the Metropolitan Peter, was also arrested, but finally, in the summer of 1927, Metropolitan Serge, the former Keeper of the Patriarchal Throne, concluded an agreement with the governmental authorities and announced his loyalty to the Soviet State. Nevertheless, religious conditions were still in a state of uncertainty and turmoil in 1929. Churches could be leased from the state without charge by any group of not less than 20 members of a con-

gregation. No religion could be taught in state or private schools, but instruction might be given the children at home if the parents so desired. Religious classes might be organized for persons above the age of 18.

Foreign Relations. At the outset, the Bolshevik doctrinaires eschewed imperialism as a phase of the capitalism they sought to destroy, and true to the tenets of their creed, they renounced the concessions and privileges acquired by pre-revolutionary Russian governments in Turkey, Persia, Manchuria, and Mongolia. This anti-imperialist policy, at first manifested chiefly in negative form, soon assumed the positive aspect of a vigorous and widespread attempt to arouse the Asiatic races against Anglo-French domination and "exploitation." Afghanistan was incited by Bolshevik propaganda and encouraged by a Russian alliance to make war on the British Empire and to emancipate itself from British tutelage. With the Nationalist government of Turkey, the Moscow anti-imperialists likewise negotiated an alliance against European imperialism, but in this case, the interests of the Allies were not sufficiently harmonious to make the treaty an effective force; the divergence of aims was seen most clearly at the Lausanne Conference (see *PEACE CONFERENCE AND TREATIES*), when the Turks showed themselves willing to compromise with Western Europe regarding the freedom of the Straits, while the Russians, anxious to exclude British and French warships from the Black Sea, held out for the absolute closure of the Straits to vessels of war.

After long negotiations, the Russian government concluded two agreements with China on May 31, 1924, concerning the Chinese Eastern Railway in Manchuria and other disputed matters. Russia gave up all special rights, privileges, and concessions that the Czarist government had secured from China prior to 1917, but the Chinese Eastern Railway was to continue under joint Sino-Russian control (see also below). The value of such diplomatic gestures as means of emphasizing Russia's self-appointed rôle of antagonist to European imperialism was enhanced by the propagandist activities of the Third International, theoretically a federation of Communist parties of all countries, but actually a propagandist organization, officered by leading members of the Russian government, dominated by the Russian Communist Party, and adhered to by only an insignificant minority of Socialists outside Russia. This organization was formed in 1919 with Zinoviev at its head for the purpose of preparing the ground for the heralded world revolution. In 1926 Zinoviev was succeeded by Bukharin.

The Third International directed its inflammatory agitation both toward the subject peoples of Asia, and toward the capitalistic nations of the West. The latter phase of its activity was particularly offensive to the United States government, the former to Great Britain. On more than one occasion, the propagandist activities of the International made it exceedingly difficult for the Russian government to carry on friendly negotiations with other countries.

The vigor shown by the Bolshevik government in suppressing counter-revolutionary movements and in reintegrating at least part of the old Russian Empire wrought a radical change in the attitude of the Western Powers. Post-war Europe needed commerce, and the British in

particular were manifesting serious concern about the necessity of restoring normal economic life in central and eastern Europe to provide sources of food and raw materials and markets for British manufactured goods. They were also anxious to diminish or eliminate causes of friction with the Bolsheviks, so as to prevent trouble in Persia, Afghanistan, and India. These considerations did not operate with equal force in the case of France, Japan, and the United States. The French, mindful of the 26,000,000,000-franc debt which the Bolsheviks had repudiated, steadfastly refused to countenance any recognition of Soviet Russia. The United States firmly refused to recognize the Soviet government as representing the Russian popular will. Japan sought to profit by the temporary eclipse of her neighbor to enhance her interests in Siberia. On Jan. 16, 1920, the Supreme Council at Paris announced the lifting of the blockade around Russia and the prospective reestablishment of trade relations, although Allied statesmen were at one in emphatically repudiating any desire or intention of recognizing the Bolshevik dictatorship. During the remainder of 1920, the British, despite French opposition and the complications resulting from the Russo-Polish War, carried on negotiations for a trade agreement. Questions of propaganda and of Soviet policy in Asia were also subjects of acrimonious correspondence (See PERSIA; AFGHANISTAN; TURKESTAN; etc.) Finally, on Mar. 16, 1920, a trade agreement was signed, involving the *de facto* recognition of Russia, the removal of all hindrances to a resumption of economic relations, the mutual abandonment of propaganda against the institutions of the respective signatories, etc. On this agreement as a prototype were modeled numerous agreements with other countries from 1921 to 1924. Germany signed an agreement on May 6, 1921; Norway, Sept. 2, 1921; Austria, Dec. 7, 1921; Sweden, Mar. 9, 1922 (failed of ratification); Italy, May 29, 1922 (also failed of ratification); Czechoslovakia, June 5, 1922; and Denmark, Apr. 24, 1923.

The problem of Russia proved the storm centre at the important Genoa Conference (Apr. 10–May 14, 1922). Russia desired complete recognition and an Allied loan, but the French continued to insist that Russia should respect the rights of private property and recognize her past debts. The sole tangible result of the conference was the signing of the Russo-German Treaty of Rapallo, providing for mutual cancellation of debts and war claims, which still further infuriated the French. The year following, Genoa saw little headway made in the reacceptance of Russia into the family of nations, but late in 1923 and early in 1924, its prospects visibly brightened. *De jure* recognition was gained from Poland in December, 1923; from the Labor government of Macdonald in Great Britain, Feb. 1, 1924; from Austria, Norway, and Italy in February; and from Sweden and Greece in March.

Within the next few years, most of the other important countries of the world, except the United States, followed suit. France, under the influence of the Socialist Herriot government, accorded recognition on Oct. 28, 1924. On Apr. 26, 1926, Germany and Russia concluded another treaty whereby Germany promised to remain friendly to Russia in the face of any coalition, apparently even League coali-

tion formed to boycott Russia economically.

Anglo-Russian relations, however, did not continue amicable for long. The publication in 1924 of the famous Zinoviev letter which purported to show that the British Labor Party and the Third International were working in harmony, the arrest in October, 1925, of some British Communist leaders in London and the resultant discovery of definite links between the British and Russian Communists, and the Russian subsidy of the striking miners in the British coal strike of 1926 all led to the break which occurred in May, 1927. After a raid of the Soviet trading headquarters (Arcos, Ltd.) in London on May 12, the British government on May 24, 1927, once again broke off relations with Russia on the ground that, contrary to the agreement of 1921, the Soviets were carrying on subversive activities in England. This time, however, the other countries did not follow England's lead, so that England and the United States remained the two important countries that refused diplomatic recognition.

So far as its relations with the League of Nations went, Russia at first disregarded it completely, as another capitalist stronghold. But from 1922 on, Russia participated in a number of League economic and disarmament conferences. Its most spectacular participation came in April, 1928, when the Russian delegate to Geneva, Litvinov, urged the abolition of all armies and navies throughout the world. The Germans were sympathetic to this attitude, but the viewpoint of the former Allied powers was presented by Lord Cushendun of England, who charged Russia with proposing the scheme so as to make it easier for the Third International to spread its Communist propaganda throughout the world. And there the matter rested, with Russia remaining as one of the two great nations still outside the League. On Aug. 19, 1928, however, the Soviet government signed and ratified the Kellogg Pact.

With the rise to power of Chiang Kai-shek in China, Bolshevik influence there began to decline. Beginning with 1927, the Chinese Nationalist government definitely abandoned its former policy of cooperation with the Bolsheviks and began to suppress Communism wherever it raised its head. On Apr. 6, 1927, Chinese officials raided the Russian Embassy in Peking, claiming that it was being used as a headquarters for propaganda. Only the determination of Stalin to avoid an open break kept the peace between the two countries at the time. Then, on May 27, 1929, some Chinese raided the Russian Consulate General at Harbin. The Chinese Minister of Foreign Affairs, Dr. C. T. Wang, denied that the Nationalist Government was connected with the raid, but while the matter was under investigation, the Chinese officials in Harbin on July 10 arrested some, and deported other, Russian officials and employees of the Chinese Eastern Railway, again on the ground of Communist propaganda. On July 18, Russia recalled her consular and commercial representatives from China, and throughout the rest of the month and August, negotiations continued with both sides protesting their desire for a peaceful solution of the dispute. An aggravating series of border incidents complicated the parleys, and both sides mobilized troops along the frontier.

Meanwhile, other powers, especially the United States and Germany, were trying to mediate

and to recall to the mind of the disputants the fact that both had signed the Kellogg Pact in the previous fall.

Bibliography. The best summary of the state of affairs in Russia after 10 years of Bolshevik rule was presented in *Soviet Russia in the Second Decade*, edited by Chase, Dunn, and Tugwell (New York, 1928).

RUSSIAN LITERATURE. In its early stages, the World War had little effect upon Russian literature. This had always maintained an independent attitude toward the Government, if not actually a hostile opposition to everything that was undertaken by the officials, and many writers became frankly defeatists at the outbreak of the great struggle. Andreyev, with his play translated as *The Sorrow of Belgium*, is perhaps the chief author who expressed himself as in sympathy with the conflict in which his nation was engaged.

With the outbreak of the Revolution in 1917, and its completion by the accession to power of the Communists in October of the same year, there came a very sharp break in the continuity of Russian literature. The better-known authors who followed in the tradition of Chekhov, as Kuprin, Bunin, and their friends, went abroad. They have written copiously, but very little of their work seems destined to survive. They have written largely of the past life in a form that is a treatment neither of contemporary subjects nor of historical matter and they leave a curious effect upon the reader, as if they were writing of a dream world which is not and never can be again. They are at their best where they deal with foreign or remote periods, as Meizhikovsky in *The Birth of the Gods* (Tutankhamen in Crete), Grebenshchikov in *Churayevy* (the study of Russian sectarians in Siberia), or Aldanov in his trilogy on the French Revolution.

Of distinctively war books, we may mention Andreyev's journalistic *S. O. S.*, an appeal to the Allies against the Bolsheviks, and the writings of Ataman Krasnov. His novel, *From the Two-headed Eagle to the Bolsheviks*, is a typical "White" novel, which outlines the crimes of the new Government. It is frankly propaganda, but, especially in the battle scenes, it is of real value. The same is true of *The Road to Calvary*, by Count Alexis N. Tolstoy, where there is a lurid description of Petersburg on the very eve of the War.

When we pass to the literature within Russia, we find a very different situation. Conditions became steadily worse after 1918 and Maxim Gorky played a most important rôle in interceding with the Government on behalf of the starving writers. He has continued his literary autobiography in *Among People* and *My Universities* and these works are far more interesting than any of his new fiction.

The outstanding poet of the time in Russia was Alexander Blok, who died in 1921. *The Twelve* describes the progress of a revolutionary patrol through the streets of Petrograd on a stormy night, and as they move along, they are led invisibly by Christ, who passes on ahead without regard to the shots and the chaos. The

poem sums up all of Blok's earlier work and is easily the greatest product of the revolution. *The Scythians* is another of his poems which is a challenge to western Europe and stresses the gulf that separates Russia from both Europe and Asia.

Among other outstanding poets of the period, may be mentioned Ana Akhmatova, a singer of love, Vyacheslav Ivanov, Pasternak, and Erenburg. We have also the peasant poetry of Klyuyev and Yesenin. Nikolay Klyuyev stressed the Russian popular traditions in his work and even turned Lenin into a peasant saint. Sergey Yesenin, for a while the husband of Isadora Duncan, was a poet of real talent, but he could never orient himself in the seething world around him and ultimately committed suicide in 1925, leaving behind him a collection of poems both vulgar and pious that reveal the struggle that went on in his soul. Vladimir Mayakovsky swung the entire Futuristic movement into a support of the Soviet government and for a while became almost the poet laureate of the movement, but his popularity soon broke with the authorities. We may mention also Denyan Bedny, as a representative of the proletarian poets, but few of these have accomplished anything of importance.

With 1922 prose literature in Russia began to revive, at first haltingly, but with ever more power until it came again to seize the leadership from poetry. In much of this, especially at the beginning, narration was subordinate to description. This was due to the influence of Remizov and Byely, who had developed this style before the War. Among the writers who took part in this movement, we must stress the rôle of Evgeny Zamyatin, who had much to do with training the younger writers during the revolutionary period. Then came the Serapion Brothers, a group of various tendencies which was formed in Petrograd and attracted much attention. Leo Lunts, who died in 1924, was among this group. Perhaps the outstanding member of this group is Vsevolod Ivanov, an adventurer and a self-taught man. Naturally, he is a master in scenes of action rather than of thought, and such stories as *The Child* are most effective in giving an example of the psychology of the Red Armies.

Here belongs also Boris Pilnyak (Boris Andreyevich Wogau), with his novels *The Bare Year* and *Ivan-da-Maria*. These novels follow Remizov and Byely in not telling a story directly, but they contain many scenes of sweeping interest and reveal many of the types of the revolution, attractive and the reverse.

With the growing establishment of order, we find the strengthening of prose and perhaps the master is I. Babel, a man of Jewish origin who was associated with the cavalry leader, Budenny, and who in his *Konarmia* (*The Cavalry Army*), has given realistic and surprising pictures of the civil war in Russia, without glossing over any scenes of horror and bloodshed. Babel has been highly regarded by the Soviet authorities and ranks perhaps as the leading author of the present day.

Among others, we may mention Konstantin Fedin (*Cities and Years*). Here we have a contrast between the old intelligentsia, who are unable to act, and the new order of life, which demands courage and efficiency and loyalty. The same is found in *Cement*, by Gladkov, where a peasant by his sheer energy and determination

succeeds in putting a factory into working order, and is contrasted with the inefficient talk of many of the educated class. This is characteristic of much of the new literature which has freed itself from the glorification of weakness which was so depressing in the pre-war writers.

Many of these writers are not fully convinced Communists, but are called rather *Poputchiki*, or Companions. Their writings and success bring up certain controversies and, particularly in literary criticism, there are many schools of Marxists, formalists, and others discussing the theories and nature of literature and their connection with the Soviet State.

The drama has continued to develop. There are still the Moscow Art Theatre, the Studios attached to it, the theatre of Evreinov, and others. In general, the Russian theatre is in a high state of prosperity and is developing on many novel and original lines.

In conclusion, it may be said that there is the general impression that Russian literature has survived the chaos of the War and is now definitely launched on a new period, but it is still too early to know how much of the older tradition will be taken over into the new structure.

RUSSIAN SOCIALIST FEDERATED SOVIET REPUBLIC. See RUSSIA.

RUST OF WHEAT. See PLANTS, DISEASES OF.

RUTGERS UNIVERSITY. A nonsectarian institution at New Brunswick, N. J., founded in 1766. The student enrollment in 1914 was 850, as compared with 3972 in the fall of 1928. In 1918 the trustees established the New Jersey College for Women as an affiliated institution, not coeducational, in the fall of 1928, it had 1082 undergraduates included in the university's registration above. The faculty of Rutgers increased during the period 1914-28 from 55 to 235 members and the library from 76,643 to 172,100 volumes. In 1916 the university celebrated the one hundred and fiftieth anniversary of its founding as Queen's College by Charter from George III of England. In 1928 the endowment amounted to \$3,854,823 and the total income to \$2,353,880. Total assets were valued at more than \$12,000,000. The John Howard Ford Dormitory was built and furnished in 1914. A ceramics building and several buildings for the Agricultural College were erected. The State College for the Benefit of Agriculture and the Mechanic Arts, maintained by the Trustees of Rutgers, was designed by the Legislature as the State University of New Jersey in 1917. In 1925 the Voorhees Memorial Chapel, a recitation building for the Women's College, the Hegeman Dormitory and a physics building were erected; in 1928 a music building was built for the Women's College. President, John M. Thomas, D.D., Litt.D., LL.D.

RUTH, GEORGE HERMAN (1894-). Professional baseball player, known to all fandom as the "Babe," born at Baltimore, Md. He joined the Baltimore International League Club in 1914 and was sold to the Boston Club of the American League in 1915. He was bought by the New York American League Club in 1920 for \$150,000, the largest sum ever paid for a ball player. As a member of this club, he established a world's record by knocking out 59 home runs during the season of 1921 and for his all-around work in 1923 was voted the most valuable player in the American League. In 1927, after knocking out 60 home runs, he signed

a three-year contract with the "Yankees" at a salary of \$70,000 a year. He published *Babe Ruth's Own Book of Baseball* (1928).

RUTHENIA. See CZECHOSLOVAKIA; GALICIA, EAST.

RUTHERFORD, SIR ERNEST (1871-). A British physicist (see VOL. XX). He was Cavendish professor of experimental physics and director of the Cavendish Laboratory at Cambridge University (1919-) and professor of natural philosophy at the Royal Institution. He was made an honorary fellow of Trinity College, Cambridge (1919), was president of the British Association for Science (1923), and of the Royal Society (1925), and received the Order of Merit (1925), the Copely (1922), and Franklin (1924) medals. His later work was concerned with the structure of the atomic nucleus. See PHYSICS.

RUTHERSTON, ALBERT DANIEL (1881-). A British painter, born in Bradford, Yorkshire. He attended the Slade School in London, where he won the Figure Competition Prize with "Confession of Claude." At first, he followed the realistic impressionism of the time, examples of this period being "La Vente au Poulets" and "The Brook." Then he began the use of water colors, and slowly developed his linear style of a pencil or ink line, and a water color or gouache wash. This method, perfected by 1913, was reminiscent of the calligraphy and feeling of Chinese and Persian art. Besides his ordinary work, much of which was done on silk, he was an illustrator and a designer of wall papers and decorations for the stage. Typical illustrations of his work are "The Garden of Eden" (1910); "Chloe" (1919); "The Entrance to the Quarries at Beer" (1921), and "Winter" (1924). In the latter year, he began etching for the first time. Galleries where he is represented include the British Museum, Victoria and Albert Museum, Dresden, and the Imperial War Museum. He was editor of *The Contemporary British Artists* series, and published *Decoration in the Art of the Theatre*, and *Memoir of Claud Lovat Fraser* (with John Drinkwater, 1923). Consult *Arthur Rutherford*, by Reginald Morier Yorke Gladowe (1925).

RUTHVEN, ALEXANDER G(RANT) (1882-). An American zoölogist, born at Hull, Iowa, and educated at Morningside College and the University of Michigan. He was instructor in zoölogy and curator of the museum (1906-12), and professor of zoölogy and director of the museum (1911-) at the University of Michigan. From 1927 to 1929 he was chairman of the department of zoölogy and director of the zoölogical laboratories there. In the latter year he was named president of the university to succeed Dr. Clarence Cook Little. His publications were on the reptilia, and he collaborated with Schull and La Rue in *Principles of Animal Biology* (1920).

RYAN, HARRIS JOSEPH (1866-). An American electrical engineer, born at Powell's Valley, Pa., and educated at Cornell University. He became an instructor in physics and professor of electrical engineering at the university from 1888 to 1905 when he accepted a call to a similar professorship at Stanford University. During the World War, he was director of the anti-submarine laboratory of the National Research Council at Pasadena, Calif. He gave much attention to methods for electrical-engineering tests and measurement, the laws governing

relation of size and separation of conduction; and electric pressure at which corona and power waste appear in high-pressure power transmission lines. He is a member of the National Academy of Sciences and numerous other learned societies. In addition to many papers and monographs on electrical subjects variously contributed, he wrote *Textbook of Electrical Machinery* in collaboration with H. H. Norris and G. L. Hoxie.

RYAN, JAMES HUGH (1886-). A Roman Catholic clergyman, rector of the Catholic University of America. Born in Indianapolis, Ind., he was educated in parochial schools there, and at Duquesne University, Pittsburgh; Mt. St. Mary's Theological Seminary, Cincinnati; and the American College, Rome. He received the degrees of Ph.D. from the Roman Academy (1908); S.T.D., University of Propaganda, Rome (1909), and LL.D. (honorary), Marquette University (1929). Ordained to the priesthood at Rome in 1909, he was instructor of psychology at St. Mary-of-the-Woods College, Indiana (1911-21); and instructor (1922-26), associate professor (1926-28), and professor (1928-29) of philosophy at the Catholic University of America. In 1928 he was appointed rector of that institution. He was also executive secretary of the National Catholic Welfare Council (1920-28), Domestic Prelate to the Pope (1927), and Protonotary Apostolic (1929). His publications include *A Catechism of Catholic Education* (1922); *An Introduction to Philosophy* (1924); *The Encyclicals of Pius XI* (1927). Since 1927 he has been editor of *The New Scholasticism*.

RYAN, JOHN AUGUSTINE (1869-). An American theologian and sociologist. He was born in Dakota County, Minn., studied at St. Thomas Seminary, St. Paul, Minn., and at St. Paul Seminary, and was ordained to the Roman Catholic priesthood in 1898. After four years of graduate study at the Catholic University, Washington, D. C., he became professor of moral theology and economics at St. Paul Seminary, where he remained 13 years. Since 1915 he has

held the chair of moral theology and industrial ethics at the Catholic University. He is director of the Social Action Department of the National Catholic Welfare Council. He wrote *A Living Wage* (1906); *Alleged Socialism of the Church Fathers* (1913); *Distributive Justice* (1916); *The Church and Socialism* (1919); *Social Reconstruction* (1920); *The Church and Labor* (1920); *The State and the Church* (1922); *Declining Liberty* (1927).

RYAN, JOHN DENIS (1864-). An American capitalist, born in Michigan. He was a director and official in the Anaconda Copper Mining Company and other important mining companies and in 1918 was appointed director of aircraft production by President Wilson. In the same year, he served as second Assistant Secretary of War and director of the Air Service. He was also a member of the war council of the American Red Cross and later became a member of the Red Cross central committee.

RYKOV, ALEXEY IVANOVITCH (1881-). A Russian Soviet public official born at Saratov, the son of a peasant, and educated at the University of Kazan, where he studied engineering. He was many times jailed for political reasons. In 1903, while studying economics at Geneva, he met Lenin, and from that time the two were close friends. Rykov led the revolt of 1905 so successfully that he was elected to the central committee of the Social Democratic Labor Party. In the first Bolshevik cabinet, he was People's Commissar for the Interior; later, he was head of the Supreme Council of National Economy. He was first vice president of the Council of People's Commissars of Russia and was virtually Premier during the illness of Lenin, on whose death he became president of both the Union of Socialist Soviet Republics and the Russian Socialist Federated Soviet Republics. Among his first acts as Premier was the order of an issue of silver coins to provide small change for the peasants and the formulation of plans for a better working relationship between the farmers and the industrial workers. He wrote much in the field of economics.

S

SAAR (zär) BASIN. A region created by the Peace Conference, contiguous to the northeast boundary of France. Area, 738 square miles, population in 1910, 649,509; in 1926, 773,764, of whom 125,800 were in the town of Saarbrücken. The inhabitants before 1919 were entirely German, except for some 3000 French. The basin, a continuation of the great Lorraine coal field, was drawn to coincide with the mines and their dependent industries, as well as with the limits of the coal deposit. In 1912-13 coal produced amounted to 17,473,000 tons (6 per cent of the total German output, though 40 per cent as great as the total French); steel produced, 2,080,000 tons. Glass and pottery works came next in importance. There were 72,700 miners employed, and some 50,000 other industrial workers. In 1920, 9,198,714 tons of coal were produced, and in 1927, 13,600,000 tons, including the privately owned Frankenholz mine. Pig iron totaling 1,936,184 metric tons and crude steel totaling 2,073,051 metric tons were produced in the Saar in 1928. This was an increase of 9 per cent over the 1927 output for both metals and an increase in pig iron productions over that for 1913 of 41 per cent. The total production of fabricated steel by Saar mills in 1928 was 1,621,661 tons.

The final disposition of the Basin hinges on the successful culmination of the struggle between the principles of annexation and reparation. On the score of historical and ethnographical rights, French claims for outright annexation were of course lamentably weak, while strategically, there could be no reason for the cession in the light of the forced demilitarization of the left bank of the Rhine, but as compensation for the willful destruction of French coal mines at Lens and Valenciennes, there was every ground for serious consideration of the French position. The final solution, as embodied in Articles 45-50 of the Treaty, was to turn over to the French in absolute ownership all the coal deposits of the territory, the value of the mines to be credited to the German reparation account; to give the French the right to improve the existing systems of communication, or to create new ones; to employ French currency; and to incorporate the area in the French customs régime.

To avoid the indignation which would have been evoked by outright French annexation of the territory, the Peace Conference made the Saar Basin a separate state, to be administered by an international governing commission of five members, representing the League of Nations. These were to be named by the League Council for one year. The commission was to have full sovereign rights including those of levying taxes and dues. Before modifications of the law or new taxes, except customs, could be effected, the commission had to consult elected representatives of the population. This was, however, to be a temporary expedient. For the ultimate determination of the Basin's status, a

plebiscite in 15 years (1935) was provided for by the Treaty. Then, every person of over 20 years who had been a resident in 1919 was to have the right to vote for one of three possibilities: the international status in force at the time, union with France, or union with Germany. In the event of the reestablishment of German sovereignty, the mines were to be repurchased by Germany.

On Jan. 10, 1920, the League of Nations took control, after a period of military occupation; eight days later, the French took over the mines. One of the first acts of the commission was the extension of the free customs union between the Saar and Germany for five years.

SAARINEN. GOTTLIEB ELLIEL (1873-). A Finnish architect, born in Kantasalmi. As architect for the railway stations in Helsingfors and Wiborg and for the city halls in Lahti and Joensuu, Finland, he acquired an international reputation which was furthered by his design of a plan for Sofia, Bulgaria, and structures in other European countries, the United States, and Australia. The Cranbrook School at Cranbrook, Mich. is a notable example of his work.

SABATINI, RAFAEL (1875-). An Italian author and dramatist. Born at Jesi, he settled in England after being educated in Switzerland and Portugal. He wrote many exciting highly colored romances dealing with various critical periods of history. Several of his books, notably *Scaramouche* and *The Sea Hawk*, were made into highly successful motion-pictures. His writings include: *The Tavern Knight* (1904); *The Lion's Skin* (1911); *The Life of Cesare Borgia*, a history (1912); *Torquemada and the Spanish Inquisition*, a history (1913); *The Gates of Doom* (1914); *The Sea Hawk* (1915); *The Snare* (1917); *Scaramouche* (1921); *Captain Blood* (1922); *Fortune's Fool* (1923); *The Carolman* (1925); *Bellarion* (1926); *The Nuptials of Corbal* (1927), and *The Hounds of God* (1928). He wrote several plays in collaboration with others.

SABOTAGE. Legislative action against sabotage made its appearance in the United States in 1917 and reached its crest in 1919. By that time, no less than 15 States, Alaska, and Hawaii had enacted such laws. The States were Arizona, California, Idaho, Iowa, Kentucky, Michigan, Minnesota, Montana, Nebraska, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Utah, and Washington. Most of the laws were aimed at "criminal syndicalism," which was defined to include advocacy of sabotage. Several laws were more specific. Thus Arizona defined sabotage as willful and malicious injury to property, or violation of the constitutional or statutory rights of another, as a means of accomplishing industrial or political ends. Nebraska's definition covered railroad property, highway bridges, manufacturing plants or equipment, or any farm or manufactured product. Sabotage was defined by North Dakota as setting grain or food products on fire or poisoning

any work or food-producing animal with an intent to hinder or lessen the food supply. Montana defined sabotage as malicious, felonious, intentional, or unlawful damage, injury, or destruction of property; and Washington made it a felony to injure or derange property in order to obstruct any industrial enterprise, to interfere with the management, or to advocate such tactics. The movement against "criminal syndicalism" and sabotage, apparently a product of war psychology, practically stopped with the legislative grist of 1919. Kentucky, in 1922, and Idaho, in 1925, by amendments made their laws less severe.

SACKETT, FREDERICK MOSELEY, Jr. (1868-). A United States Senator. He was born at Providence, R. I., and graduated at Brown University (1890), receiving the LL.B. degree at Harvard in 1893. He practiced law at Columbus, Ohio (1893-97) and at Louisville, Ky. (1898-1907) and was president of the Louisville Gas Company and the Louisville Lighting Company (1907-12). Since 1900 he has been engaged in coal mining. In the World War, he was Federal Food Administrator for Kentucky. He was elected U. S. Senator from Kentucky (as a Republican) for the term expiring in 1931, by a majority of 24,500. In the Senate, he has had the chairmanship of the committee on expenditure in the Executive Departments and has been a member of the committees on District of Columbia, Finance, Interstate Commerce, and Military Affairs.

SACKVILLE-WEST, VICTORIA (MRS. HAROLD NICOLSON) (1892-). A British author of varied talents who was born and brought up at Knole, Sevenoaks. Her works of fiction included *Heritage* (1919); *Grey Wethers*, a romantic novel (1919); *The Dragon in Shallow Waters* (1921); and *The Hcv*, short stories (1922). She also wrote *Seducers in Ecuador*; *Poems of West and East* (1917); *Knole and the Sackvilles*, an exceedingly personal narrative of her ancestors (1923); *Passenger to Teheran*, a description of her travels in Persia (1926); *The Land*, an account of the year's cycle in poetry, awarded the 1927 Hawthornden Prize (1926); and *Aphra Behn, The Incomparable Astrca* (1927). She edited and wrote a historical preface to the *Diary of Anne Clifford* (1923).

SADLER, SIR MICHAEL ERNEST (1861-). A British educator (see VOL. XX), master of University College, Oxford (1923-). He resigned as vice chancellor of Leeds University in 1922. He was chairman of the Teachers' Registration Council (1915-22), president of the Calcutta University Commission (1917-19), and was made Knight Commander of the Star of India in 1919. Besides his many reports on education, he wrote *Our Public Elementary Schools* (1926).

SAINT CATHARINE, COLLEGE OF. A Roman Catholic College for women at St. Paul, Minn., founded in 1911. The number of students increased from 61 in 1914 to 415 in 1927-28, and the members of the faculty from 11 to 40 in the autumn of 1928. A summer session was held in 1928 with an enrollment of 200. The number of volumes in the library increased from 6000 in 1914 to 25,000 in 1928; kindergarten and pre-school courses were added; and Mendel Hall, a five-story science building, was constructed. President, Sister Antonia.

SAINT ELIZABETH, COLLEGE OF. A Roman Catholic college for women, conducted by

the Sisters of Charity at Convent Station, N. J., founded in 1899. The student enrollment increased from 91 in 1913-14 to 302 in 1927-28; the faculty was increased from 22 to 35 members; and the library from 9000 to 16,000 volumes. The annual income increased from \$30,700 to approximately \$189,086. There was no endowment, but the sisters gave their services without remuneration. The curriculum was considerably enlarged, with additional courses in the departments of English, history, music, home economics, and sociology, and a course in leadership of Girl Scouts, and usual facilities for athletics were offered, especially in hockey, soccer, basketball, baseball, tennis, and riding. A new residence hall, with accommodations for 200 students, was completed in 1926, toward the erection of which the Alumnae Association contributed \$157,000. Dean, Sister Marie José Byrne, Ph.D.

SAINT JEAN DE MAURIENNE, AGREEMENT OF. See PEACE CONFERENCE AND TREATIES; WAR, DIPLOMACY OF THE

ST. JOHN'S COLLEGE. A college of liberal arts and sciences for men, at Annapolis, Md., founded as King William's School in 1696. The enrollment increased from about 200 in 1915 to 266 in the autumn term of 1928, and the faculty from 13 members to 27. The R.O.T.C. unit was discontinued in 1926. Orientation courses in literature and social sciences are given to freshmen. President, Enoch B. Garey, LL.D.

ST. LAWRENCE UNIVERSITY. An institution for the higher education of men and women at Canton, N. Y., founded in 1856. The registration for the autumn term of 1928 was 4170, distributed as follows: College of letters and science, 830; theological school, 28; law school, 3312. The faculty numbered 124. The endowment funds of the institution amounted to \$2,316,520, and the income for the year to \$162,133. The library contained 52,000 volumes. Richardson Hall was erected in Brooklyn during the year 1928 for the law school, which is maintained there. Announcement was made in November, 1928, of the gift of \$100,000 to the University from S. L. Carlisle & Co., of New York City, to be available at the rate of \$20,000 a year over a period of five years, and to be used by the University to promote the teaching of forestry. President, Richard Eddy Sykes, D.D.

SAINT LOUIS, saint lōō'is or lōō'ē The chief city of Missouri. The population increased from 687,029 in 1910 to 772,897 in 1920 and to 848,100 in 1928 by estimate of the U. S. Bureau of the Census. The metropolitan area in 1928 had a population of 1,315,000. A proposal for the consolidation of the city of St. Louis and the county of St. Louis into a single municipal governmental unit was defeated at the polls on Oct. 26, 1926. In 1923 the Missouri Supreme Court declared invalid the zoning ordinance of 1918 under which many plans had been made and much work done by the City Plan Commission. The court held that under the charter no such police power was given to the city and that zoning could be undertaken only through eminent domain.

In 1919 the citizens approved a bond issue of \$3,000,000 which included items for the elimination of grade crossings and the reconstruction of existing streets. In 1923 a bond issue of \$87,372,500 for public improvements was carried by

unprecedented majorities. Of this total approximately \$12,000,000 was for a new water-supply system at Howard's Bend on the Missouri River, \$14,450,000 for street openings and improvements, \$8,000,000 for electric street lighting, \$4,000,000 for a new Civil Court House, \$19,000,000 for sewers, \$3,800,000 for parks and playgrounds, \$4,500,000 for hospitals and institutions, \$6,000,000 for a memorial plaza, and \$5,000,000 for a municipal auditorium, facing the plaza, with seating capacity for 12,000 persons. In 1925 the first step was taken in the development of the Civic Centre by the voting of \$5,000,000 for the acquisition of 45 acres of ground and \$10,000,000 for buildings to be located thereon. In 1928 a fourth bond issue of \$2,000,000 was approved for the construction of a municipal airport by enlarging the Lamber-St. Louis Field to 693 acres. By 1929 the major part of these improvements had been carried out. Olive Street, one of the main thoroughfares, had been widened to 100 feet for a distance of 22 blocks, the new Civil Court House, the first unit of the projected Civic Centre, was completed, and the Missouri River water-supply system was put in operation, its principal feature being a 100,000,000-gallon reservoir at Stacy Park, the highest point in St. Louis County, constructed at a cost of \$1,150,000. The most important sewer project was the River des Peres sewer and channel, for which \$11,000,000 in bonds had been voted. In the year 1928 the Chain of Rocks Bridge, 680 feet long, was constructed across the Mississippi River.

The public-school system of St. Louis includes 132 elementary schools, 13 schools for backward children, 6 junior high schools, 7 senior high schools, 1 part-time school, and 1 technical-vocational school, with an attendance of more than 101,000 pupils. There are also many private schools and the Washington and St. Louis universities and Harris Teachers' College. In Forest Park, one of the three largest municipal parks in the United States, there are located the St. Louis Art Museum; the Municipal Open-Air Theatre, in which light opera is presented for 12 weeks each summer by the Municipal Opera Company; the Jefferson Memorial, containing the Lindbergh Trophy Collection, and the St. Louis Zoological Garden, which was started under an ordinance passed in 1913 and which has been supported, like the Art Museum and the Public Library, by the revenue of a mill tax. The Missouri Botanical Garden, popularly called Shaw's Garden, in the southern section of the city, ranks second to Kew Gardens in London for the wide variety of its shrubs, plants, and flowers. The city's 65 parks in 1928 aggregated 2413 acres.

St. Louis is an important railroad centre, 29 railroads, 21 of which are main trunk lines, radiating in all directions. In 1928, 10 new tracks were added to the original 32 tracks of the Union Station at a cost of approximately \$5,000,000. The city is served also by the Federal barge system on the Mississippi River. Statistics compiled by the U. S. Census of Manufactures showed that the number of wage earners had increased from 107,919 in 1919 to 109,428 in 1927, wages from \$108,557,326 in 1919 to \$134,915,061 in 1927, and the value of products manufactured from \$871,700,438 in 1919 to \$937,410,402 in 1927. By 1929 according to local estimates there were 3209 industrial establishments, representing 357 lines of manufacture. St. Louis has 58 banks with total resources of \$681,658,033; bank

clearings in 1928 amounted to \$7,566,304,781. The city is also the home of the Federal Reserve Bank of the eighth district and has a Federal Land Bank and a Federal Credit Bank. The assessed valuation of property in 1928, according to local estimate was \$1,172,002,100; the net debt in 1927 was \$34,388,000.

SAINT LOUIS SYMPHONY ORCHESTRA. See MUSIC, *Orchestras*.

SAINT MIHIEL. See WORLD WAR, *Western Front*.

SAINT PAUL. The capital of Minnesota. The population increased from 214,744 in 1910 to 234,698 in 1920, according to the Federal census, and to 358,162 in 1928, according to local estimate. The city has been under the commission form of government since 1912, but for several years there has been agitation for the adoption of the city-manager plan. In 1917 a city-planning ordinance was passed, providing for a city-planning commission of 25 members appointed by the mayor. This commission recommended improvements designed to give better routing of traffic across and around the city in order to relieve the congestion of the business districts. The next year a zoning ordinance was adopted, providing for six use districts, including three residence, one commercial, one light industrial, and one heavy industrial, and four height districts in which the heights of buildings varied from 40 to 150 feet. In 1927 a city-wide group, known as the United Improvement Council, was organized for the purpose of considering the physical needs of St. Paul. The programme which they prepared was authorized by the voters at the general election in November, 1928. Among the improvements for which a \$15,077,000 bond issue was voted, were new court house, city hall, and auditorium, greater development of the municipal airport and barge terminal, widening of streets, extension of sewer and water-supply systems, parks and playgrounds, branch libraries, and other projects.

A school bond issue of \$3,000,000 was voted in 1917, and in 1919 the \$6-per-capita limit for school taxation was removed. The following year, a second bond issue of \$5,000,000 was voted for the construction of new school buildings and the remodeling of old ones. By 1925, 17 new buildings had been erected, including grade, junior, and senior high schools. In 1926 St. Paul had 80 public schools with a student enrollment of 41,603, its school properties were valued at more than \$15,000,000.

In June, 1926, the voters of St. Paul authorized a bond issue of \$295,000 for the acquisition of land for a municipal airport and \$450,000 for the development of a river barge terminal. The airport, 150 acres in extent, was situated on a bend of the Mississippi River adjoining a well-developed industrial section one mile from the downtown district. In the 1928 municipal-improvement programme, an additional \$550,000 was included to increase the size of the airport and to install additional hangars and other necessary equipment. The 1928 bond issue also included \$150,000 to be expended on further development of the river barge terminal in connection with the activities of the Inland Waterways Corporation, operating the Mississippi River barge line from Minneapolis and St. Paul to New Orleans. Belt-line connections with the nine railroads entering St. Paul were also completed.

In 1920 three concrete-arch bridges were constructed across the Mississippi River: the Robert Street Bridge, the Inter-city Bridge, and the Cedar Street Bridge. The Robert Street Bridge, which was built at a cost of \$1,800,000, had a 264-ft. channel span, a 56-ft. clear roadway, and two 10-ft. sidewalks. The total length of the bridge, including approaches, was approximately 1900 feet. The Inter-city Bridge, which had five arches of the rib type, three of 300-ft. and two of 139-ft., span, was 1516 feet long between abutments and was built at a cost of \$1,322,084. The Cedar Street Bridge was designed with seven arch spans of the two-rib type, two with clear spans of 265½ feet and five of 93 feet, the total length between abutments being 1146 feet. The roadway was 112 feet above water, and the estimated cost of the bridge was \$1,076,000. In 1928 St. Paul had 86 parks, totaling 2200 acres and valued at \$6,465,489. The establishment of Highland Park in 1921 in the southwestern part of the city opened up that section to residential development.

In 1927, 21,449 persons were employed in approximately 625 industrial establishments in St. Paul and received \$28,163,350 in wages; the value of products manufactured was \$160,330,540. The principal lines of manufacturing were: printing and paper products, fur goods, shoes, drugs, meat packing, dairy products, automobiles, machine and foundry products. Bank clearings increased from \$576,156,228 in 1910 to \$1,626,301,000 in 1928. In 1928 the city had 36 banks with total deposits of \$170,000,000 and resources of \$189,350,000. The value of building permits issued in 1927 was \$10,128,589. The assessed valuation of property in 1928 was \$271,868,177; the net debt was \$26,744,522.

SAINT PETERSBURG. See LENINGRAD.

SAINT PIERRE AND MIQUELON, mǎ-ke-lôn'. The principal islands of two groups off the south coast of Newfoundland, belonging to France. Total area, 93 square miles; population (1926), 4030, which is increased to 12,000 during the fishing season. The only activity is cod fishing. Great gains were made in cod fishing during and after the World War, as the trade records reveal. Imports for 1913, 1920, and 1927, were 4,536,745, 4,846,742, and 165,801,030 francs. Exports for the same year were 6,201,798, 28,047,100, and 127,409,172 francs. Receipts for 1927 were 8,985,250 francs and expenditures, 8,983,469 francs. The budget for 1928 balanced at 10,011,500 francs.

SAINTS'BURY, GEORGE EDWARD BATEMAN (1845-). An English critic and literary historian (see VOL. XX). His list of honorary degrees was lengthened by an LL.D. from Edinburgh University in 1919. His later works include *The Poets of the Augustans* (1915); *A History of the French Novel* (2 vols., 1917, 1919); *Notes on a Cellar Book* (1920); *A Letter-Book* (1922); *A Scrap Book* (1922); *A Second Scrap Book* (1923); *Collected Essays and Papers* (4 vols., 1924), and *A Last Scrap Book* (1924).

SAINT THERESA, COLLEGE OF. An institution for women, founded by the Sisters of St. Francis at Winona, Minn., in 1910. The college is a member of the North Central Association of Colleges and it is accredited by the Association of American Universities. It confers degrees of bachelor of arts, bachelor of science, and bachelor of science in nursing. The student body in 1927-28 numbered 553. Between the time it was founded and 1928, the College ac-

quired buildings of an estimated value of \$2,000,000; a productive endowment of \$500,000. A chapel and a faculty house were finished in 1924. In 1920 the Saint Clare School of Education was organized in connection with the college to train Sisters for the parochial schools, the first fully organized and accredited school of its kind in the country. A dormitory to accommodate 450 students was opened in January 1929. President, Sister Mary Aloysius Molloy, Ph.D.

SAJOUS, sǎ'zhōō', CHARLES E. DE M. (1852-1929). An American physician (see VOL. XX). From 1921 until his death, Dr. Sajous was professor of endocrinology in the University of Pennsylvania. He was made an associate of the French Academy, an officer of the French Legion of Honor, and a knight of the Order of Leopold (Belgium). In 1922, his well-known work, *The Internal Secretions and the Principles of Medicine*, passed through its tenth edition and in the same year his *Analytic Cyclopaedia of Practical Medicine* appeared for the ninth time. In 1926, he published *The Strength of Religion as Shown by Science*. Dr. Sajous resigned as editor of the *New York Medical Journal* in 1919, after having served in this capacity since 1911.

SAKHALIN, sǎ'kà-lyén. An island off the east coast of Siberia. The region to the north of the parallel of 50 degrees is Russian territory and part of the Sakhalin Province. It has an area of 14,668 square miles and a population of 34,000 (1915). Eighty per cent of the region is covered with forest and lumbering is the chief occupation. Japanese Sakhalin, or Karafuto, had an area of 13,934 square miles and a population of 203,573 at the census of 1926, as compared with 39,846 in 1913. Under the Japanese, the exploitation of their territory was rapidly pushed. The herring fisheries had the greatest economic value, while the presence of great forests indicated that lumbering and paper-making would soon become important. Pulp mills have been established. An enlightened government interest encourages agriculture, and settlers are provided with land, domestic animals, and seed. Three coal basins yielded 275,819 tons in 1926. The budget for 1928-29 balanced at 27,340,000 yen. In 1920 Japanese forces occupied the Russian portion as a result of the so-called Massacre of Nikolayevsk, the capital of Sakhalin Province on the Amur River, when all the Japanese residents, numbering about 350, were slain. Responsibility was difficult to establish, and against the protests of the Russians, the Japanese troops stayed on. At a Russo-Japanese conference held on Sept. 4, 1922, Japan demanded reparations as the price of withdrawal. In January, 1925, Japan and Russia reached an agreement by the terms of which Japan was to evacuate Russian Sakhalin by May of that year. See JAPAN; RUSSIA; SIBERIA.

SALANDRA, sǎ-lün'dra, ANTONIO (1853-). An Italian statesman (see VOL. XX). At the outbreak of the World War, he opposed Italy's joining her forces with Germany and Austria on the ground that they were the aggressors. The majority of the Italians supported him, and when opposition caused him to resign in May, 1915, feeling on behalf of Salandra and the Allies rose to such a height that it actually threatened the throne. "War or a republic" was the cry. The King refused to accept Salandra's resignation, and in 10 days Italy en-

tered the War on the side of the Allies. Salandra's premiership lasted until June, 1916. At first, he was a supporter of the Fascist régime, and was Italian representative in the Council of the League of Nations until 1926, when he resigned and withdrew his support from the Fascist government. Afterward, he took no active part in politics, although appointed senator in May, 1928, by the King.

SALISBURY, salz'ber-I, JAMES EDWARD HUBERT GANCOYNE-CECIL, FOURTH MARQUIS OF (1801-). An English statesman born in London and educated at Eton and University College, Oxford. He was a Conservative member of Parliament from 1885-1903, when he succeeded to the title on the death of his father, and was chairman of the Church Parliamentary Committee until 1900, Under-Secretary for Foreign Affairs (1900-03), and Lord Privy Seal (1903-05). He resigned the latter office to become president of the Board of Trade. After a long period of inactivity, he reentered the Government as Chancellor of the Duchy of Lancaster (1922-23), Lord President of the Council (1922-24), and again Lord Privy Seal (1924-29). In 1925 he became leader of the House of Lords. In 1926 he was the leader of the Empire Parliamentary Delegation which visited Australasia. He received many honors including the Order of the Garter in 1917.

SALMON, THOMAS WILLIAM (1876-1927). An American physician and psychiatrist, born in Lansingburg, N. Y., who received his medical degree from the Albany Medical College in 1899. He was on the staff of the U. S. Marine Hospital Service (1903-15), medical director of the National Committee for Mental Hygiene (1915-21), and a member of the staff of the Rockefeller Foundation. During the World War, he was consultant in neuro-psychiatry to the American Expeditionary Forces in France and for making possible the control of shell shock among the troops, he received from Congress the Distinguished Service Medal. In 1921 he was appointed professor of psychiatry at Columbia University. He had served as president of both the American Neurological and American Psychiatric associations. On Aug. 13, 1927, he was drowned off Westhook, N. Y.

SALONIKI. See WORLD WAR, *Balkan Front*.

SALTEN, FELIX (1869-). An Austrian essayist, novelist and dramatist, born in Budapest. He wrote the novels *Die Hinterbliebenen* (1899); *Herr Wenzel auf Rehberg* (1906); *Künstler-Frauen* (1908); *Die clingende Schelle* (1914); *Der Hund von Florenz* (1921); *Martin Overbeck* (1927); and *Bambi* (1928), and the plays *Tom andern Ufer* (1908); *Das stärkere Band* (1912); *Kinder der Freude* (1916). Other works were of a critical nature. *Wiener Adel* (1905); *Das österreichische Antlitz* (1909); *Gestalten und Erscheinungen* (1913); and *Schauen und Spielen* (1921).

SALT LAKE CITY. The capital of Utah. The population increased from 92,777 in 1910 to 118,110 in 1920 and to 138,000 in 1928 by estimate of the U. S. Bureau of the Census. Since 1914 smoke-regulating ordinances and a use zoning law have been adopted and a municipal bathhouse built. In 1915-16 the water supply of the city was nearly doubled by the construction of two dams in Big Cottonwood Canyon, impounding 550,000,000 gallons of water, and in 1927 construction was begun on Echo Dam, 1800 feet long and 125 feet high, to furnish storage

for the Salt Lake Basin irrigation project. Bank clearings fell from \$825,366,200 in 1919 to \$661,-680,278 in 1921 and rose again to \$785,320,679 in 1923 and to \$956,846,063 in 1928. Building permits increased from \$4,060,496 in 1919 to \$5,361,376 in 1928. Among the structures erected during that period were Hotel Utah, Walker Bank, Clift, Kearns, Newhouse Hotel, Desert Bank, and Continental Bank buildings. In 1927, 4709 persons were employed by 216 industrial establishments and received \$5,965,151 in wages; the value of products manufactured was \$35,114,-793. In 1927 Salt Lake City had 48 public schools, including 7 junior high schools and 2 high schools, with an enrollment of 31,542 pupils. Until 1929 the Utah airport ranked second only to Chicago in the number of emanating lines. It was the converging point for all air mail from the Pacific coast to eastern points and, vice versa, the diverging point for all air cargo from the East to the Pacific coast. The assessed valuation of property in 1927 was \$194,146,000; the net debt was \$9,034,000.

SALVADOR, sal'va-dör'. The smallest of the Central American republics, with an area (officially estimated) of 13,176 square miles and a population (census of 1923) of 1,360,382 (estimated in 1928, 1,688,129). The official estimate for 1913 was 1,225,835. In 1927 there were 1557 primary teachers in 859 government schools, while the number of pupils was 47,467. Populations of the large cities (estimated in 1927) are San Salvador, the capital, 100,000; Santa Ana, 74,200; San Miguel, 37,000; San Vicente, 33,000. On June 7, 1917, an earthquake and volcanic eruption did much damage to the capital and partially destroyed several smaller towns. An earthquake of great intensity again shook the city of San Salvador on Apr. 28, 1919.

Industry. Coffee culture is the leading activity, and an average of 65,000,000 pounds is exported annually. The 1928 production was 120,000,000 pounds. Sugar made considerable advances, with a 1927 production of 7742 tons, valued at \$1,000,000. Cacao, rubber, tobacco, and wheat for local consumption are being given increasing attention. After 1914 gold and silver mining showed possibilities, especially in the departments of Morazán, San Miguel, and La Unión. The foreign trade from 1913 on increased regularly: exports in 1913, \$9,011,112; in 1920, \$17,943,827; in 1927, \$14,100,000. Coffee averaged 89 per cent of the export value in 1927. Other exports are sugar, henequen, gold and silver coin, balsam, hemp, hides, and rubber. Imports in 1913 were valued at \$6,174,000. In 1922 they were \$7,426,760, and in 1927, \$14,785,000. Leading imports are cottons, hardware, flour, drugs, and chemicals. Trade with the United States in 1913 was imports, \$2,491,000; exports, \$2,824,000. Imports from the United States in 1927 were \$6,876,000; exports to that country (in 1925) \$2,807,000. Salvador has begun to develop industrially and, besides supplying many articles for domestic consumption, exports manufactured products to neighboring countries. Local mills manufacture cotton and silk fabrics, leather goods, fibre goods, cigars, cigarettes, sugar, etc. Electrical power is being used. Stock raising also is gaining in importance.

Finance. For 1914-15 the revenues were \$6,286,470 and the expenditures \$6,263,878. For 1927 they were \$10,257,246 and \$10,899,764. The budget for 1928-29 provided for revenues

of \$11,566,000 and expenditures of \$11,601,243. The national debt in 1913 was \$10,995,854. On Dec 31, 1927, it was \$24,255,851. A \$6,000,000 loan was negotiated in the United States in 1922. Payment of \$1,835,487 for service of the loan for 1929 was made Apr 22, 1929. The three banks of issue on Dec. 31, 1926, had notes in circulation to the value of \$8,059,500. The colon in 1919 was fixed at \$0.50 and by the law of July 16, was made the monetary unit.

Communications. In 1927, 349 miles of railway were open, all of narrow gauge. The International Railways line from east to west was completed in 1922 when the third section was opened from San Vicente to Cojutepeque. The railway starts at La Union. In 1927 there were 2602 miles of telegraph wire and 3940 miles of telephone line. An airplane service was established between San Salvador, Guatemala City, and other Central American points in 1928. In 1929 the 80-mile railway between Salvador and Guatemala was completed at a cost of approximately \$12,000,000. This brought Salvador nearer to the markets of the United States.

History. Salvador was the first country to move toward effecting a better understanding among Central American states. On June 24, 1920, it sent out an invitation for a general meeting, and conferences were begun at Antigua in Guatemala on Nov 1, 1920. On Jan. 21, 1921, a pact was signed by Salvador, Honduras, and Guatemala for a Central American Union, thus crowning with temporary success the aspirations of a century. Salvador was the only Central American country not to declare war on Germany. In 1913 Salvador signed an arbitration treaty with the United States and a commercial treaty in 1919. Considerable local ill feeling was generated toward the United States because it was felt that the Bryan-Chamorro Treaty of 1916, in giving the United States a naval base on Fonseca Bay, violated Salvador's sovereignty. Suit was made before the American Court of Justice, and although the complaint was successful, both Nicaragua and the United States disregarded Salvador's contention. Peace was general in the country after 1914, as a result of the insistence of the United States President for 1919-23, Jorge Meléndez; for 1923-27, the Vice-President, Alfonso Quirón Molina, was raised to the Presidency; for 1927-31, Dr. Pio Romero Bosque. See CENTRAL AMERICAN UNION.

SALVARSAN. See SYPHILIS.

SALVATION ARMY. A religious organization aiming to evangelize the masses considered outside the influence of churches, founded by the late Gen William Booth in London in 1865, and incorporated in New York State in 1899. In the years between 1914 and the opening of 1928, the number of corps and outposts in the United States increased from 852 to 1655. By 1929 the Salvation Army employed, throughout the world, 152,958 local officers and handsomen; 62,265 singers; 35,109 corps cadets; and 10,000 persons without rank. Its institutions included 1630 social agencies; 1186 day schools, 31 naval and military homes; 149 hotels for men, and 53 for women, 5 married homes; 100 children's homes; 24 industrial schools; 112 women's industrial homes; 79 maternity homes; 176 slum posts; and 140 labor bureaus. The Salvation Army continued work among prisoners, and each year provided summer outings, and Christmas and Thanksgiving dinners for the poor.

In the United States, the Salvation Army is divided into four territories, with headquarters at New York, Chicago, San Francisco, and Atlanta, the latter having been added in 1926. Each territory maintains a training college, and in 1928 a second institution was opened at San Francisco; each also publishes two weekly periodicals, the *War Cry* and the *Young Soldier*. In 1928, 85 new Salvation Army buildings were opened in the United States, and an administrative centre which will provide rooms for 400 business girls was started on the site of the national headquarters at 120 West 14th Street, New York City.

The most significant event in the recent history of the Salvation Army was the meeting of the high council in London, attended by 64 territorial leaders from all parts of the world, including Evangeline Booth, national commander in the United States. After considerable controversy, the council, in February, 1929, voted to remove William Bramwell Booth, general of the Army, from office on the ground that illness had rendered him unfit for service. He died June 17, 1929, and Commissioner Edward J. Higgins, chief of the staff, was elected his successor. Other important events were the ceremony at the cornerstone laying of the proposed International Training College in Denmark Hall, South London, in 1928, and the unveiling of the Mile End Memorial to William Booth in the same year. The activities of the Salvation Army were extended to Dutch Guiana in 1928, bringing the number of countries and colonies in which the Army was active to 86.

SALZBURG, *saltsburk*. A province of the Republic of Austria. Its area in 1910 and 1923 was 2761.9 square miles. Its population in 1910 was 214,737, in 1923, 223,023. See AUSTRIAN REPUBLIC.

SAMOA. See PACIFIC OCEAN ISLANDS.

SAMOA, AMERICAN. American Samoa with a gross area of 75 square miles, comprises the island of Tutuila and several other small islands in the Pacific Ocean. The population in 1926 was 8685, compared with 7251 in 1912 and 7376 in 1916. The people are almost entirely Samoans. In 1920 these included 3166 males and 3019 females.

Products. The soil of American Samoa is rich and well-adapted to the growing of fruits, which include the orange, lemon, lime, citron, mango, alligator pear, pineapple, banana, and other native fruits. The vegetables grown include the bread fruit, taro, and yam. Sugar cane is grown to some extent, especially for the leaves which are used for thatch on the native houses. Coffee also has been grown in small quantities with success and tobacco is grown by the natives for native consumption. The most important product of the soil, however, is the coconut, which is used as food for the natives, while the water of the green nuts is used for drink. Copra, the dried kernel of the ripe coconut, forms the chief article of commerce, and is the only export from American Samoa. It is shipped to foreign countries where oil is expressed from it. This oil is in great demand in the manufacture of coconut butters of various kinds, soaps, oil for salads, and for other purposes. The annual output of copra is about 1300 tons.

Industries. There are practically no industries in the islands. Copra is dried by spreading it in the sun. Native women manufacture

floor mats and sleeping mats from the leaves of the pandanus, but these are not often for sale. Wai clubs, fans, baskets, hats, and necklaces of shells and beads are made to sell to tourists.

Trade. Copra is the only considerable export. Imports have decreased in value since 1920, and totaled \$147,577 in 1927, of which \$65,086 came from the United States. Exports of merchandise to the United States in 1927 totaled \$40,852 in value. This was a decline from \$102,895 in 1924 when total exports were \$150,250. In 1925 the total exports amounted to \$150,333, the largest since 1917 when they were \$198,499.

Finance. American Samoa has no public debt. The bank is conducted under the supervision of the officials. The customs revenues are used for the upkeep of roads, schools, and general island government expenses. The navy tax fund is chiefly used for the pay of native officials.

Transportation. A monthly schedule is maintained between San Francisco, Honolulu, Pago Pago, and Sydney, by the Oceanic Steamship Company. Over 50 miles of roads have been constructed since American occupation.

Education. The foundation of the school system of American Samoa is the parish school conducted by the native pastors of the various denominations. There is no government supervision except that by law all children between the ages of 6 and 13 are required to attend school regularly. Schools are maintained by Roman Catholics, Wesleyans, Mormons, and by the London Missionary Society. Since 1904, the Maist Brothers have conducted a special district school at Leone. Prior to 1921, there was but one school which could actually be called a government or public school. In January of that year, Governor Evans instituted plans for a widespread development and expansion of the public-school system throughout Samoa. A Board of Education was appointed and as a result, Tutuila was divided into 13 school districts and the Manua district into two, for the purpose of establishing a graded school in each of these districts. By 1928, 19 such graded schools had been established. The average attendance in the various schools is about 2500.

Health and Sanitation. As a result of sanitary supervision, education, and free medical treatment, the natives of American Samoa have increased in numbers 41 per cent under the American occupation, from 1900 to 1920. The prevailing diseases are hookworm, influenza, and filariasis. At various times, there have been serious epidemics of measles, malaria, cholera, and smallpox are unknown in Samoa. The Government maintains dispensaries and a sanitation inspector makes public inspection of all villages. As a result, health conditions in the island have remained good.

SAMUEL, HAROLD (1879-). A British pianist, born in London. He studied under Danneureuther and Stanford at the Royal College of Music. While the universality of his taste and his extraordinary art were immediately recognized by connoisseurs, it was not until 1921, when he gave in London a Bach week, playing the major works on six successive days, that he brought the general public to his feet. With this same Bach programme, he created a sensation at his American debut (New York, Jan. 18-23, 1926). Since then, he has been an annual visitor in the United States.

SAM'UEL, Rt. Hon. Sir Herbert (Louis) (1870-). An English public official (see Vol. XX). He was Chancellor of the Duchy of Lancaster, and Postmaster-General, both for the second time in 1915-16. He was Secretary of State for Home Affairs (1916), chairman of the House of Commons' Committee on National Expenditure (1917-18), and president of the Royal Statistical Society (1918-19). In 1919 he was British Commissioner to Belgium and in the next year became High Commissioner of Palestine (1920-25), where the handling of a delicate situation caused by the fierce clashing of mutually hostile nationalities called forth all his ability in diplomacy and fair dealing. He was chairman of the Royal Commission on the Coal Mining Industry (1925-26), which attempted to find a solution that would avert a the coal strike of 1926. Since 1927 he has been chairman of the Liberal Party. He was returned to the House of Commons in 1929. In 1917 he published *The War and Liberty*.

SAN ANTONIO. The largest city of Texas. The population increased from 96,614 in 1910 to 161,379 in 1920 and to 218,100 in 1928, by estimate of the U. S. Bureau of the Census. The 1928 city-planning project was undertaken to determine the present and prospective needs of the city and to make a definite city plan for its future guidance. Since the discovery of oil in 1915, San Antonio has become the centre of a large oil-producing territory. The first field was discovered at Somerset, 18 miles south of the city, large fields were subsequently discovered at Luling, Mirando, and Callham. In 1923 a bond issue of \$4,150,000 was voted for public improvements, including \$2,800,000 for a flood-protection programme and an additional \$200,000 to be added to the \$500,000 previously voted for a municipal auditorium. This auditorium, which was completed in 1928, in its baroque Spanish treatment is architecturally one of the outstanding features of the city. In the same year, there was completed the group of buildings erected by the Smith Properties Corporation at a total cost of \$7,500,000, these included the Plaza Hotel and the Smith-Young Tower, an office building 35 stories in height. Seven junior-high-school centres have been completed since 1920 at a cost of \$1,500,000. In 1927, 6363 persons were employed in 335 industrial establishments in San Antonio and received \$6,385,000 in wages; the value of products manufactured was \$45,165,000. In 1929 the city spent \$2,455,000 on street maintenance and widening. Building permits increased in value from \$2,619,060 in 1919 to \$16,467,066 in 1928. The assessed valuation of property in 1927 was \$203,899,000; the net debt was \$23,385,000. Bank clearings in 1928 amounted to \$870,751,991. The U. S. Army has concentrated at San Antonio its large aviation fields; Kelly, Brooks, and Duncan fields have a combined area of 2634 acres and cost \$3,643,125. In 1929 Randolph Field, for the training of army air candidates, was under construction at a cost of approximately \$15,000,000. The Southern Air Transport Company has established, adjacent to the municipal airport, a large training school at which all aviators, receiving preliminary training at the other 25 fields owned by this company, receive their final instruction.

SANDBURG, CARL (1878-). An American poet and editor, born at Galesburg, Ill., and educated at Lombard College of that city. He served as a private in the War with Spain

in 1898, was secretary to the Mayor of Milwaukee, Wis., from 1910 to 1912, and in 1913 went to Chicago, where he became associate editor of the magazine, *System*. He did newspaper writing for a while, received the Levinson Prize from the *Poetry Magazine* in 1914, and had a half share in the prize of the Poetry Society of America in 1919 and 1921. One of the first to follow Masters in the use of free verse, Sandburg soon came to be recognized as the leader of the Western poets. His verse was harsh and unrythmic; his themes tended to be brutal and showed too great a fondness for the so-called primitive character of American civilization. But there was also beauty in his poetry and a sensitiveness which even his realistic preoccupations could not obliterate. His writings include: *Chicago Poems* (1915), *Corn Huskers* (1918); *The Chicago Race Riots* (1919); *Smoke and Steel* (1920); *Slabs of the Sunburnt West* (1922); *Rootabaga Stories* (1922); *Rootabaga Pigeons* (1923); *Selected Poems* (1926); *Abraham Lincoln—the Prairie Years* (2 vols., 1926); *The American Songbag*, a collection of folk songs and ballads (1927); and *Good Morning, America*, poems (1928).

SANDERSON, JULIA (MRS B. BARNETTE) (1884—). An American actress and singer, born at Springfield, Mass. She made her debut with the Forepaugh Stock Company in Philadelphia and in 1902 came to New York City, where she first appeared at the Casino in *Winnome Winnie* and later as Mrs. Pineapple in *A Chinese Honeymoon* and in other popular rôles. After playing in *The Honorable Phil* in London, she returned to the United States and was in various musical comedies.

SANDRE, THIERRY (1890—). The pseudonym of Charles Moulié, a French writer who was born at Bayonne and educated at the Collège d'Arras and the lycée of Lille. He received an excellent literary training as secretary for Binet-Valmer, Pierre Louys, and Gilbert de Voisins. His first attempts at writing were translations from the Greek and Latin. He was also a poet, his pre-war volumes being *Les Mignardises* and *En Sourdeine*. During the World War, in which he was in the artillery, he wrote *Fleurs du desert*, and many other poems, including a series, *Sur le grand péril des cités*. Then he turned to prose and in 1924 received the Prix Goncourt for *Le Purgatoire*, his experiences as a prisoner in Germany, and *Le Chèvrefeuille*, a war story. His other works include *Mousselme* (1924); *L'histoire macabre de Robert le Diable* (1925); *Panouille* (1926), and *Les yeux fermés* (1928).

SANFORD, EDWARD FERRY (1865—). An American jurist. Born at Knoxville, Tenn., he studied at the University of Tennessee and at Harvard (A.B., 1885; LL.B., 1889), was admitted to the bar and served as Assistant Attorney General of the United States (1907-08) and as United States district judge for the eastern and middle districts of Tennessee (1908-23). Since 1923 he has been Associate Justice of the United States Supreme Court.

SAN FRANCISCO. The second city in size in California. The population increased from 416,912 in 1910 to 506,676 in 1920 and to 585,300 in 1928, by estimate of the U. S. Bureau of the Census. An important part of the city's development since 1914 has been the creation of the Civic Centre. The original buildings, fronting the five-acre plaza, were: the City Hall, a four-

story building erected at a cost of \$3,500,000; the Public Library, built in Italian Renaissance style and costing \$1,153,000, the State of California Building, erected at a cost of \$1,350,000 to house State courts and other offices; and the Municipal Auditorium, erected for the Panama-Pacific International Exposition in 1915, commemorating the opening of the Panama Canal, at a cost of \$1,086,000. In 1929 a war-memorial group of two buildings was under construction. One building was to house a war-relics museum, the other was to serve as a concert hall. Among the important commercial structures erected recently were the Pacific Gas & Electric Co., the Telephone, the Russ, and the Stock Exchange buildings. After careful study and mapping under the direction of the city engineer, the City Planning Commission completed and secured the adoption in 1921 of an ordinance dividing the city into six use zones. The 150th anniversary of the city's founding by Spanish settlers was celebrated in October, 1926.

Between 1923 and 1929, the construction of three important bridges was undertaken. The Carquinez Straits Bridge, spanning the upper reach of San Francisco Bay between Vallejo and Valcona, was opened to traffic in May, 1927. It consists of two 1100-ft. spans, and its design, of the cantilever type, provides for earthquake resistance. The Dumbarton Highway Bridge, constructed across the lower end of San Francisco Bay in 1926, is one of the largest toll bridges in the West. The San Francisco Bay toll bridge between Little Coyote Point and Mt. Eden is 7.1 miles long from shore line to shore line and was completed in 1929 at a cost of \$7,500,000.

In 1925 a vehicular tunnel was constructed at the Market Street Ferry Terminal at a cost of approximately \$350,000. Its total length was 986 feet. Half of the expense was met by the Harbor Commission; the Market Street Railway Company and the Municipal Railways each contributed one-eighth of the cost and the city the remainder. Since 1910 the city has been developing the Hetch Hetchy Water Supply System from the Tuolumne River, 168 miles away. By 1929 the O'Shaughnessy Dam in Yosemite Park and the aqueduct to the Mokelumne power plant had been completed and the plant itself was yielding some \$2,000,000 revenue yearly in power sales. In 1928 a bond issue of \$65,000,000, was voted to provide for the purchase of the distribution system of the Spring Valley Water Company and the completion of the last link of the aqueduct, the 45 miles of steel pipes across the San Joaquin Valley. See WATER SUPPLY.

The Harbor of San Francisco, which extends from the confluence of the Sacramento and San Joaquin rivers at the northeast end of the bay to a point in Santa Clara County at the south, covers an area of 450 square miles. There are 43 docks and piers operated by the California State Harbor Commission and interconnected by a belt-line railroad. These docks and piers afford more than 18 miles of berthing space with 168 square miles of cargo area. In 1929 two new piers, each costing more than \$2,000,000, were constructed. San Francisco ranks second only to New York in total amount of water-borne commerce, in 1927 this commerce amounted to 24,281,188 long tons. In 1928, 7555 vessels of 18,100,440 registered tons arrived at the port, and 7705 vessels of 17,895,006 registered tons departed. Exports in 1928 were valued at \$201,440,402 and imports at \$198,301,326. More than 75 steamship com-

panies operate vessels regularly in and out of the port of San Francisco. The municipal airport at Mills Field was opened in May, 1927. In 1928 there were 355 1/2 miles of street railway in San Francisco under the operation of three companies. The construction of the Twin Peaks Tunnel, 2 1/4 miles long, 25 feet wide, and costing \$4,750,000, completed in 1917, made possible the development of a large new residential section. Two bond issues, passed in 1928, made available \$10,780,000 for the construction of nine boulevards, seven of which were designed to improve traffic conditions on routes leading to the San Francisco-San Mateo county line. In 1928 San Francisco had 70 parks and playgrounds. The Fleishacker Playfield, fronting on the Pacific Ocean, contained one of the largest outdoor swimming pools in the world.

The school system of San Francisco was thoroughly revised in 1922, following for the most part the recommendations incorporated in a report of a survey of the schools made by the U. S. Bureau of Education at the request of the city. Between 1920 and 1928, \$5,000,000 was expended in purchasing sites, \$17,000,000 on buildings and equipment, and \$2,000,000 on maintenance and repairs. During this period, three new high-school buildings, each costing approximately \$1,500,000, four large junior-high-school buildings, and 29 elementary-school buildings were erected. In 1929 there were 87 elementary schools, 9 junior high schools, 8 high schools, 4 evening high schools, 5 evening elementary schools, 1 part-time school, and 1 ungraded school. The total enrollment in 1928 was 102,173.

The industries of San Francisco are diversified, the U. S. Census of Manufactures reporting 181 different classifications. In 1927, according to the San Francisco Chamber of Commerce, 42,078 persons were employed by 2086 industrial establishments and received \$61,108,185 in wages; the value of products manufactured was \$437,925,582. In 1926 San Francisco had 21,006 retail establishments, whose annual sales amounted to \$442,173,000, and 3980 wholesale establishments, whose annual sales amounted to \$1,430,882,600. The clearings of the San Francisco banks in 1928 amounted to \$11,491,219,374; the city is also the home of the Federal Reserve Bank of the twelfth district. In 1928, 8056 building permits representing a value of \$37,766,731 were issued. The assessed valuation of real and personal property in 1928 was \$1,055,867,698, the bonded debt was \$94,538,600.

SANGER, MARGARET H. (MRS. J. NOAH H. SLEE) (1883-). An American birth control advocate. She was active in birth control propaganda after 1914. Frequently arrested, she served a 30-day sentence in 1916. Mrs. Sanger was editor of the *Woman Rebel*, which gave way in 1917 to the *Birth Control Review*. The latter publication was the organ of the American Birth Control League in which were grouped prominent club women and social workers interested in the population question. Mrs. Sanger, as president of the league, directed an international propaganda for breaking down the taboos on birth-control information. She lectured in various parts of the United States and in Japan, and called to her support English publicists like Harold Cox, editor of the *Edinburgh Review*, and Havelock Ellis. She organized the first World Population Conference, held at Geneva in 1927. Besides writing numerous pamphlets, Mrs. Sanger was the author

of the following books: *What Every Girl Should Know* (1914); *What Every Mother Should Know* (1916); *The Case for Birth Control* (1917); *Woman, Immorality, and Birth Control*; *Woman and the New Race*, with a preface by Havelock Ellis (1920); *The Pivot of Civilization* (1922); *The New Motherhood*, with introductions by Harold Cox and Havelock Ellis (1922); *Happiness in Marriage* (1927); *Motherhood in Bondage* (1928). See BIRTH CONTROL.

SANGSTER, MARGARET ELIZABETH (MRS. CARROLL M. SHERIDAN) (1894-). An American author, born in Brooklyn, N. Y. She became associate editor of the *Christian Herald* in 1913 and in 1918 she visited Belgium, Germany, and France as correspondent for that periodical. Her poems and stories include: *Friends o' Mine* (1913); *Real People and Dreams* (1914); *Cross Roads* (1919); *The Island of Faith* (1921); *Your Book and Mine* (1923); *Five Thousand a Year* (1924); *The Hill of Ambition* (1925).

SANKEY, Rt Hon. Sir John (1866-). An English jurist and public official, who was educated at Lancing College and Jesus College, Oxford. He was called to the Bar, Middle Temple, in 1892, and served as chancellor of the Diocese of Llandaff (1909-14); judge of the King's Bench Division (1914-28); Lord Justice of Appeal (1928-29), and as Lord High Chancellor in the Labor Cabinet formed in 1929. He was chairman of the Coal Industry Commission (1919) and its report recommending nationalization of British coal mines was designated as the Sankey Report. Knighted in 1917, he became a member of the Privy Council in 1928.

SANKEY COMMISSION. See GREAT BRITAIN. *History*.

SAN MARINO, mǎ-rē'nō. A republic of Europe located in the peninsula of Italy. Area, 38 square miles, population, 13,013, in December, 1928, as compared with 10,480 in 1910. Revenues and expenditures for 1926-27 balanced at 4,145,179 lire and for 1927-28 at 4,053,072 lire. There is no public debt. The treaty of friendship with Italy was renewed in 1914 and 1920. Representatives of San Marino are to be found at London, Paris, Rome, and Barcelona. The chief exports are wine, cattle, and building stone.

SAN REMO CONFERENCE. See PEACE CONFERENCE AND TREATIES, REPARATIONS.

SANTAYANA, sǎn'tā-yā'nā, GEORGE (1863-). An American philosopher of Spanish extraction (see Vol. XX). He resigned from the faculty of Harvard University in 1912, and lived thereafter in England and on the continent. He collaborated in 1920 with a group of other American philosophers in the publication of the *Essays on Critical Realism*. Here, the attempt is made to save philosophy from mentalism and skepticism through the revival of the classic distinction of essence and existence, both notions conceived as independent of the knowing subject. In his subsequent development, Santayana seemed to move away even from such critical realism. His *Scepticism and Animal Faith* (1923) and his "Preface to a System of Philosophy" (*Yale Review*, 1924) show him replacing the immutable and eternal Platonic essences with relativistic knowledge, postulated by human faith and according to human needs.

His other works since 1914 include *Egotism in German Philosophy* (1916); *Character and*

Opinion in the United States (1920); a collection of *Soliloquies in England* (1922); *Dialogues in Limbo* (1925); *Winds of Doctrine* (1926); *Platonism and the Spiritual Life* (1927); and *The Realm of Essence* (1928). In 1923 he published his selected and revised *Poems*.

SANTO DOMINGO, sän'tô dô-mîn'gô, (DOMINICAN REPUBLIC). A West Indian state occupying the eastern part of the island of Haiti. The area is estimated at 19,332 square miles. The population in 1928 was 1,022,485, by the census of 1921, it was put at 897,405. The city of Santo Domingo, the capital, had 30,957 inhabitants. Agriculture and cattle-raising are the chief interests of the population. Sugar estates are to be found in the southern part of the country; tobacco, cacao, and coffee are grown in the other sections. Sugar production in 1927-28 totaled 412,380 short tons. The cacao yield in 1927 was 26,000,000 kilos. There is a great variety of minerals, the chief being gold and silver, but few are worked. In 1913 the total trade was valued at \$19,741,000; in 1920 it reached the high figure of \$105,257,117. In the succeeding years, it declined, falling to \$45,199,375 in 1921 and \$29,548,852 in 1922, but rose again to \$58,962,000 in 1927. Trade in 1928 totaled \$55,542,468, of which \$26,787,940 represented imports and \$28,754,528, exports. The year 1921 was the only one in the period to show an adverse trade balance for the Republic. The preponderating share of the country's foreign trade fell to the United States. Exports from Santo Domingo to the United States for 1920, 1921, and 1928 were respectively 87 per cent, 77 per cent, and 226 per cent of the total. The last figure was occasioned by the small purchases of Dominican sugar because of the tariff and prevailing low prices. In 1921 and 1928, American imports into Santo Domingo totaled 84 and 61.12 per cent of the whole. Sugar and cacao are the leading exports. There were in 1929 about 149 miles of railway of which 62 miles belong to the Government. Revenues and expenditures for 1913-14 were \$5,035,250 and \$4,890,216, for 1928, \$12,565,400 and \$12,172,829. The bonded debt of the country, on Dec. 31, 1928, stood at \$19,820,000. Defense is in the hands of a native constabulary of 3000 officers and men. The American military occupation inaugurated in 1916 was terminated in 1924 upon the adoption of a new constitution and the inauguration of President Vasquez.

History. The much-needed internal peace which was to result from the American-Dominican fiscal treaty of 1907 came to a premature end with the assassination of President Ramon Caceres in 1911. Thereafter each year saw a new revolution and a new president. President Boidas, who had been elected in April, 1913, encountered a strong rebellion in the spring of 1914. When the situation had become a hopeless tangle in the late summer, matters were straightened out with the assistance of an American commission which had been sent to Santo Domingo for this special purpose. Boidas was induced to resign and Dr. Ramon Baez, the son of a former president, was elected provisional president on Aug. 27, 1914. In October of the same year ex-President Juan Isidro Jimenez was chosen constitutional president. A new revolution broke out under General Arias, a chronic revolutionist of Monte Christi, early in 1916. When Arias seemed

on the point of seizing the government, the United States, which by this time had grown thoroughly impatient with the interminable civil disorders and their attendant destruction of life and property and harm to American and other foreign interests and had become alarmed by the danger of international complications, landed marines and took control in Santo Domingo.

President Jimenez, who had approved American intervention but had become dismayed at the turn of affairs, resigned on May 6, 1916, and left the country, while General Arias was summarily ousted by the American commander. The complete pacification of the interior by the American forces was rapid and without serious opposition from the native population. On July 25, the Dominican Congress chose as temporary president Dr. Francisco Hernandez Carvajal, a man of outstanding ability and character. In view of the failure of the 1907 treaty to ensure peace and the security of property, the United States decided to exact guarantees against the recurrence of disorders in the future and hence made its recognition of Henriquez contingent on the conclusion of a new American-Dominican treaty modeled after the treaty signed between Haiti and the United States in 1915. The principal features of the new treaty were to be provisions for the collection of customs under American supervision, the appointment of an American financial adviser, and the installation of a constabulary force officered by Americans. On the refusal of President Henriquez to accede to this request, on the ground that the proposed treaty constituted a flagrant infringement of the sovereignty of the Dominican Republic, the American authorities proceeded to compel compliance by withholding all Dominican revenues from the government. This brought about complete paralysis of the whole governmental machinery. When it became apparent that President Henriquez intended to stand for reelection at the expiration of his temporary term, with good prospects of success, the existing deadlock threatened to continue for an indefinite period. To end an impossible situation the American commander issued a proclamation declaring the Dominican Republic under the military administration of the United States. Immediately thereupon the military government took full possession of the country, and what little opposition there was met with rapid suppression.

During the American occupation, Santo Domingo enjoyed a wholesome quiet after the many years of internal disturbances, and a notable improvement was made in social and economic conditions. Most important among the many reforms were the construction of many miles of good roads, the enactment of new tax and revenue laws, the settlement of claims outstanding against the Dominican government, the creation of an efficient police force, the building of new schools, and the enforcement of strict sanitary regulations. Notwithstanding these obvious benefits, the Dominican people maintained their passive resistance and the spirit of resentment which they had manifested when they rallied around President Henriquez in 1916. The practical exclusion of the Dominicans from participation in the government, the overbearing conduct of many of the American military officers, the arbitrariness of the provost courts, alleged acts of cruelty and brutality on the part of American soldiers, all served to fan a spirit of violent resentment and opposition against the occupation. Off and

on, loud protests were voiced by the Dominicans against American intervention and the very considerable loan which they were pressed to float.

Evacuation of the Dominican Republic by the American forces was foreshadowed by the proclamation issued by the military government on Dec. 28, 1920, stating that "the time has arrived when it (the military government) may, with a due sense of its responsibility to the people of the Dominican Republic, inaugurate the simple process of its rapid withdrawal from the responsibilities assumed in connection with Dominican affairs." At the same time it was announced that a commission of representative Dominicans with a technical adviser would be appointed to prepare the constitutional amendments and to revise the laws of the Republic and that these laws, after approval by the military government, would be submitted to a constituent assembly and to the national congress. On June 14 a similar proclamation was issued, outlining the conditions under which the withdrawal would be made. After a long delay due to the refusal of the Dominicans to accept the American conditions, an American-Dominican accord was signed on June 30, 1922, which, aside from the establishment of a provisional government, stipulated that a treaty should be concluded between the United States and the new Dominican government, whereby the latter should recognize the validity of all acts of the American military government during the occupation, of the bond issues of 1918 and 1922, and of the convention of 1907, the latter to remain in effect for the time during which the 1918 and 1922 bond issues remained unpaid. Pending the establishment of a permanent government, Juan Bautista Vicini Burgos assumed office as provisional president on Oct. 21, 1922. Subsequently Gen. Horatio Vasquez, who was perhaps the outstanding figure in Dominican political life, was elected president, in accordance with a new constitution adopted June 13, 1924. On June 26, 1924, the Dominican Congress ratified the treaty with the United States which provided for the withdrawal of the American forces, and on July 12 the American troops were evacuated.

On the same date General Vasquez was inaugurated. At the end of September, 1924, an agreement for unconditional "most-favored-nation" treatment with respect to customs duties and other commercial charges was made between the United States and the Dominican Republic. In the same month the latter republic applied for membership in the League of Nations. The United States Senate, in January, 1925, ratified the treaties with Santo Domingo providing for the termination of the American occupation and the refunding of the Dominican debt of \$25,000,000. Under the second treaty the President of the United States appointed a receiver of customs to serve until the retirement of all external refunding bonds.

Despite protests of the opposition party, a revised constitution of the republic, proclaimed June 16, 1927, extended the terms of President Vasquez, Vice President Velazquez, and the members of Congress from 1928 to 1930. In January, 1929, a treaty was signed fixing the boundary between the Dominican Republic and Haiti and on March 11 the Dominican Congress ratified an arbitration treaty negotiated with Haiti. At the invitation of President Vasquez a commission of American financial experts, headed by former Vice President Charles G. Dawes, arrived in

Santo Domingo Apr. 2, 1929, for the purpose of working out a scientific budget system and recommending methods of improving the administrative organization of the republic. The mission departed April 23, leaving its report with President Vasquez. The report contained in codified form, ready for enactment, a budget law with provision for executive control of expenditures; an accounting law, a law regulating projected public improvements; a modified law of finance, and the necessary repealing laws. Certain changes in departmental organization were also recommended. The deficit at the beginning of 1929 was \$1,631,277, which had accumulated since 1924 at the rate of \$408,000 annually. General Dawes pointed out that appropriations under the 1929 budget would probably exceed the budget income for the year by approximately \$4,127,000. The total indebtedness of the republic, both internal and external, was placed at \$22,650,000. The opposition party, which was at first suspicious of the purposes of the Dawes Mission, later announced its unqualified indorsement of the plan.

Plans for the erection of a great lighthouse at Santo Domingo City as a memorial to Columbus were carried forward under the sponsorship of the Pan American Union during the latter part of the period 1914-29. In September, 1928, it was announced that 1091 architects from fifty-eight nations and territorial divisions had entered the competition for architectural plans.

SARAWAK. See STRAITS SETTLEMENTS.

SARGENT, CHARLES SPRAGUE (1841-1927). An American arboriculturist (see VOL. XX). As director of the Arnold Arboretum, Dr Sargent had a world-wide reputation. He was regarded as the foremost dendrologist in America and introduced many plants to the North Temperate Zone. He received medals from the Garden Club of America (1920), from the American Genetic Association (1923), and the Loder Rhododendron Cup from the British Horticultural Society. He contributed biographical notes to *Epes Sargent of Gloucester and His Descendants* (1923).

SARGENT, JOHN GARIBALDI (1860-). An American lawyer and cabinet officer, who was born at Ludlow, Vt., and graduated from Tufts College. Having been admitted to the Vermont bar, he served as Secretary of Civil and Military Affairs of that State (1900-02) and as Attorney General (1908-12). In 1925 President Coolidge appointed him Attorney General of the United States, and he continued in that office until March, 1929.

SARGENT, JOHN SINGER (1856-1925). An Anglo-American artist (see VOL. XX). His portrait of Henry James was one of the paintings attacked by the suffragettes in London in 1914. The third series of his mural decorations in the Boston Public Library, finished in 1916, was entitled "The Theme of the Madonna." These paintings were objected to by members of the religious denominations figuring in the allegory and the removal of some was asked. He made several paintings of scenes on the western front during the World War. His large picture, "Gassed," in the Royal Academy, attracted great attention. In November, 1921, his decorations in the rotunda of the Boston Museum of Fine Arts were unveiled.

SARMENT, JEAN (1897-). A French playwright and actor who was born at Nantes and educated at the lycée there. His characters were mild romantics presented with delight-

fully charming humor His first play, *La Couronne de carton* (1920), was crowned by the academy. It was followed—the dates are those of presentation in Paris—by *Le Pêcheur d'ombres* (1921); *Le Mariage d'Hamlet* (1922); *Je suis trop grand pour moi*, produced at the Comédie Française (1924); *Madlon* (1925); *Les plus beaux yeux du monde* (1926); *As-tu du cœur?* (1926), and *Léopold le bien aimé* (1927). M. Sarment acted in many of these, as well as in other plays, and in 1917 he played in New York. In 1922 he published *Le Cœur d'enfance*, a volume of poems.

SARRAIL, sà'ra'y', MAURICE (1856–1929). A French general (see VOL. XX). At the beginning of the World War, he commanded the 6th Corps, and on Sept. 2, 1914, was appointed commander of the 3d Army. At Verdun, although authorized and even commanded to fall back, he held his army on the northwestern front, which helped to make Joffre's counter-attack at the Marne possible. In December, 1915, he became commander-in-chief of all the Allied forces in the East, but was recalled to France in 1917 and was put on the reserve list as having reached the age limit. Soon after the end of the War, he published an account of the Saloniki operations, under the title, *Mon Commandement en Orient*. In 1924 he was appointed High Commissioner in Syria. He was recalled in October, 1925, after serious native outbreaks which were attributed to the severity of his administration. His attempt to quell an outbreak in Damascus by bombarding the Arab quarter of the city aroused a world-wide protest (See SYRIA.) He died Mar. 23, 1929, and was buried at state expense in the Invalides.

SARRAUT, sà'rô, ALBERT (1872–). A colonial administrator and public official, who was born in Bordeaux and studied for a journalistic career. He entered the Chamber of Deputies as a Radical Socialist member in 1902, became Undersecretary for the Interior in 1906 and later for War, served as governor general of Indo-China (1911–14), and as Minister for Colonies (1920–24). During 1925–26 he was the French plenipotentiary in Angora. In the latter year he was elected Senator and appointed Minister of Interior, a post which he filled until November, 1928. He wrote *Le gouvernement direct en France* (1899) and *La mise en valeur de colonies* (1922).

SARTORIUS VON WALTERSHAUSEN, AUGUST, BARON (1852–). A German economist (see VOL. XX). He resigned his professorship at Strassburg in 1918. He published *Der Paragraph 11 des Frankfurter Friedens* (1915); *Weltwirtschaft und Weltkrieg* (1915); *Deutschland und die Weltwirtschaft nach dem Kriege* (1922); *Deutschlands Wirtschaftsgeschichte, 1815–1914* (1920), *Einführung in das Studium der Volkswirtschaft* (1923); *Die Weltwirtschaft und das staatlich geordnete Verkehrsessen* (1926); and *Weltwirtschaft und Weltanschauung* (1927).

SASKATCHEWAN. A Canadian province, with an area of 251,700 square miles, and a population in 1926 of 820,738, as compared with 757,510 in 1921, an increase of 63,228. The 1921 figure was a gain of 265,078 or 53.8 per cent over the figures for 1911. Of the population in 1921, 538,552 (71.1 per cent) lived in rural districts and 218,958 in urban. In 1921 males numbered 413,700 and females 343,810. The esti-

mated population in 1929 was 866,700. There were considerable colonies of Germans, Austrians, Scandinavians, Russians, and Dutch. Populations of the larger towns in 1926 were: Regina, the capital, 37,329; Moose Jaw, 19,039; Saskatoon, 31,234; Prince Albert, 7873.

Industry. Because of the prairie nature of the country, agriculture is the leading occupation. By 1927 the acreage devoted to wheat had increased to 12,979,279 acres from the 5,720,000 acres in 1912. Saskatchewan is the leading wheat-producing Province. The acreage under oats, barley, rye, and potatoes also have doubled since 1912. As a result of the diversified farming practiced and the attention given to root crops, etc., the live-stock industry is thriving. In 1926 there were 497,572 milch cows (20,624 in 1914), 922,373 other cattle (474,436 in 1914), 133,000 sheep (126,027 in 1914), 599,001 swine (454,703 in 1914). The value of agricultural products for 1926 was \$364,840,000, as follows: field crops, \$313,318,000; dairy products, \$18,873,000 (compare the 1910 products of \$381,809); wool clip, \$142,000; game and furs, \$40,000; garden products, \$2,452,000; poultry and products, \$10,954,000. Under the spur of an enlightened self-interest, farmer organizations have applied themselves to cooperative grazing schemes and cooperative elevators. In 1927, 929 elevators handled a total of 84,997,400 bushels of all grains. Other industries yielded: fish catch (1926), \$444,288, coal (1927), \$1,668,000. In 1926, there were 674 industrial establishments, concerning themselves primarily with milling and building operations, capitalized at \$33,943,060 and adding to products by manufacture, \$17,980,062. Employees numbered 4904, salaries and wages paid, \$6,397,545. The water-power resources were estimated at 542,000 horse power, but by 1928 only 35 horse power of this had been utilized.

Trade and Communications. Animal products and grains are the Province's leading exports. Exports for 1926–27 amounted to \$9,849,274, imports, \$20,700,339. In 1927 there were 7358 miles of railway in operation, as compared with 5654 miles in 1914.

Government. Revenues for 1926–27 totaled \$13,050,217, as compared with \$4,668,754 in 1913; expenditures for 1913 and 1926–27 were \$4,656,800 and \$12,962,217. In 1926 in the 4721 elementary and secondary schools, 206,560 pupils were enrolled (99,109 pupils in 1913). Total expenditures for education in 1913, \$8,787,904; in 1926, \$15,500,477. The provincial representation in the Dominion Senate is 6; in the House of Commons, 21. For 1925–26 receipts from the Dominion government (subsidy and school lands) amounted to \$2,835,659. Women received the franchise in 1916 and were made eligible for election to the provincial legislature.

SASSOON, SIEGFRIED (1886–). A British author and poet. During the World War, he served with the British forces in France and Palestine. He wrote *The Old Huntsman* (1917); *Counterattack* (1918); *Collected War Poems* (1919); *Satirical Poems* (1926); *The Heart's Journey*, poems (1928); and *Memoirs of a Fox Hunting Man* (1929), which won the Hawthornden Prize.

SATELLITES. See ASTRONOMY.

SATIE, ERIK (1866–1925). A French composer, born at Honfleur, France. Although he received musical instruction from the age of

eight, and had good teachers, he neglected his opportunities. After leaving the Paris Conservatory, where he was regarded as hopeless, he played in various cabarets in Montmartre until about 1890. He then met Josephin Péladan, a writer and leader of a mystic cult, the Salon de la Rose-Croix, which he joined in 1892. The next two years he spent writing incidental music for the plays of Péladan and other members of the salon, and thus began to realize the inadequacy of his technical equipment. He entered the Schola Cantorum, and nothing was heard of him until 1911, when Ravel played some of his piano pieces. Satie began as an extreme impressionist and rapidly drifted into Futurism. He wrote mainly for piano, his works being as eccentric and extravagant as their titles (e.g., *Aperçus Désagréables*, *En Forme de Poire*, *Pièces Froides*, etc.). He also wrote the ballets, *Upsud*, *Quadrille*, *Le Piège de Méduse*, *Parade*, *Mercur*, and *Relâche*, two orchestral suites, *Le Songe d'une Nuit d'Été* and *En Habit de Cheval*; and a marionette opera, *Geneviève de Brabant* (Paris, 1926).

SATURN. See PHYSICS.

SAUD, IBN. See IBN SAUD.

SAUERBRUCH, zou'ei-bröök', FERDINAND (1875-). A German pioneer in thoracic surgery through his invention of the pneumatic operating cabinet which makes possible the opening of the thoracic cavity without collapse of the lung. Born in Barmen, Prussia, he was graduated in medicine at Leipzig and became an assistant to Mikulicz at the University of Breslau and later professor of surgery in both German and Swiss universities. He first published the description of his cabinet in book form in 1911 in *Technik der Thoraxchirurgie* (written in collaboration with E. D. Schumacher). In 1920 and 1925, he brought out a two-volume work, *Die Chirurgie der Brustorgane* which incorporated the earlier work. Another subject in which he has always been interested is practicable artificial limbs and in 1916 appeared *Die willkürliche bewegbare künstliche Hand*.

SAULT SAINTE MARIE, CANALS AT In 1914 the United States St. Mary's Falls Canal had its facilities increased by the completion of a third lock, known as the Davis Lock, which was opened to commerce on October 21. This lock was 1350 feet in length between gates, with a usable length of 1300 feet, and had a width of 80 feet and a minimum depth of 24.5 feet over the sill. It was a part of a new separate canal on the American side with a width of 260 to 300 feet and by its increased depth made it unnecessary for the heaviest draft vessels to use the Canadian canal as was previously sometimes required, for there was only about 18½ feet at low water through the Poe or second American Lock. The new canal was crossed by a long bascule bridge carrying a railway track. Another feature of this canal was a fourth lock, of the same dimensions as the third. This fourth or Sabin Lock, named for the general manager of the canal, L. C. Sabin, was completed after various delays due to the War and opened to traffic on Sept. 18, 1919. It is operated by electricity and but 8 minutes are required to raise or lower the craft in the lock a distance of 20 feet. Two of the largest lake freighters can be accommodated tandem on these long locks. In 1916 a record was made of 25,407 vessels with a registered net tonnage of 69,824,463 passing

through the American and Canadian canals with a total of 91,888,219 tons of freight. This record can be compared with the statistics for 1923 when 21,975 vessels passed through the canals with a net tonnage of 68,546,412 and 91,379,658 tons of freight. In 1928 the traffic through the canals consisted of 19,286 vessels with a total registered tonnage of 66,835,763, and freight aggregating 86,992,997 tons.

SAUVEUR, ALBERT (1863-). An American metallurgist (see Vol. XX). He was metallurgist attached to the American Aviation Commission in France during 1917-19 and was appointed metallurgical expert to the French Ministry of Munitions in 1917. He became Gordon McKay professor of metallurgy at Harvard in 1924 and the same year was one of the United States delegates to the Third Pan-American Scientific Congress at Lima, Peru, and Bessemer medalist of the British Iron and Steel Institute.

SAVINKOV, BORIS (1879-1925). A Russian political agitator, successively a Marxist, a Terrorist, a leader of the Social-Revolutionary Party, an assistant War Minister under Kerensky, a member of the Kornilov revolt against Kerensky, and an active opponent of the Soviet régime. In his work against the Bolsheviks, he secured financial aid from many countries, and carried on most of his work in Poland. In August, 1924, he went into Russia, was recognized, arrested, and sentenced to 10 years in prison. Under the pseudonym of Ropshin, he wrote three novels: *The Pale Horse* (1907), *What Never Happened* (1912), both translated into English in 1917, and *Das Schwarze Ross*, about the 1917 revolution and its results. These were interesting and finished novels, both in material and style, the latter having been compared with that of Tolstoy.

SAVOY, UPPER See SWITZERLAND.

SAWYER, ROLAND DOUGLAS (1874-). An American clergyman, born at Kensington, N. H., and educated at Boston University. Besides his ministerial duties, he conducted a crusade against profanity during 1902-07, and organized the Anti-Profanity League. He was also active in Socialist politics, lectured for the Socialist Party, and was Socialist candidate for governor of Massachusetts in 1912. He was elected to the Massachusetts Legislature on the Democratic ticket in 1914 and was reelected till 1928. He was a delegate to the Massachusetts Constitutional Convention of 1917-19. His writings include *The Making of a Socialist* (1911), *Social Science of Jesus* (1912); *Walt Whitman, the Prophet Poet* (1913); *'Neath Swaying Pines* (1916); *Thorau, New England Philosopher* (1917); *The Great Teachers of Wisdom and Virtue* (1920); *Cal. Coolidge, President* (1924).

SAXONY, sāk'sūn-ī. One of the constituent republics of the German Reich, with an area of 5786 square miles and a population (census of 1925) of 4,994,281. The internal situation in Saxony remained comparatively calm during the first years of the World War. In 1917, however, it assumed a disquieting aspect, and a strong movement for internal reform and an early peace began. It accumulated force during the following year and brought about the fall of the government in October, 1918. The career of the succeeding government, the Heinze ministry, was cut short by the November revolution, in the course of which King Friedrich

August abdicated and a republic was proclaimed. During the confusion of the early revolutionary period, the government was in the hands of People's Commissioners representing the extreme Socialists, but after the disturbances and upheavals of January, 1919, the reins of government were taken over by the Majority Socialists. Serious Communist risings occurred throughout Saxony and especially in the Vogtland. The Reichswehr had to be called in several times in 1919 and 1920 to reestablish the authority of the Dresden government. At the time of the Kapp Putsch in 1920, the ministry, consisting, since October, 1919, of a coalition of Majority Socialists and Democrats, was replaced by a coalition of the two Socialist parties. A new constitution was adopted on Oct. 26, 1920, and in accordance with its provisions elections for the Diet were held during the following month, which cut the representation of the Majority Socialists by nearly one-half. In consequence of their increased representation, the bourgeois groups were able to maintain a vigorous parliamentary opposition against the Socialist government.

After a period of comparative calm in 1921 and 1922, "Red Saxony" came once more into prominence in the fall of 1923, at a time when the Reich was in a very critical situation and reaction and monarchism were rampant in the neighboring state of Bavaria. Ostensibly as a counter-movement against the peril of Bavarian Nationalism, the Socialists received avowed Communists into the cabinet and "Proletarian Hundreds" were organized to fight reaction. This action soon brought the Saxon Prime Minister, Dr. Zeigner, into conflict with the Reichswehr and the Minister of National Defense for the Reich. When the Saxon Minister of Finance, Dr. Bottecher, an active Communist, called on the "Proletarian Hundreds" to arm, the government of the Reich decided to take action. The commander of the Reichswehr in Saxony demanded from Dr. Zeigner the dismissal of the Communist ministers and the submission of Saxony to the authority of the Reich. Upon the refusal of the Saxon Premier to comply with these demands, the Reichswehr marched into Saxony on Oct. 22, 1923, and the whole Zeigner ministry was dismissed. The central government installed thereupon a moderate Socialist ministry under the leadership of Herr Heldt. He was reelected on Jan. 11, 1927. See GERMANY, under *History*.

SAYLER, OLIVER MARTIN (1887-). An American dramatic critic, born in Huntington, Ind. He was graduated from Oberlin College, Ohio, in 1909, and during 1909-20 worked on the *Indianapolis News*. After 1915 he was correspondent for the *Boston Evening Transcript*. He studied the theatres of Europe and gave extended lectures on Russia and on the theatre. He is the author of *Russia, White or Red* (1919); *The Russian Theatre under the Revolution* (1920); *Our American Theatre* (1923); *The Russian Players in America* (1923); *Inside the Moscow Art Theatre* (1925). He has also edited several series of plays.

SAZANOV, SERGIUS DMITRIEVITCH (1866-1927). A Russian statesman who was educated at the Alexandrovsky Lycée, and entered diplomacy. In 1894 he was secretary to the Vatican Mission, and in 1906 Minister to the Vatican, but it was in Great Britain, when counselor of the Embassy (1904-05), and acting chargé,

that he showed his ability in handling the Dogger Bank incident. In 1909 he returned to St. Petersburg to be under-secretary at the foreign office, and in 1910 he became Foreign Minister. He was an important factor in forming the Entente and in the negotiations immediately preceding the outbreak of the World War, and was one of the few reactionaries in Russia who urged fighting the War to a finish. At the outbreak of the War, the Poles had been promised home rule, and Sazanov wished to make good this promise, but as the Government would not hear of this, he was dismissed in 1915. Shortly before the revolution of March, 1917, he was appointed Ambassador to London, but conditions made it impossible for him to go. During the efforts to reconquer Russia from the Bolsheviks, he was Foreign Minister to Kolchak and diplomatic counselor in Ekaterinodar. When these efforts failed he spent a year in Prague, and then went to France. He was forced to live on the brink of poverty, which broke his health. He wrote his reminiscences which were translated into English as *Fateful Years, 1909-1916*, in 1928.

SCANDINAVIAN LITERATURE. Danish. Jóhann Sigurðsson, who died in 1919, held the foremost rank among twentieth-century Danish-Icelandic dramatists. His plays, based on native history and legend, show a strong love for Icelandic nature and character, both of saga and of contemporary times. Henri Nathansen was generally considered the greatest Danish dramatist of the day. One of his favorite themes is the contrast between Jew and Gentile. Einar Christiansen writes somewhat in the manner of Ibsen. Like Otto Benzon, he often portrays the conflict between the old and the new.

Among the poets, Ludvig Holstein, although a lyricist, usually conceals his own personality. His poetry often expresses a love for nature, particularly spring. Johannes Jørgensen was considered by some the greatest living Danish poet. A Catholic convert, he gives expression in his poetry as well as in his prose to his soul experiences and religious sentiments. L. C. Nielsen was attempting to create a modern national poetry. He is the writer of a number of cantatas of great power and is the interpreter of the lonely, the wanderer, and the lover. In the poetry of Kai Hoffmann is seen a love for life and for everything living. Olaf Hansen's is largely a poetry of reminiscence. Other poets of note are Sophus Claussen and Thøger Larsen.

Danish fiction suffered a great loss in the death of Jakob Knudsen in 1917. Johannes V. Jensen was one of the foremost writers of Denmark. Influenced at times by Walt Whitman, and a strong believer in the soundness of Northern life and tradition, Jensen became interested in a Gothic renaissance. In his later works (*Bræven, Norne-Gæst, Kongens Fald*), he pictures Danish life, particularly from Viking times. Otto Rung is characterized by his clear and firm thinking, his original interpretation of human nature, his thrilling action, and his subtle psychology. A writer touching on social conditions is Henrik Pontoppidan. He does not preach; yet his sympathies are clearly with the under class. His series, *De Dødes Rige*, beginning with *Torben og Jytte* and ending with *Favengholm*, portrays different phases of the struggle between the people and their oppressors, while *Mans Himmerig* shows a

generally pessimistic outlook on life. Martin Andersen Nexø is another writer interested in social problems. Among his later works may be mentioned *Ditte Menneskebarn*, a series treating the history of a family and constructed on large lines, and *Pelle Erobreren*, the story of a poor boy who grows up to be a leader of the workingmen. More strongly felt are the tendencies toward preaching a social gospel in the works of Jeppe Aakjær, whose *Hvor der er gærende Kræfter* may be interpreted as warning the leisure class against a possible rebellion of the peasants. In *Jens Langkniv*, Aakjær tries to portray in a single village the general history of Denmark. His stories usually centre around a character, a cause, or a view of life.

Karl Gjellerup, who died in 1919, was originally a theologian and then went over to a rationalistic view of life, to end up with an ethical-religious philosophy. In his novels, Gjellerup's learning often seems oppressive and distracts from his story. His *Den gyldne Gren* depicts the conflict between heathendom and Christianity. Knud Hjørthø finds his strength in his keen perceptions as a philologist and a psychologist. Of his later works may be mentioned the novels *Fru Herta* and *Trellys*, and the collection of short stories, *Ud for Skænten*. Of the Icelandic immigrants writing in Danish, the most important is Gunnar Gunnarsson, who shows vividly the disharmony, the gloom, and the passion of the soul-life of the Icelander, and also his lighter mood. Among his works are the series *Borgslægten*, *Larg i Væum*, *Edbrødre*, *Skibe paa Himmelen*, and *Den uerfælle Rejsende*.

Internationally recognized linguists are Otto Jespersen (English) and Kristoffer Nyrop (Romance). In the field of literary criticism should be mentioned Georg Brandes (died 1927), who in addition to Scandinavian has treated other literatures, ancient as well as modern, Vilhelm Andersen, and Valdemar Vedel.

Norwegian. Gunnar Heiberg was considered the greatest Norwegian dramatist of the period. His strength lies in the portrayal of strong sentiments and feelings. Another outstanding playwright was Hans E. Kinck (died 1926). The drama also received contributions from others whose chief work lies outside this field, such as Herman Vildenvey, Nils Kjør (died 1924), Vilhelm Krag, and Johan Bojer.

Norwegian poetry, even when written in Landsmaal, has retained many of the Danish characteristics and in general shows foreign influence. In spite, however, of its lack of a distinctly national character, it is very strong. In the period under review, foremost among lyric poets stood Olaf Bull, who expresses feelings for nature and love with exquisite tenderness, and Nils Collett Vogt, who is strongly subjective and whose *Hjemkomst* is his ripest and deepest poetry. Arnulf Øverland's verse is extremely personal. It expresses a feeling of revolt against things as they are and a grief over the nothingness of life. Other noted lyricists were Vilhelm Krag, the representative of neo-romanticism, and Knut Hamsun, whose main field, however, is the novel. Herman Vildenvey, who at first became popular because of his roguish humor, shows a deep seriousness and strong feeling in his later works, especially *Ildorkestret*. Among poets writing in Landsmaal were Olaf Aukrust, whose *Himmelvarden* is one of the best poems in Landsmaal literature, and Kristofer Uppdal, who comes nearest

to writing a national poetry and whose verse in general is free from the Danish characteristics noted above.

Hans E. Kinck was regarded by some as the most important Norwegian author of the period. At heart a romanticist, he was yet interested in the world of reality and its problems. In the field of fiction, his *Sneskavlen brast*, a novel built on very broad lines and strong in social psychology, is an epoch-making work. Nils Collett Vogt, besides being a novelist, is a dramatist and a poet. Johan Bojer, whose *Den store hunger* made him known internationally, upholds idealism against materialism and generally shows the victory of optimism over pessimism. O. E. Rølvaag attracted attention on both sides of the Atlantic by his portrayal of Norwegian immigrant life on the American frontier. His best works are *I de dage*, *Riket grundlægges*, and *Peder Seier*, all of which have been translated into English. Another novelist known outside of Norway is Knut Hamsun, whose *Markens grøde*, expressing the dream of an ideal state in nature, seems a reaction against the War. The best-known woman writer of the period was Sigrid Undset, whose *Kristin Lavransdatter* gives in three volumes the story from childhood to death of a fourteenth-century girl. Sigrid Undset is particularly interested in the problems of her own sex. The same is true of Barbra Ring, author of *Før kulden kommer*, *Under sejl*, *Søstre*, etc., who treats woman's side of married life and evinces a love for the soil and the agrarian class. Kristian Elster, in his works *Landeveien*, *Ilden*, *Guldet og de grønne skoger*, etc., protests against existing conditions and the prevailing philosophy of life. Among prominent novelists the outstanding are Gabriel Scott, Johan Fredrik Vinsnes, and Peter Egge, who is also a dramatist. Of Landsmaal writers we may note Oskar Braaten, who is particularly interested in life among the poorer classes, Kristoffer Uppdal, who even in his prose evinces strongly lyric tendencies; and Olaf Duun, who shows an intimate knowledge of peasant life.

Halvdan Koht is a scholarly writer on historical and literary subjects. Among literary critics of exceptional ability are Gerhard Gran (died 1925), Christen Collin, and Fredrik Paa-sche.

Swedish. The Swedish drama was not very strong during this period. The theatre drew largely on foreign and earlier Swedish playwrights. Among the best contemporary dramatists were Ernst Didring, Per Hallström, and Tor Hedberg, who excelled also in other fields of literature.

The greatest living Swedish poet is Verner von Heidenstam. He is an idealist, fond of portraying the conflict between good and evil, and interested in Swedish history and its heroes. Through his poetry breathes the spirit of patriotism, which is, however, largely an extension of his love for his birthplace. In addition to being a poet, Heidenstam wrote several novels, particularly on historical subjects; these antedated 1914. Bertil Malmberg's poetry, spontaneous and full of feeling, recalls the Gothic school and is often similar to Tegnér's. Among his works may be mentioned *Fru blodande jord*, *Orfika*. Bo Bergman's verse is exquisite in form, classical, clear and musical, and shows a strong lyric mood. Ragnar Jandel's verse expresses a seriousness and an idealistic long-

ing and positive religious conviction. Swedish lyric poetry was strongly represented in Finland. In this connection, four men were outstanding. Preeminent among these was Bertel Gripenberg, a portrayer of strong feelings, hate as well as love. His verses are full of the spirit of fight. Among his later works is the collection *Under fanan*, which was written under the inspiration of the civil war in Finland. Jacob Tegengren is deeply sensitive to nature, particularly to its aspects in spring and summer. He is quiet and dreamy, the melancholy of his earlier years having given way to a more joyful tone. Among his later poems may be noted *Ny vär*. Arvid Morne's poetry is often inspired by a love for his native place, its nature, and its people; but Morne is also an agitator, fighting now for this cause, now for that, this often gives his poetry an argumentative coloring. He has also shown ability in the drama and novel. Hjalmar Procopé (died 1927), the last of the Swedish writers in Finland to be mentioned here, had no definite philosophy of life. His poetry is quiet and characterized by a mild and mainly resignation.

The author who was considered by most critics the greatest living writer of Swedish fiction was Hjalmar Soderberg. The chief strain running through his works is pessimism. His irony and wit, as well as certain features of his technique, show French influence. Next in rank is Per Hallstrom, also a dramatist, whose works show a very strong power of imagination and keen psychological insight. Selma Lagerlof, who received the Nobel Prize for Literature in 1909, is an extremely popular author, well known also outside of Sweden. Her work is characterized by a rich imagination, a love for her native Province of Varmland, a strong power of storytelling and a wholesome moral tone. Best known of her works is *Gosta Berlings saga*. Some of her later works are *Bannlyst*, *Mårbacka*, and the Lowenskold series (*Den Lowenskoldska ringen*, *Charlotte Lowenskold*, and *Anna Skard*). K. G. Ossiannilsson, who is also a poet, is interested in the problems of society, particularly in class struggles. Marika Stjernstedt is interested in her own sex, especially in the strong, independent woman placed in contrast with her weak and submissive sister. Some of her late books are *En officershustru*; *Varlden och stjärnorna*, which pictures the attainment of peace through struggle, and *Proken Lwin*. Although Sigfrid Siwertz began as a disciple of Schopenhauer, his later works have shown a more or less pronounced influence of Bergson. Of these may be mentioned *De stora barnen*, *Eldens ätersken*, *Jonas och Draken*. Martin Koch is a writer with a social message. He shows strong sympathy for the lower classes, whose lives he likes to depict, as seen in *Guds räckra värld* and *Anteckningar på havet*. In religion, he favors an everyday practical faith rather than dogmatism and formalism. Elin Wagner generally has a thesis in her works, although in her later books she leans somewhat to the novel of character. Among these later works are *Helga Wisbeck*, *Den namnlösa*, which shows the influence of Strindberg and Dostoevski, and *De fem parlorna*. Henning Berger, who died in 1924, treated the emigrant to America in several of his stories. His characters usually have something of the legendary and, in general, his novels are permeated by a note of earnestness and melancholy. Tor Hedberg is one of the strong writers, not only of

fiction but also of drama, poetry, and criticism. Sven Lidman is interested in memories and traditions. Of his later works may be mentioned *Huset med de gamla fröknarna* and *Såsom genom eld*. Among humorists of popular fame are Albert Engstrom, whose humor and keen understanding of Swedish character made him a favorite with the people, and Hjalmar Bergman, whose *Markurells i Wadköping* carried him to the height of popularity.

Nathan Soderblom, the archbishop of Sweden, contributed to the subjects of religion, its origin, development, etc. Adolf Noreen, who died in 1925, had become internationally known for his linguistic investigations. Literary critics of note are Hendrik Schuck, Karl Warburg, John Landquist, Fredrik Book, and Martin Lamm.

SCAPA FLOW. A small body of water nearly enclosed by the Orkney Islands; about 14 miles long, varying from 3 to 8 miles in width. The principal channels leading out are through Hoy Sound into the Atlantic Ocean and through Holm Sound into the North Sea. Each is about 2 miles wide. The best anchorage is on the north coast of Hoy, but there are several others. Scapa is over 50 miles farther from the German coast than Rosyth, but the great ease of entrance and exit for a large fleet caused its use during the War as the operating base of the British Grand Fleet. It was in Scapa Flow that the surrendered German fleet was interned and where it was scuttled by its officers. See WAR IN EUROPE, *Naval Operations*.

SCARBOROUGH, GEORGE MOORE (1875-). An American playwright, born at Mt. Carmel, Tex., and educated at the University of Texas. From 1897 to 1905, he practiced law in Texas, then became a reporter for the *New York American*, and was with the Department of Justice from 1909 to 1914. His first play, *The Luc* (1913), attracted much attention. Among his other plays are *At Bay* (1913); *The Court of Last Resort* (1913); *What Is Love?* (1914); *The Heart of Wetona* (1916); *Moonlight and Honeyuckle* (1918); *The Son-Daughter* (1919); *Bluchonnet* (1920); *The Mad Dog* (1921); *Mrs. Hope's Husband* (1921); *The Trail* (1922).

SCARLET FEVER. In 1923 and 1924, more was learned of the intimate nature of this disease than within the previous 50 years. The labors of independently active researchers—Dick and Dick; Dochez, Sherman, and Blake; and Trask and Lynch—which were published in 1923 and 1924 in the *Journal of the American Medical Association*, all point to the same conclusions. Scarlet fever is due solely to a special strain of the hemolytic streptococcus, which flourishes only in the tissues of scarlet fever patients and possibly in so-called immune carriers. This organism is the cause alike of the disease and of its destructive complications. The disease is largely the result of an intoxication by the secretions arising from the bacterium, so that scarlet fever takes its place with those affections which can be reached by an antitoxin. From analogy, it should be possible to recognize those predisposed to the disease, to immunize against it, and to cure patients already infected, provided the antitoxin can be used seasonably. The conditions have been realized partly in the laboratory and in experimental work on volunteers.

Scarlet fever antitoxin, the skin test for susceptibility to the disease, and attempts at immunization have now been before the public of

the civilized world for several years and many favorable reports have been published concerning the specific influence of the first named on the temperature and fever curve of the disease in patients with medium and severe types of it, but there are still numerous criticisms of both the theory and the results in practice. Thus, most of the reporters are skeptical as to the power of the serum over the secondary complications of the disease, although a minority believe that these may often be prevented by timely injections. That the hemolytic streptococcus is the essential cause of the disease is questioned in some quarters and this also is true of the specific action of the serum, for other sera prepared from other strains of streptococcus are said to have the same power over the disease, just as the specific serum is said to be able to control other streptococcus diseases—erysipelas, for example. In regard to the susceptibility test and immunization of the susceptible, this resource has for some reason been suspended by some of the health offices.

SCHACHT, (HORACE GREELEY) HJALMAR (1877-). A German financier, born at Tingelst, Holstein. After studying finance and political economy he entered the banking business and in 1908-15 served as a director of the Deutsche Bank. Shortly after the German invasion of Belgium he was sent to Brussels where during 1914-15 he supervised the collection of the Belgian war indemnity. In 1916 he became director of the Nationalbank für Deutschland and a partner in the Darmstadter und Nationalbank, in November, 1923, commissioner of currency for the German Reich, and in December, 1923, president of the Reichsbank. In the latter capacity he participated in the deliberations of the Dawes Committee, the launching of the Reparations Loan of 1924, and the meeting of the Reparations Commission in January, 1929, which appointed the Committee of Experts, known as the Young Committee, to formulate a substitute for the Dawes Plan. He wrote *Die Stabilisierung der Mark* (1927), a discussion which was translated into English the same year as *The Stabilization of the Mark*.

SCHAFER, shā-fēr, DIETRICH (1845-1929). A German author and historian (see Vol. XX). During the World War, he was president of the Independent Committee for German Peace and afterward he was leader of the German Nationalism Union of Youth. Like most of the historians of his country, after 1914 his works dealt principally with the War and the problems of Germany. They include *Sein oder Nichtsein* (1914), *Deutschland und Frankreich* (1914), *Das Deutsche Volk und der Osten* (1915), *Staat und Volk* (1915), *Deutschland und England in See- und Weltgeltung* (1915), *Die Kultur und Ihre Aufgaben* (1917), *Die Vereinigten Staaten als Weltmacht* (1917), *Russland* (1918), *Wir Deutschen als Volk* (1918), *Wie wurden wir ein Volk? Wie können wir es bleiben?* (1919), *Ost Europa und die Deutschen* (1924), *Deutschland und Ausland* (1926), *Mein Leben* (1926).

SCHAFER, shā-fēr, WILHELM (1868-). A German poet, essayist, and short story writer, born in Ottau, Hesse-Nassau. A member of the Prussian Academy of Art, he has written *Die Halsbandgeschichte* (1910), *Karl Stauffers Lebensgang* (1912), *Lebensstag eines Menschenfreunds* (1915), *Die dreizehn Bücher der deutschen Seele* (1922), *Hölderlins Einklehr* (1923), *Winckelmanns Ende* (1925), and *Huldreich*

Zwingli (1927). *Anekdoten*, (1908), appeared in a new edition in 1929.

SCHAUFFLER, ROBERT HAVEN (1879-). An American author and lecturer. He was born at Brunn, Austria, of American parents and was brought as a child to the United States. He studied at Northwestern University and Princeton (A.B., 1902), and later at the University of Berlin. He was for one year music editor of the *Independent*, New York, and contributed to *Collier's Weekly*, the *Century*, *Outlook*, *Success*, the *Atlantic*, and the *Metropolitan Magazine*. In 1906 he was decorated by the Queen of Italy for winning the tennis championship of Italy (doubles). In the World War, he served as a first lieutenant with the 79th Division and was severely wounded in the Meuse-Argonne offensive. He is the author of *Where Speech Ends* (1906); *Romantic Germany* (1909); *The Musical Amateur* (1911); *Romantic America* (1913); *The Joyful Heart* (1914); *Fiddler's Luck* (1920); *Selected Poems* (1922); and *Peter Pantheism* (1925).

SCHIEDEMANN, PHILIPP (1865-). A German Socialist leader, born at Kassel. After attending the Burgerschule and the Realchule of his native town, he learned the printer's trade, and later became editor of a Socialist paper at Giessen and then of others at Nürnberg, Offenbach, and Kassel. In 1903 he was elected to the Reichstag, representing Solingen, and became a leader of the Social-Democratic Party. He supported the Government in its World War policy. In 1918 he was elected vice president of the Reichstag and was made Secretary of State without portfolio in October of that year. His party was said to have been willing that the monarchical form of government should be continued in Germany under a regency, but the Independent Socialists were determined on a republic; and their efforts were so successful that they were admitted in equal numbers in the provisional government. They denounced Scheidemann for his willingness to retain the services of reactionary officers and troops for the suppression of Communist disorders. When the National Constituent Assembly met at Weimar on Feb. 6, 1919, he was elected Vice President of the Republic and president of the Reichstag. After guiding the new Government through the troubles of the first half of 1919, he resigned on July 20, as he could not agree to the signing of the Treaty of Versailles. He took up again the leadership of the Majority Socialists in the National Assembly and afterward in the republican Reichstag. In 1920 he was elected chief burgomaster in his native town. He wrote *Der Zusammenbruch* (1921) and *Memorien eines Sozialdemokraten* (1928).

SCHELDIT RIVER CONTROVERSY. See NETHERLANDS.

SCHELER, shēl'ēr, MAX (1874-1928). A German philosopher and sociologist, who was born at Munich and died at Frankfurt. Educated at the Universities of Munich, Berlin, Heidelberg, and Jena, he became a professor at Munich. During 1917-18 he was at Geneva and The Hague as representative of the German Foreign Office. In 1919 he resumed his professorial career at Cologne University, going to Frankfurt in 1928. His works include *Die transzendental und die psychologische Methode* (1901); *Zur Phänomenologie der Sympathiegefühle* (1913, 2d ed., 1923, as *Wesen und Formen der Sympathie*);

Die Genus des Krieges und der deutsche Krieg (1915); *Der Formalismus in der Ethik und die materiale Wertheik* (1916); *Vom Umsturz der Werte* (1915); *Vom Ewigen im Menschen* (1921); *Schriften zur Soziologie und Weltanschauungslehre* (1923-24); *Zur Soziologie des Wissens* (1924); *Die Wissensformen und die Gesellschaft* (1926); *Die Stellung des Menschen im Kosmos* (1928).

SCHELLING, shĕl'ing, ERNEST (1876-). An American pianist and composer (see Vol. XX). During the World War, he was a captain with the American Expeditionary Forces. Since 1924 he has been conductor of the Saturday Morning Children's Concerts given by the New York Philharmonic Orchestra. The title of his variations for piano and orchestra is *Impressions from an Artist's Life*. He added to his list of compositions *Violin Concerto*, *A Victory Ball*, an orchestral fantasy; *Divertimento*, for piano and string orchestra, songs

SCHEPPEGRELL, WILLIAM (1860-). An American laryngologist and one of the world's authorities on hay fever. Born in Hanover, Germany, he was educated in the State College of South Carolina and after taking a medical degree settled in New Orleans in 1890. He began to write on hay fever in 1909 and published many articles on the subject, some of them in the United States government *Bulletins* (U. S. Public Health Service). He was for some years president of the Hay Fever Prevention Society, and has made numerous additions to the armamentarium of his special work, notably in connection with the use of electricity. His major writings are *Electricity in the Diagnosis and Treatment of Diseases of the Nose, Throat and Ear* (1898) and *Hay Fever and Asthma* (1922).

SCHICK, BELA (?-). A Hungarian bacteriologist and pediatricist known for his discovery of the special reaction to diphtheria toxin of children who are susceptible to the disease, which is now in general use throughout the civilized world by health officers. He also discovered the existence of a peculiar toxic substance in menstruating women termed by him menotoxin. Schick was formerly an assistant to the well-known Vienna pediatricists, Escherich and von Piquet. He has made numerous valuable contributions to periodical literature, but his major works are *Die Serumkrankheit*, von Piquet and Schick (1905), and *Scharlach*, Escherich and Schick (1912).

SCHICKELE, RENÉ (1883-). A German writer, born in Oberehnheim, Alsace. He wrote the novels *Der Fremde* (1907), *Benkel der Frauentröster* (1914); and *Das Erbe am Rhein* (3 vols, 1925, 1927, 1929), and the plays *Hans in Schnakenloch* (1915), *Am Glockenturm* (1919); *Die neuen Kerle* (1920).

SCHICK TEST. See DIPHTHERIA

SCHILLER, FERDINAND CANNAN SCOTT (1864-). An English philosopher (see Vol. XX). He continued to serve as tutor in Corpus Christi College, Oxford, until 1926 and was a fellow of that college and of the British Academy. His later publications include *Problems of Belief* (1924); *Tantalus, or the Future of Man; Psychology and Logic in Psychology and the Sciences* (1924); *Cassandra; or the Future of the British Empire* (1926); and *Eugenics and Politics* (1926).

SCHINDLER, shĭn-dlĕr, KURT (1882-). A German-American choral conductor, born in Berlin, Germany. He was trained in Berlin

under K. Ansorge (piano), L. Bussler, and F. Gernheim (composition), and studied under L. Thuille in Munich. From 1902 to 1903, he was conductor at the opera in Stuttgart, later in Würzburg, and from 1905 to 1907, was assistant conductor at the Metropolitan Opera House. In 1908, he founded in New York the MacDowell Chorus, which in 1910 became the Schola Cantorum. This organization introduced many important novelties. He resigned in 1926. In 1927 he became artistic director of the Musical Forum, whose concerts aim to bring to the attention of the public little known or neglected gems of folk music. Schindler is considered a specialist on folk music, of which he published several collections. His original compositions consist of about 50 songs and a choral ballad, *The Miracle of St. Raymond*.

SCHINZ, ALBERT (1870-). An American university professor and author. He was born at Neuchâtel, Switzerland, and studied at the universities of Neuchâtel (A B 1888), Berlin, Tübingen (Ph D, 1894), and Paris. Coming to the United States in 1897, he traveled and attended Clark University for one year, taught at the University of Minnesota, was professor of French literature at Bryn Mawr (1899-1913), held a similar chair at Smith College for 15 years, and since 1928 has been professor of modern French literature at the University of Pennsylvania. In 1928 he received an honorary LHD degree from Smith College. He is a Knight of the French Legion of Honor. He is author of *Anti-Pragmatism* (1909), *Roussseau, a Forerunner of Pragmatism* (1909); *La Question du Contrat Social* (1913), *French Literature of the Great War* (1919), and *Jean-Jacques Roussseau, interprétation nouvelle* (1928).

SCHIPA, TITO (1889-). An Italian operatic tenor, born at Lecce. His original ambition was to become a composer, and with this object he studied composition under Alceste Gerunda. The extraordinary success of his début as a singer, in Vercelli (1911) decided him to devote his talent to the stage, and in a few years he had sung at many of the important opera houses in Italy and won international reputation through appearances in Paris and London. In 1919 he made his American début as the Duke in *Rigoletto*, with the Chicago Opera Company (December 4), and since then has been a prime favorite. He had also made extensive tours of the United States as a concert singer.

SCHLAF, JOHANNES (1862-). A German writer and joint founder of the naturalistic school, known for the spiritual quality of his works. He studied at Magdeburg, Halle, and Berlin, and after his collaboration with Arno Holz in the naturalistic sketches, *Papa Hamlet* and *Neue Gelesse*, devoted himself mainly to theoretical and philosophical essays, particularly on Walt Whitman. He wrote the philosophical works: *Religion und Kosmos*, *Die geocentrische Tatsache* (1925); *Deutschland* (1926). *Die andere Dimension* (1926). He is also the author of the novels: *Das dritte Reich* (1900), *Aufstieg* (1910); *Die Wandlung* (1922), and several plays.

SCHLATTER, shlat'ĕr, ADOLF VON (1852-). A German theologian and author (see Vol. XX). He resigned his professorship at Tübingen in 1922. His recent publications include *Die Christliche Ethik* (1914); *Die Korinthische Theologie* (1914); *Die Märtyrer in den Anfängen der Kirche* (1915); *Die Beiden*

Schwerter (1916); *Luthers Deutung der Römerbriefe* (1917); *Die Entstehung der Beiträge zur Förderung der Christlichen Theologie* (1920); *Die Geschichte des Christus* (1921); *Erlebtes* (1924).

SCHLESINGER, ARTHUR MEIER (1888–). An American educator, born at Xenia, Ohio. He was graduated from the Ohio State University in 1900 and took postgraduate courses at Columbia. From 1911 to 1919, he was professor and assistant professor of history at Ohio State University; from 1919 to 1925, professor of history and head of the department of the State University of Iowa, and after 1925, professor of history at Harvard University. He was a member of many historical societies and wrote (with H. C. Hockett) *A Syllabus of United States History* (1915); *The Colonial Merchants and the American Revolution, 1763–1776* (1918); *Salmon Portland Chase* (1919); *New Viewpoints in American History* (1921); *Political and Social History of United States* (1925). Professor Schlesinger edited *Great Charters of Americanism* (1920), was also editor of the *State of Iowa Studies in Social Science*, and with Dixon Ryan Fox edited *A History of American Life* (1927–).

SCHLESWIG. This small duchy (area, 3385 square miles), wrested from Denmark by Prussia and Austria in the war of 1864 and annexed by Prussia in 1866, was one of the stakes of diplomacy at the Peace Conference of 1919. On Feb. 21, 1919, the Danish government placed the question of Schleswig before the Peace Conference. In the draft treaty submitted to the Germans in May, provision was made for the taking of a plebiscite in three zones, the third of which extended as far south as the Eider and the Schlei and was peopled largely by Germans whose social and cultural ties were clearly with the South. While the Germans naturally objected to the inclusion of this southern region in the plebiscite area, it was the weight of the arguments of the Danish Radical Party that succeeded in eliminating the third zone from the final treaty. Danes pointed out that the Germans in this district might be favorably disposed toward union with Denmark for economic reasons, viz., to escape heavy war taxes and the share of reparations, and that such a move would leave Denmark with a new irredentism. Articles 109–14 therefore mapped out two plebiscite zones: the northern running south of Tonder but north of Flensburg, and the southern taking in the area about Flensburg. Voting in the first zone on Feb. 10, 1920, gave a clear-cut majority for the Danes, 75,431 ballots being cast for Denmark and 25,329 for Germany. Tonder, in particular, being the centre of a Frisian population, gave a majority for Germany. Voting in the second zone took place on Mar. 14, 1920. Flensburg (population 63,000), the chief point of contention, was the scene of frequent clashes between the inhabitants and the French troops of occupation, and there were other disturbances. The final returns showed that 51,820 votes had been cast for Germany and only 12,793 for Denmark. Flensburg went German by three to one. In June, 1920, the Council of Ambassadors fixed the boundary between Denmark and Germany and details were settled in the next month by treaty between the two countries. Into North Schleswig (Danish Slesvig) the Danish currency was immediately introduced, and work was begun

on the reconstruction of highways and railroads. Questions of the rehabilitation of war veterans, the protection of German minorities (of whom there were 25,000 in the province), and frontier arrangements were amicably settled by treaty with Germany in 1922. Denmark assumed North Schleswig's share of the German reparation debt and under the Peace Treaty was obliged to pay 65,000,000 gold marks (\$15,500,000) to the reparation account for the properties of the Prussian state which had passed into her control. Danish Slesvig has an area of 1538 square miles and a population (census of 1921) of 163,622. By its acquisition, Denmark's area was increased by about 10 per cent and its population by 5 per cent. See DENMARK.

SCHLUMBERGER, JEAN (1877–). A French author who was one of the founders and directors of the *Nouvelle Revue Française*, which became the most important literary and critical monthly of Paris. He wrote the plays *On nait esclave*, with Tristan Bernard (1912); *Les Fils Louverné* (1914); and *La Mort de Sparte* (1921), both played at the Vieux Colombier theatre in Paris, and *L'Amour, le Prince, et la Vérité*, the novels, *L'Inquête paternelle* (1912); *Un Homme heureux* (1921), *Le Camarade infidèle*, and *Le Lion devenu vieux*, also *Épigrammes romaines*, *L'Enfant qui s'accuse*; *Césaire*, *Dialogues avec le corps endormi*; and *Les Yeux de dix-huit ans*, short stories (6 ed., 1928).

SCHMIDT, shmidt, OTTO ERNST (pseudonym, OTTO ERNST) (1862–1926). A German author (see VOL XX). He wrote novels, plays, and essays, of which the later ones include *Nietzsche, der Falsche Prophet* (1914), *Gewittersegen* (1915); *Semper der Mann*, a novel which continues the story of his hero in *Semper der Jungling*; *Das Glück ist immer da* (1916); *August Gutbier*, a satirical novel (1917); *Wer totet Seine Mutter?* (1918), *Mann der Arbeit, Aufgewacht!* (1918), *Freude-Freude* (1920), *Gesammelte Werke* (1922–23); *Heideide* (1923).

SCHMITT, shmitt, FLORENTE (1870–). A French composer, born at Blâmont, France. He began his musical studies at the Conservatory in Nancy, and in 1889–96 was at the Paris Conservatory, a pupil of Dubois, Lavignac, Fauré and Massenet. In 1897 he won the second Prix de Rome and in 1900, the first prize. From 1906 to 1921, he lived in Paris and devoted his entire time to composition. In 1921 he became director of the Conservatory at Lyons. In 1925 he won the Prix Chartier for chamber music. Although one of the foremost of impressionist composers, he does not sacrifice definite formal structure to mere atmosphere. He wrote an opera, *Antony et Cléopâtre* (Paris, 1920); three ballets, *La Tragédie de Salomé* (Paris, 1907), *Ouï-oui* (unproduced), and *La Petite Elfe Ferme Pêul* (Paris, 1922), the symphonic poems, *Le Palais Hanté*, *Sclamik* (for military band), *Combat de Rakshasas et Délivrance de Sita* (manuscript lost in the Paris flood of 1910), and *Rêves*, for orchestra, *En Été*, *Reflets d'Allemagne*, *Pupazzi*, and *Rapsodie Viennoise*, vocal with orchestra, *Sémiramis* (lyric scene), *Psalm 46*, *Chansons à Quatre Voix*, *Pendant la Tempête*, *Danse des Deradasis*, a considerable amount of chamber music; and fine works for piano (solo, four hands, and two pianos).

SCHNABEL, shna'bel, ARTHUR (1882–). An Austrian pianist, born at Lupnik, Carinthia. After receiving his first instruction from H. Schmitt, he studied with Leschetizky in Vienna

(1888-97). After that time, he made constant tours, chiefly of Austria and Germany. He visited the United States for the first time in 1921. In 1912, he made his home in Berlin, where he formed a trio, with A. Wittenberg (violin) and A. Hekking ('cello), and also appeared frequently as assisting artist with other chamber-music organizations. His joint recitals with Karl Flesch have for years been among the notable events of the Berlin musical season. In 1925 he was appointed professor of piano at the Staatshochschule für Musik in Berlin. As an eloquent interpreter of the classic and romantic masters, he is unsurpassed, while as a composer, beginning as a mild impressionist, he gradually drifted toward extreme futurism. In his latest piano pieces, written after the World War, he discards tonality, key-signatures, time-signatures and bar-lines.

SCHNEEVOIGT, GEORG (1872-). A distinguished Finnish conductor, born at Wiborg. After graduation from the Conservatory at Helsingfors, he continued to study the 'cello with Karl Schröder in Sondershausen (1890-92) and J. Klengel in Leipzig (1894-95). During 1892-94 he was solo 'cellist of the Helsingfors Philharmonic Orchestra, and made successful tours of Finland. Beginning with 1896, he spent the next four years in extended tours of Scandinavia, Germany, England, Belgium, Holland and Switzerland. He began his career as conductor in 1901, directing the symphony concerts at the Exposition in Riga. In 1904 he succeeded Weingartner as conductor of the Kaim Orchestra in Munich, and after its dissolution in 1908, returned to Riga, where the following year he organized the Riga Symphony Orchestra, which he directed for three years. In 1912 he established his own symphony orchestra in Helsingfors, which was amalgamated two years later with the Philharmonic Orchestra, while Schneevogt remained as conductor. During 1916-24 he lived in Stockholm as conductor of the Konsertförening, and during this period he appeared frequently as guest conductor in almost every country of Europe. During 1918-24 he also was the regular conductor of the summer concerts at Scheveningen. He made his first visit to the United States in 1924, when he appeared as guest with the Boston Symphony Orchestra. In 1924-25 he was general musical director in Düsseldorf. In 1927 he was elected conductor of the Philharmonic Orchestra in Los Angeles. His wife, Sigrid Sundgrén, whom he married in 1907, is a concert pianist, a pupil of the Helsingfors Conservatory.

SCHNEIDER, ALBERT (1863-1928). An American bacteriologist and pharmacologist, born at Granville, Ill. Having been graduated in medicine from the College of Physicians and Surgeons, Chicago, in 1887, he settled in California and in 1903 began to teach bacteriology, pharmacognosy and therapeutics in the university of that State, resigning in 1919 to assume the professorship of pharmacognosy in the College of Pharmacy at the University of Nebraska. While in California, he also took charge of the experimental station of the Spreckels Sugar Company (1906-07); was at the head of the department of pharmacognosy of the U. S. Department of Agriculture (1909-15), and was microanalyst of the State Food and Drug Laboratory (1915-19). From 1919 to 1921, he was professor of pharmacognosy at the University of Nebraska, and in 1922 became dean of the school

of pharmacy at North Pacific College, Portland, Oreg. His chief publications are *Pharmaceutical Bacteriology* (1912); *Pharmaceutical Plants and Their Culture* (1912); *Microbiology and Microanalysis of Foods* (1920); *Microanalysis of Powdered Vegetable Drugs* (1921); *Laboratory Pharmacology and Toxicology* (1925).

SCHNEIDER, EDWARD CHRISTIAN (1874-). An American physiologist born at Wapello, Iowa. He was educated at Tabor College (B.S., 1897) and at Yale (Ph.D., 1901). He was instructor in chemistry at Tabor (1897-99), professor of biology and physical chemistry (1901-03), and professor of biology (1903-19) at Colorado College, and professor of biology (1919-) at Wesleyan University. He was physiologist in the medical research laboratory at Mitchel Field Air Service.

SCHNEIDER, HERMAN (1872-). An American university president. He was born at Summit Hill, Pa., and graduated from Lehigh University. For three years he was engaged in structural iron work and later was on the engineering staff of the Oregon Short Line Railroad (1897-99). From 1899 to 1903, he was instructor in civil engineering at Lehigh University. Going to the University of Cincinnati in 1903 as assistant professor of civil engineering, he became full professor two years later, was dean of the College of Engineering from 1906 to 1919 and dean of the College of Engineering and Commerce from 1919 to 1929, when he was elected president of the university. He originated the cooperative system of technical education. In the World War, he was chief of the Industrial Service Section of the War Department, and member of the advisory board to the General Staff, U. S. Army, on education and special training. He is the author of *Education for Industrial Workers*, and *Arthur McQuaid, American*.

SCHNITZLER, shnits'ler, ARTHUR (1862-). An Austrian dramatist (see VOL. XX). During the World War and after it, many of his plays were translated into English and published in the United States, where they aroused much interest. *The Lonely Way*, translated in 1915, was highly considered. Other works made available to English readers were *The Hour of Recognition, a Comedy of Words* (1916); *Casanova's Homecoming* (1922); *Gallant Cassian* (a puppet play, 1922); *The Shepherd's Pipe, and Other Plays* (1922); *The Vast Domain* (1922); *Living Hours* (1923). He also published *Komodie der Verführung* (1924); *Fraulein Else*, a novel (1924); *Der gang zum Weiber* (1926); *Traumnovelle*, a novel (1926); *Spil im Morgengrauen*, a novel (1927); *Therese* (1928), published the same year in English translation; and *Rhapsody: A Dream Novel* (1928). *Schnitzler's Short Stories*, a collection, was published in New York in 1929.

SCHOFIELD, W(ALTER) ELMER (1867-). An American painter (see VOL. XX). He received the Temple Gold Medal of the Pennsylvania Academy of Fine Arts in 1914, the Altman Prize of \$1000 from the National Academy of Design in 1920, and the Mrs. Keith Spalding Prize of \$1000 in 1921. He enlisted in the British Army in 1915, became captain of artillery, and saw active service in France during the World War.

SCHOLZ, shölts, WILHELM VON (1874-). A German lyrical poet, novelist, and playwright, born in Berlin. In 1927-28 he served as chairman of the department of poetry in the Prussian

academy of learning. His plays include *Der Gast* (1900); *Der Jude von Konstanz* (1905); *Meroe* (1907); *Vertauschte Seelen* (1910); *Der Wellauf mit dem Schatten* (1921); and *Die Gläserne Frau* (1924). Other works are *Die Hauser* (1923); *Der Zufall, Eine Vorform des Schicksals* (1924); *Perpetua* (1926); *Das Jahr* (1927).

SCHOOLS. See EDUCATION IN THE UNITED STATES.

SCHOOLS OF AGRICULTURE. See AGRICULTURAL EDUCATION.

SCHOPFER, JEAN See ANET, CLAUDE.

SCHORR, shôr, FRIEDRICH (1888-) An Austrian dramatic baritone, born in Nagyvarad, Hungary. When he was only three years old, his parents moved to Vienna, where he received his academic education and later studied law. This he abandoned, when friends convinced him of the exceptional beauty of his voice, and placed himself under the tuition of Professor Robinson, in Vienna, and after less than one year of training made a sensationally successful debut as Wotan in *Die Walküre*, in Graz (1911). He was immediately engaged as a regular member and remained there five seasons. In 1916-18 he was at the Landestheater in Prague, and the next five years at the Cologne opera. Immediately after his engagement for the Deutsches Opernhaus in Berlin in 1923, he came with the entire company to the United States, where he made his American debut at the initial performance as Hans Sachs in *Die Meistersinger* (Baltimore, Jan. 21, 1923). With the same company, he returned for a second tour in the fall of the same year. In 1925 he became a regular member of the Metropolitan Opera House and one of the prime favorites of the public. As an interpreter of Wagner, especially in the rôle of Wotan, he ranks with the very greatest.

SCHREINER, GEORGE ABEL (1875-). An American author, born in Germany. He served in the Boer War on the side of the Boers, came to the United States in 1900, and was naturalized six years later. He was managing editor of the San Antonio (Tex.) *Light-Gazette* in 1912-13 and acted as war correspondent for the Associated Press in many countries. His writings include: *The Iron Ration* (1918), *La Déesse Allemande* (1918); *From Berlin to Bagdad* (1918), *The Craft Smelter* (1920); *Entente Diplomacy and the World*, with B. de Siebert (1921), *How America Decided the World War*, from the MS of General von Falkenhayn (1922), *Cables and Wireless* (1924).

SCHREKER, FRANZ (1878-). An Austrian composer, born in Monaco. He studied composition under Robert Fuchs in Vienna. As a composer, he first attracted attention in 1902, when the Vienna Gesellschaft der Musikfreunde brought out his *Psalm CXVII*, which was soon followed by works for orchestra. In 1911 Schreker founded the Philharmonic Chorus and the next year he was appointed professor of composition at the Vienna Conservatory. He held both positions until 1920, when he was called to Berlin as director of the Akademische Hochschule für Musik. His greatest successes he won with his operas, which, according to his admirers, represent the perfect union of word and music. As a matter of fact, Schreker is his own librettist, but far from a poet. His principal subject is the sex problem, presented in commonplace, often trivial and vulgar, language, but always with considerable theatrical effect. This predominant erotic element de-

termines the general character of his music, a strange mixture of romanticism, Italian verism, and many phases of the many manifestations of modernism. He has written the operas: *Der ferne Klang* (Frankfurt, 1912); *Das Spielwerk und die Prinzessin* (Vienna, 1913, condensed into one act as *Das Spielwerk*, Munich, 1920); *Die Gezeichneten* (Frankfurt, 1918); *Der Schatzgräber* (Frankfurt, 1920); *Irrelohe* (Cologne, 1924); *Der singende Teufel* (Berlin, 1928). His other works include three pantomimes, orchestral and choral works, and songs.

SCHRÖDER, shrë'dër, ALWIN (1855-1928). An American 'cellist (see Vol. XX). He severed his association with the Kneisel Quartet in 1907, and then lived a year in Frankfurt as solo 'cellist of the Museum Orchestra and professor at Hoch's Conservatory. Returning to Boston in 1908, he was a member of the Hess-Schröder Quartet, and again solo 'cellist of the Boston Symphony Orchestra in 1910-12 and in 1918-20. In 1915 he became 'cellist of the Boston String Quartet and of the Margulies Trio in New York. Although a superb virtuoso, he seldom appeared as a soloist, his absorbing passion being chamber music. As an ensemble player, he had no superior and but few equals.

SCHUCHARDT, shoo'art, HUGO (1842-1927). A German philologist and university professor (see Vol. XX). His later works included *Aus dem Herzen eines Romanisten* (1915); *Berberische Hiatusstilgung* (1916); *Zu der Romanischen Benennung der Milz* (1917); *Sprachverwandschaft* (1917); *Die Romanischen Lehnwörter im Berberischen* (1918); *Sprachursprung* (1919-20); *Sprachenbrevier* (1922).

SCHÜCK, shuk, JOHAN HENRIK EMIL (1855-). A Swedish historian (see Vol. XX), chairman of the Board of the Nobel Foundation and a member of the Swedish Academy. His later works include *Engelbrekt* (1916); *Shakespeare och hans tid* (2 vols., 1916); *Fran det forna Upsala* (1917); *En afventyrare* (1918); *Messenius* (1920); *Den svenska forlagsbokhandelns historia* (1923), and *Fran Campagna och Scran* (1926). He compiled vols. i, ii, and vi of the *Swedish National Literature, 1500-1920*, and edited *Ur Axel Reuterholms dagbok* (1921).

SCHÜCKING, shuk'ing, WALTHER (1875-). A German political leader and professor of law who was born in Munster and educated at the universities of Munich, Bonn, and Göttingen. He was professor of constitutional and international law at the University of Marburg (1903-21), at the Handelshochschule of Berlin (1921-27) and at the University of Kiel (1927-).

He was a member of the German delegation to the Paris Peace Conference in 1919, of the Permanent Court of Arbitration at The Hague, of the board of the Academy and Institute of International Law at The Hague, chairman of the German group of the Inter-Parliamentary Union, and since 1919 a representative of the Democratic Party in the Reichsrat. Among his many works are *Neue Ziele der staatlichen Entwicklung* (1913); *Der Weltfriedensbund* (1917); *Der Dauerfrieden* (1917); *Die völkerrechtliche Lehre des Weltkriegs* (1918); *Internationale Rechtsgarantien* (1918); *Das völkerrechtliche Institut der Vermittlung* (1923); *Garantiepakt und Rüstungsbeschränkung* (1924); *Das Genfer Protokoll* (1925). Many of his books have been translated.

SCHULZ, shults, LEO (1865-). A celebrated American 'cellist, born in Posen, Germany.

When only five years of age, he was exhibited in Germany as a prodigy, but later studied at the Königlische Hochschule in Berlin. In 1885 he was for one season solo 'cellist of the Berlin Philharmonic Orchestra, and during 1886-89 held a similar position with the famous Gewandhaus Orchestra in Leipzig. In 1889-98, while in Boston, he was solo 'cellist of the Boston Symphony Orchestra and professor at the New England Conservatory. In 1890 he joined the New York Philharmonic Orchestra as principal 'cellist, and filled that post with distinction until his retirement in 1929, with the exception of the two seasons 1906-08, when he was with the New York Symphony Orchestra. He also taught some years at the National Conservatory, and in 1904-15 was 'cellist of the Margulies Trio. Throughout his career, he was frequently heard as a soloist with orchestra.

SCHUMACHER, shōō'māg-ēr, HERMANN A. (MANDUS) (1868-). A German economist and writer on the science of government (see VOL. XX). His works after 1914 include: *Der Panama Kanal und Seine Bedeutung* (1914); *Deutschlands Stellung in der Weltwirtschaft* (1915); *Antwerpen, seine Weltstellung und Seine Bedeutung für das Deutsche Wirtschaftsleben, Belgiens Stellung in der Weltwirtschaft* (1916); *Der Deutsche und Belgische Wettbewerb und Seine Regelung* (1916); *Deutschland und Englands Finanzkrise* (1917); *Der Eisen in der Weltwirtschaft* (1917); *Gegenwartsfragen des Sozialismus* (1920); *Die Wohnungsfrage als volkswirtschaftliches Problem* (1921); *Das Problem der Internationalen Reichverschuldung* (1923); *Der Volkswort* (1927).

SCHURIG, ARTHUR (1870-1929). A German writer and critic. He was born at Dresden and studied at the universities of Leipzig and Berlin. He is the author of: *Wolfgang Amadeus Mozart* (1913); *Das Leben eines Sonderlings*, a life of Beyle-Standhal (1921); *Konstanze Mozart* (1922); *Franzisco Pizarro* (1922), two volumes of essays, *Anti-Tagore* (1921), and *Katechismus der Lebenskunst* (1922); the novels, *Seltene Liebesleute* (1913); and *Gottfried Butternvogel* (1923); *Tristan und Isolde in der britonischen Urgestalt* (1923); *Vom Glücke Beethoven* (1926); *Der vollkommene Spießbürger* (1927); *Die Legenden um Beethoven* (1927); and *Der goldene Ball* (1927). He also translated and edited works by Beyle, Flaubert, Julie de Lespinasse, J. G. Prod'homme, Balzac, Taine, and others.

SCHURMAN, JACOB GOULD (1854-). An American educator and diplomat (see VOL. XX). In 1915 he was first vice president of the New York State Constitutional Convention and in 1917-18 he served on the New York State Food Commission. In 1920 Dr. Schurman resigned the presidency of Cornell University. From 1921 to 1925, he served as United States Minister to China, and since June, 1925, has been Ambassador to Germany. In 1927 Heidelberg and Marburg universities conferred the honorary Ph.D. degree upon him. In the period after 1914, he was similarly honored by numerous other American, British, and German universities. He wrote *Why America Is in the War* (1917).

SCHUSTER, SIR ARTHUR (1851-). An English scientist and physicist (see VOL. XX). He was president of the British Association in 1915, secretary (1912-19), and foreign secretary (1920-24) of the Royal Society, and a member of the Cambridge University Commission (1923-

24). He was knighted in 1920. His later publications include *The Progress of Physics* (1911), and *Britain's Heritage of Science*, with the late Sir A. E. Shipley (1917).

SCHWAB, shwāb, CHARLES M. (1862-). An American capitalist (see VOL. XX). In April, 1918, at the request of President Wilson, he became director general of the Emergency Fleet Corporation, created for the purpose of producing sufficient ships to transport American troops to France. His energies and qualities of leadership greatly stimulated the work, which he continued to direct until December, 1918. Throughout the World War, the Bethlehem Steel Corporation, of which he was the head, was one of the principal sources of munitions and other war supplies for the Allies. For his service in this connection, Mr. Schwab was made an officer of the French Legion of Honor. He became an officer and director of numerous industrial corporations and served as president and director of the American Iron and Steel Institute, director of the Pan-American Society of the United States, and a trustee of Cornell and Lehigh universities and Pennsylvania State College. He received honorary degrees from New York University (1918), Stevens Institute (1921), the University of Pennsylvania (1927), and others. In 1928 he was awarded the Bessemer Prize for services to the steel industry.

SCIALOJA, VITTORIO (1856-). An Italian professor of law and public official, born in Turin. He became professor of law at the University of Camerino in 1879, at Siena in 1880, and at Rome in 1884. Elected a Senator in 1904, he served as Minister of Justice (1909-10), as Foreign Minister (1919-20), as member of the Italian delegation to the Paris Peace Conference, and as chief of the Italian delegations to the Locarno Conference and the sixth Assembly of the League of Nations. He also represented Italy on the League of Nations Council elected September, 1928, and was president of the Reale Accademia del Lincei.

SCIENCE, AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF. An organization founded in 1848 and incorporated in 1874. The membership increased from approximately 13,000 individuals in 1924 to over 17,300 in 1928; in the latter year, the membership also included 118 independent societies, of which 87 were affiliated with the association, 23 being local academies of science. The permanent endowment amounted to \$133,245.95 in 1924, and \$150,095.66 in 1928. Attendance at the annual meetings during that period varied from 1662 at Nashville, Tenn., in 1927, to about 5000 at the meeting in New York in 1928. At the larger gathering, 46 independent societies were represented and about 2200 papers and addresses were presented by about 1900 persons at the 250 sessions. A yearly prize of \$1000 is awarded for the most notable contribution to scientific knowledge, that of 1928 going to Dr. Oliver Kamm for his paper, "Hormones from the Pituitary Gland." Besides the standing committee of 100 to promote general research, the association finances a commission to investigate the position of scientific study in educational institutions, and the general attitude toward such teaching. The weekly journal, *Science*, furnishes a forum for open discussion of the scientific problems of any of the 15 divisions of the association. Programmes for each annual meeting, and every four years

a volume, *Summarized Proceedings* are also published. The president elected for 1929 was Robert A. Millikan, physicist, and director of the Norman Bridge Physical Laboratory of the California Institute of Technology, Pasadena. The permanent secretary is Dr. Burton E. Livingston, whose offices are in the Smithsonian Institution Building, Washington, D. C.

SCOTLAND. See GREAT BRITAIN

SCOTT, AUSTIN WAKESMAN (1884–). An American lawyer and educator, born at New Brunswick, N. J. He was graduated from Rutgers College in 1903 and from the Harvard Law School in 1909. He was successively instructor, assistant professor, and professor of law at the Harvard Law School, occupying the latter position from 1914. In 1920 he was appointed to the Story professorship of law. He edited several books on legal subjects and was the author of *Fundamentals of Procedure in Actions at Law* (1922).

SCOTT, CYRIL MEIR (1879–). An English composer, born at Oxtou, Cheshire. Having devoted himself chiefly to the study of the piano, he entered the Hoch Conservatory in Frankfurt in 1896, and studied composition under I. Knorr. After 1900, he lived at Liverpool, making frequent pianistic tours. In 1920–21, he made a tour of the United States. As a composer, he is recognized as the foremost of the English impressionists. So completely did he absorb the spirit of Debussy's art that his best works might easily pass as productions of the French composer. His works comprise a symphony; four overtures, *Christmas*, *Princess Malene*, *Aglarane et Selysette*, and *Pelléas et Mélisande*; two rhapsodies; *Aubade*, *Arabesque*; three *Dances*; a piano concerto, *La Belle Dame Sans Merci*, for soprano and baritone with orchestra, *Helen of Kirkconnel*, for baritone and orchestra; *Nativity Hymn*, for chorus and orchestra, a piano sextet, a piano quintet, three string quartets and a violin sonata, numerous pieces for piano, and songs. An opera, *The Alchemist*, was produced at Essen (1925), while two others, *The Saint of the Mountain* and *The Shrine*, are still unperformed. He is the author of *The Philosophy of Modernism* (1917), and *The Influence of Music on History and Morals* (1928). Consult A. E. Hull, *Cyril Scott: Composer, Poet and Philosopher* (London, 1918; 2d ed., 1921).

SCOTT, SIR GILES GILBERT (1880–). A British architect, educated at Beaumont College. He was architect for Liverpool Cathedral, the new nave of Downside Abbey, the restoration of Chester Cathedral, the new buildings of Clare College, Cambridge, and for numerous church buildings. He became a member of the Royal Academy in 1922 and was knighted in 1924.

SCOTT, HUGH LENOX (1853–). An American army officer (see Vol. XX). General Scott served as Chief of Staff, U. S. Army, from 1914 to 1917. After retirement by the operation of law in 1917, he was retained on active duty to May 12, 1919. In the World War, he was a member of the United States Commission to Russia (1917) and in the same year was appointed commander of the 78th Division. He served with a British Division in the front line at Arras and with a French Division at Chalons, and was present at the Battle for Passchendaele Ridge (1917). He was awarded the Distinguished Service Medal in 1918. Since 1919 he has been a member of the Board of Indian Commissioners. He is also

a member of the New Jersey State Highway Commission. In 1928 he wrote *Some Memories of a Soldier*.

SCOTT, JAMES BROWN (1866–). An American authority on international law (see Vol. XX). He was special adviser of the Department of State, and chairman of the Joint State and Neutrality Board (1914–17), and technical delegate to the Paris Peace Conference (1919). In 1928 he was a United States delegate to the Pan-American Conference at Havana. In 1915, he became president of the American Institute of International Law and, in 1910, trustee and secretary of the Carnegie Endowment for International Peace. His later books include *An International Court of Justice* (1916); *Peace Through Justice* (1917); *A Survey of International Relations between the United States and Germany, Aug. 1, 1914–Apr. 6, 1917* (1918); *James Madison's Notes on Debates in the Federal Convention of 1777 and Their Relation to a More Perfect Society of Nations* (1918); *Robert Bacon, Life and Letters* (1923); *Sovereign States and Suits* (1925); *Sixth International Conference of American States*.

SCOTT, LEROY (1875–). An American author, born at Fairmount, Ind., and educated at Indiana University. On graduation he engaged in newspaper work (1897–1900) and later was assistant editor of the *Woman's Home Companion* (1900–01). During 1902–03 he was assistant headworker of the University Settlement in New York City and afterward devoted his whole time to writing. His books include *The Walking Delegate* (1905), *To Him That Hath* (1907), *Counsel for the Defense* (1912), *No. 13 Washington Square* (1914; dramatized, 1915), *Partners of the Night* (1916); *Mary Regan* (1918), *A Daughter of Two Worlds* (1919); *Children of the Whirlwind* (1921), *Cordelia the Magnificent* (1923), *The Heart of Katie O'Doone* (1925); *The Trail of Glory* (1926).

SCOTT, WALTER DILL (1869–). An American university president and psychologist, born at Cooksville, Ill., and educated at Northwestern University and at McCormick Theological Seminary. He began his career as associate professor of psychology and education at Northwestern University in 1901 and became president of that institution in 1920. He was director of the Bureau of Salesmanship Research of the Carnegie Institute of Technology during 1916 and 1917 and has been president of the Scott Company, consultants and engineers in industrial personnel, since 1919. In 1917 he was appointed director of the committee on classification of personnel in the United States Army, a work for which he received the Distinguished Service Medal. In 1918 he was made colonel. In 1927 he was chairman of the American Council on Education. He wrote *Die Psychologie der Triebe* (1900), *The Theory of Advertising* (1903); *The Psychology of Public Speaking* (1907); *The Psychology of Advertising* (1908), *Influencing Men in Business* (1911), *Increasing Human Efficiency* (1911); *The Psychology of Advertising in Theory and Practice* (1921), *Science and Common Sense in Working with Men* (1921); *Personnel Management* (1923).

SCOTT, WILLIAM ROBERT (1868–). A British economist, educated at St. Columba's College, Rathfarnham, and Trinity College, Dublin. He was assistant to the professor in moral

philosophy (1896-1901) and lecturer in political economy (1899-1915) at the University of St. Andrew, becoming Adam Smith professor of political economy at the University of Glasgow in the latter year. He was a member of the council of the British Academy (1919-25) and of government committees on cooperative credit (1919), farm economics (1925), and other subjects. He wrote *Francis Hutcheson* (1900); *Scottish Economic Literature to 1800* (1911); *The Constitution and Finance of English, Scottish and Irish Joint Stock Companies to 1720* (3 vols., 1910-12); *Economic Problems of Peace after War* (2 series, 1917 and 1918); and *Introduction to Everyday Life on a Highland Farm, 1769-1780*.

SCOTTI, skôtté, ANTONIO (1866-). An Italian dramatic basso (see VOL. XX). In the spring of 1921, after the close of the regular season at the Metropolitan Opera House, he organized the Scotti Grand Opera Company, recruited largely from the Metropolitan artists, which made a very successful tour of the Eastern cities. This tour later became an annual event. On the occasion of the 25th anniversary of his connection with the Metropolitan Opera House, the management honored him with a gala performance of *Tosca* (Jan. 1, 1924).

SCRANTON. A mining and manufacturing city of Pennsylvania. The population rose from 129,867 in 1910 to 137,783 in 1920 and to 144,700 in 1928, by estimate of the U. S. Bureau of the Census. Building construction has been active since 1920. In addition to an \$800,000 Chamber of Commerce Building and a new Masonic Temple, numerous industrial plants and commercial buildings have been erected. In 1923 Weston Field, an eight-acre community playground, equipped with baseball fields, tennis courts, and a recreation building, was constructed. In 1929 the Everhart Museum of Natural History, containing the Hollister Collection of Indian Relics, was remodeled and enlarged. The public-school system of Scranton in 1928 consisted of 47 elementary schools, 1 junior high school, and 2 high schools, with a total enrollment of 32,174 pupils. The parochial schools numbered 12, with an enrollment of 6342 pupils. In addition, two private institutions were conducted under the auspices of the Roman Catholic Church: St. Thomas's College for boys and Marywood College for girls. Scranton has the largest lace mill in the United States and ranks second as a silk-manufacturing centre. Other manufactures include phonograph records, white lead, mine machinery, centrifugal pumps, bolts and nuts, fabricated steel, automobile trucks, graphic arts machinery, drawing instruments, beds, mattresses, curtains, electric lamps, stoves, knit goods, concrete, and building tile. In 1927, 11,115 persons were employed in the city's factories and received \$12,310,614 in wages, the value of products manufactured was \$55,704,206. Scranton has 5 national banks, 13 State banks, and 3 trust companies, whose deposits in 1928 amounted to \$116,618,266. Bank clearings in the same year amounted to \$329,092,840. The assessed valuation of property in 1928 was \$126,754,730; the net debt was \$7,142,912.

SCULPTURE. The immediate effect of the World War was a practical cessation of production; but the demand for memorials soon caused a revival after the close of hostilities. There was, however, no change in the tendencies of sculpture, which remained much the same.

France. On Nov. 17, 1917, Rodin, born 1840, the greatest of French sculptors, died. His art was the culmination of the naturalism of the nineteenth century, and it was chiefly he who developed the highly pictorial character of most contemporary art. His breaking up of the surfaces into bosses and hollows to attain the subtle modeling and effects of light and shadow, in which he so greatly excelled, and his rendering of instantaneous movement realized in sculpture a measure of representation hitherto confined to painting. The impressionism of his later period, neglecting more and more the non-significant parts and emphasizing only the characteristic and essential, paved the way for the sketchy character of most modern work and finally for the vagaries of post-impressionism. The dominating feature in the later development of French and, indeed, of European sculpture was undoubtedly the influence of Rodin, which may be compared with that of Michelangelo on Italian sculpture of the sixteenth century, when, as in the later time, it was easier for less gifted artists to copy the master's weaknesses rather than his strength. The peculiarities which in Rodin's work were balanced by marvelous modeling and profound depth of sentiment became mannerisms in the works of his less gifted followers. The influence was in part disastrous, aided as it was by other disintegrating tendencies in French art. Even the older men, Rodin's immediate contemporaries, lost their bearings. The public monuments of France just before the War were for the most part tawdry, in poor taste, and unmonumental. This was apparent in the later work of such able artists as Mercié, Fremiet, Barrias, and others, and to a less extent in those of Saint Marceaux and Falguière. The next generation followed generally in these footsteps. The later work of men like Denys Puech, François Larche, Verlet, Villeneuve, Charpentier, and others possessed the same false note.

Salvation came from a group of younger men, also under the influence of Rodin, who, following Bartholomé's advice, carved great simple figures in native limestone, as the mediæval masters had done. The three foremost of these were: Aristide Maillol (1861-), an artist of elemental power and primitive methods, whose aim is sculptural bulk; Émile Bourdelle (1861-) Rodin's direct successor, whose mighty portrait heads and dramatic groups and reliefs well emulate the work of his master and Henri Bouchard (1875-), a strong, versatile, well-balanced artist. Among sculptors practicing the more finished modeling along traditional lines and whose works are of real artistic worth were the clever François Sicard, Quilvic for Breton subjects, Constant Roux, Cordonnier, Jules Desbois, Gustave Michel, Jean Boucher, and later, Marcel Jacques, Maurice Faure, and Jeanne Hainin. The War brought the usual crop of designs for military memorials, mostly bad.

Mention may be made here of post-impressionism, the reaction against the unbridled naturalism and cleverness of much official French sculpture. For although its chief exponents were not native Frenchmen, yet they studied in Paris, and it was there that they found their principal support. Post-impressionism endeavors to represent the human figure in a purely abstract way, with little or no reference to natural appearance. The method consists in the elimination of almost all modeling except of the parts chosen

JAMES EARL FRAZER
"THE END OF THE TRAIL"

for characterization, which are exaggerated out of all semblance to nature. This is exemplified in the strange portraits, usually expressing a highly rarefied type of humanity, by Constantin Brancusi, a Rumanian. Other well-known representatives were Raymond Duchamps-Villon (1876-1918); Gautier-Brzeska (1891-1915), a young man killed in the trenches during the War, who belonged to the vorticists; and Aleksandr Archipenko, most important of the group, described below among the Russians. The little figures of Henri Matisse are as curious as his paintings. Umberto Boccioni, an Italian Futurist, tacked all kinds of actual objects such as glass, wood, cardboard, cloth, and electric lights, to the sculpture represented; following in this the custom of Futurist painting. Among younger sculptors of Cubistic tendencies are Jacques Lipchitz (1891-), who builds up his figures in layers, and Henri Laurens (1885-), at times archaistic but who endows even Cubistic figures with linear grace and charm. See PAINTING.

Germany. From the early years of the twentieth century, a veritable renaissance of sculpture took place in Germany and Austria. Nowhere else was the change as marked. The outworn realism and romanticism of the late nineteenth and early twentieth centuries were replaced by a new and more vital naturalism, of a strikingly simplified and essentially decorative character. The new sculpture was conceived as a part of the building or monument to which it belonged, subordinated to the *Massgefühl*, i.e., the feeling for the mass of the whole. It combines technical ability of a high order in modeling, carving, and casting with a mastery of the most varied materials of sculpture. It seeks to express character and its chief attribute is power, even to the point of brutality. This new German style found its most striking expression in a series of national monuments, such as the colossal statue of Bismarck at Hamburg, by Hugo Lederer, conceived in the style of the mediæval effigies of Roland, and the Volkshaus Monument by Bruno Schmitz, commemorating the Battle of Leipzig, the largest military monument in the world. The sculptures of the latter, by Franz Metzner, are in a class by themselves, colossal, harmonious, and mysterious. The clever adaptation of sculpture to architectural effects is seen also in many recent buildings. In the Haus Rheingold, a Berlin restaurant, Metzner employed the human body as a purely decorative form with astounding effect. Other examples of subordination and simplification are the reliefs of the Burgtheater in Vienna, by Luksch-Makowska, and especially the sculptures of the proscenium of the Marble House Theatre in Berlin, by G. S. Sieburg, in which simplification is pushed to the utmost limit.

The most influential and widely imitated figure in later German sculpture was Franz Metzner (1872-1918), whose art, often grotesque and enigmatic, shows a profound feeling for mass and is masterful in technique. The best qualities of this modern German sculpture—power, plasticity, and ability—are exemplified in such works of Hugo Lederer (1871-) as the Krupp memorial at Essen. Of powerful monumental quality is also the work of Benno Elkan (1877-), in his fine funerary sculpture, such as "The Stone of Lamentation" at Wickrath in the Rhine Province, his lifelike busts, and his medals. Anton Hanak (1875-) of

Vienna is primarily a sculptor in marble, whose inspiration is Michelangelo and the Greeks. The stone and marble nudes of Hermann Haller, Hubert Kowarik, Hans Damman, and Karl Stemolak are Hellenic in simplification and of fine sculptural quality. A master marble cutter was Theodor Georgii (1883-), whose work is carved directly out of the stone. He was also a leader in animal sculpture, in which connection August Gaul (1868-), especially, and Fritz Behn (1878-) should be mentioned. Other important carvers of stone and marble among the younger men were Arthur Lange, Ernst Seger, Joseph Limburg, and Adolf Brutt.

The decorative talent of the contemporary German school was especially evinced in the treatment of most diverse materials, as in Joseph Wackerle's archaistic figures of travertine. Audacious and powerful experiments in tinted sculpture were made by Benno Elkan and others. Charming, if startlingly modern, effects were attained in porcelain by Theodor Eichler and Bernhard Hötger of Darmstadt. Wood-carving was practiced more extensively and enthusiastically in Germany than elsewhere, by Hermann Haller in Berlin, Richard Langer in Munich, and especially Franz Barwig in Vienna. Foremost, perhaps, of the modern Expressionist group is George Kolbe (1877-), whose art, however, is based upon nature. Early influenced by Rodin, but more by study with Tuailon and of the antique in Rome, he achieves permanent, typical, as distinguished from momentary, individual effects.

The most recent development of German Expressionist sculpture was strongly influenced by Maillol. The chief representatives include Hermann Haller (1880-) and Ernestodi Fiori (1884-), both clever at posing, more pleasing than powerful. Wilhelm Lehmbruck (1881-1919), whose elongated, originally conceived nudes are the antipodes of Maillol's compressed figures; and Ernst Barlach (1870-), sculptor in wood, who found inspiration for his powerful primeval figures in the peasant art and types of southern Russia. The most radical of the group, at times Cubistic, is Rudolf Helling (1886-), whose powerful, tectonic figures and groups show mastery of movement and contrast of form. His strong, often distorted, portrait heads are highly characteristic.

Other European Countries. Among prominent British sculptors was Sir George Frampton (1860-1923), known especially for his polychrome sculptures. His monument to Edith Cavell, erected in St. Martin's Church, Trafalgar Square, London, in 1920, shows his conversion to Greek archaism, a very startling change. This is a sign of the diminishing vogue of the union of the arts and crafts movement with sculpture, so successfully practiced by Alfred Gilbert (1854-) and his followers. The outstanding feature of British sculpture of the day was the prevalence of the French influence, modified by the more ascetic requirements of British taste. Among the older men, Hamo Thornycroft (1850-1925) and Alfred Drury (1859-), the foremost representative of the French influence in England, continued an important activity. Of great imaginative power and originality is the work of Bertram MacKenna (1865-), an Australian trained in Paris, although his later memorials showed increased conformity to prevailing British tastes. His equestrian statue of

Edward VII in Trafalgar Square was unveiled in 1921. Gilbert Bayes (1871-) was known chiefly for the use of the horse as a motif and for his interesting accessories. Among other men whose work is noteworthy are S. Nicholas Babb, Albert Toft, Ernest Gillick, Benjamin Clemens, Richard Garbe, whose art is characterized by a certain brutal strength, Havard Thomas, and Derwent Wood. There are also the very modernistic productions of Jacob Epstein (1880-), who was born in New York and received his principal art education in Paris. His "Christ" in particular provoked much discussion.

In Belgium, the glorification of labor, so ably begun by Meunier, was notably continued by J. van Biesbroeck, of Ghent. The more conservative tendencies were represented in the work of Victor Rousseau (1865-), whose bronze group entitled "Gratitude," erected in Trafalgar Square in London, was presented by Belgium to Great Britain in 1920. The most startlingly original of Belgian sculptors of the period was Georges Minne (1867-), likewise of Ghent, whose spare and highly stylized figures are of great power.

Scandinavian sculpture was very modern and showed the French influence, modified by native requirements. Among Swedish sculptors, the lifelike and rather unfinished works of Carl L. Eldh (1873-) are impressionistic in character. Carl Milles (1875-) shows great versatility of subject, ranging from prehistoric monsters to dancing girls; he is always monumental in his presentation. Noteworthy work also has come from the hand of the lively, imaginative Icelandic, Einar Jonsson.

Russian sculpture was cosmopolitan in character, as the artists were trained and lived largely abroad, especially after the social revolution. The art of Prince Paul Troubetzkoy (1866-), born in Italy, self-taught, and much influenced by Tolstoy, is clever and impressionistic in character. Naoum Aronson, who resided in Paris, was a striking individualist, excelling especially in his interpretation of children. Modernism had numerous representatives, chief among them Archipenko (1887-). A Ukrainian by birth and early training, he was active chiefly in Paris, Berlin, and latterly in New York. By simplifying the parts of the human body into geometrical shapes and emphasizing its curves in taking various postures, he achieves sculptured bulk. His elongated female nudes show remarkable mastery of elegant and sinuous line. Quite unique is his sculpto-painting, uniting the two arts.

The Italians are the best stonecutters in the world, and their sculpture is characterized by a manual dexterity and florid ornament which proved itself a bane. Biondi (1885-1917) was known for his large groups carved more or less disconnectedly, and often revoltingly naturalistic, with the exception of his latest production, "Les Récluses Misérables," which, strange to say, was highly spiritualized and well composed. Vincenzo Gemito (1852-) modeled charming bronze genre subjects, usually representing Neapolitan urchins. Leonardo Bistolfi (1859-) of Turin created some work of true monumental character, like his fine "Offering" on the Victor Emmanuel monument at Rome. In 1915 a superb Garibaldi monument by Eugenio Baroni was unveiled near Genoa.

Spanish sculpture also suffered from parade

of technique and too many accessories. The foremost sculptor at the close of the period was José Clara (1878-), whose art is always personal and interesting, sometimes even titanic. More or less directly connected with the development in Germany and Austria is the art of the non-German peoples who once formed a part of Austria-Hungary. Their art, like the Germans', emphasizes the mass and strives after power and characterization. Among the prominent figures were Nicholas Ligeti and Geza Maroti of Budapest and Jan Stursa of Prague, known especially for his subtly modeled figures of girls. Foremost of all was Ivan Meštrović (1883-), born in Dalmatia, and the national sculptor of Yugoslavia. He studied at Vienna under Franz Metzner, whose art his own most resembles, and was also for a time in Paris, where he was influenced by Rodin, who is said to have pronounced him "the most remarkable of living sculptors." His powerful and dramatic art shows a certain influence of the archaic Greek and, in religious subjects, of Byzantine traditions.

The United States. In no other country was there such an increase in the output of sculpture during the twentieth century as in the United States. So great was this that the volume of sculpture produced after 1900 more than equaled all that had been done before that time. One of the reasons for the increasing output was the wide use of architectural sculpture, especially on public buildings, and the willingness of important sculptors to devote themselves to such work; another was the great demand for public monuments throughout the country, a third was the demand for garden sculpture, especially for fountains in public parks and private grounds. Owing to the distance of America from the scene of conflict and to its late entrance into the War, there was no such cessation of artistic production during the War as took place in Europe.

As compared with the development in Europe, American sculpture took a middle course, avoiding conservative and radical extremes, sometimes indeed a little restrained, but escaping the extravagances of post-impressionism. The chief centre of production continued to be New York and its vicinity, where nine-tenths of American artists live and labor. They come, however, from the length and breadth of the land, the greater number from west of the Alleghenies, and some from the Far West.

During the period 1914-29, the United States lost several important sculptors. Foremost among them was Karl Bitter (1867-1915), killed in his prime by an accident. His latest works, such as the granite pediment of the Wisconsin State Capitol and the Lowry memorial of Indianapolis, show constant development of a decorative sense and mastery of material. A fitting termination for the activity of Henry M. Shrady (1871-1922) was the national U S Grant memorial at Washington, D. C., especially the colossal bronze equestrian statue of Grant which ranks among the best of the day. Bela L. Pratt (1864-1917), active as a teacher in Boston, is known for his youthful, girlish nudes. Solon A. Borglum (1868-1922), for cowboy and Indian subjects and many monuments. Among others were John J. Boyle (1852-1917), sculptor of red men; Edith Woodman Burroughs (1871-1918), famed for girlish figures and characteristic portrait busts; and Charles Cary

Rumsey (1879-1922), known especially for his horses

Among the older men, the extensive production of Daniel Chester French (1850-), dean of American sculptors, combined with his customary good taste and pure form, reveal a distinct increase in power, as may be seen in the lovely nude "Memory" in the Metropolitan Museum of New York City, the colossal seated "Lincoln" for the national Lincoln memorial (1919), and the Dupont Fountain (1922), both in Washington, D. C. Besides his monumental sculpture, Herbert Adams (1858-) continued the production of sensitively tinted heads of young women. Charles H. Niehaus (1853-), "indefatigable builder of monuments," had a number of later works to his credit, like the Francis Scott Key monument at Baltimore (1922), and so had J. Massey Rind (1860-), besides a vast quantity of decorative sculpture.

The later works of Frederick MacMonnies (1863-) continued his novel and exotic ideas, as witness the Denver "Pioneer" fountain, the Princeton battle monument and the much criticized "Civic Virtue" a fountain in New York. George Gray Barnard's (1863-) profound, symbolic work is worthily expressed in some of his recent statues, such as "Women" (Metropolitan Museum, New York City). His powerful realistic and magnificently characterized bronze Lincoln (Cincinnati, Ohio, and Manchester, England) caused more discussion than perhaps any other American statue. Paul Bartlett's (1865-1928) thoughtful and skillful technique is revealed in the grandiose pediment of the House of Representatives in Washington and his delicate architectural figures on the New York Public Library. Gutzon Borglum (1876-) was in 1924 engaged on a group of 42 heroic figures in bronze for Newark, N. J., and on a colossal relief, 700 by 100 feet, involving several hundred figures, to be carved in the face of Stone Mountain, near Atlanta, Ga. The latter is a memorial to the Confederate Army and the most colossal work of sculpture ever attempted. Owing to disagreement between Mr Borglum and the donors, the entire commission was withdrawn and given to Augustus Lukeman.

Among other sculptors producing important public monuments were Hermon A. MacNeil (1866-); Albert Jaegers (1868-), who did the fine "Pioneer" monument at Germantown, Pa.; Edmond T. Quinn (1868-), whose work is tasteful and conscientious; Alexander S. Calder (1870-); Adolph A. Weinman (1870-); and Augustus Lukeman (1872-). The Piccirilli family is celebrated for skillful marble cutting. Among their important recent works are one of the pediments of the Wisconsin State capitol at Madison by Attilio Piccirilli (1866-) and a statue of Pierre Gautier de la Varenne, forming part of the decoration of the Parliament House at Winnipeg, Canada, which was entirely in charge of his brother, Furio (1868-). Charles Gaffey (1862-), the well-known teacher in Philadelphia, in later years devoted himself to portraiture, in which he was unsurpassed in American sculpture. Lorado Taft (1860-), dean of Chicago sculptors, in later years devoted himself to the creation of fountains such as the "Fountain of Time" in Chicago (1922). Cyprus Dallin of Boston (1861-) continued his distinctive work, the representation of the American Indian.

Among animal sculptors, Phinister Proctor

(1862-) recently subordinated animals to the human figure in a series of monuments. Edward C. Potter's (1857-1923) works included the much discussed lions at the Public Library in New York. Excellent indeed are the animal bronzes of F. C. R. Roth; Eli Harvey; Albert Laesle (1877-), who depicts in unique manner the humor of animal life; and Anna V. Hyatt (Mrs Archer Huntington) (1876-), whose spirited equestrian "Joan of Arc" on Riverside Drive, New York City, is a stirring conception. The War offered fine opportunity for the medalists, chief of whom in the United States were John Flanagan (1865-), designer of the well-known Médaille de Verdun (1921), and Victor D. Brenner (1871-1924).

The sculpture of the men born after 1870 was full of promise for the future. Andrew O'Connor's (1874-) figures, such as the "Soldier" at Worcester, Mass., and the "Lincoln" at Springfield, Ill., are virile in conception and well modeled. The art of James Earle Fraser (1876-) is marked by skill and good taste, as in "The End of the Trail," shown in the plate, and his relief is wondrously delicate. Lee Lawrie (1877-), of German origin, an architectural sculptor, is well represented by the figures of the reredos of St. Thomas's Church in New York City. Mahonri Young (1877-), well known as a teacher, has specialized in characteristic statuettes of laborers. Rudolf Evans (1878-) became famous as a carver of beautiful nudes through "The Golden Hour" in the Luxembourg, Paris, and Metropolitan Museum, New York City. Robert Aitkin (1878-), a strong yet versatile artist, has executed monuments, garden figures, busts, coins, and medals which are widely known. Grace and charm are the marked characteristics of the carefully modeled work of Edward McCartan (1878-). The vivid portraits by Jo Davidson (1883-) of figures prominent during the War are powerful and artistic, as well as historic documents.

The American Academy at Rome had a marked influence on later American sculpture through the young men who enjoyed its four years' scholarships. The dominant note of their art is Greek archaism in all decorative and conventional features, but less in figure modeling. The execution is on the whole more finished than that of the group which studied chiefly in Paris. Sherry Fiy (1874-) combined the archaic note with careful and interesting modeling. John Gregory (1879-) is known for charming garden figures. The art of Chester Beach (1881-) reflects rather the Rodin-esque than the archaic motive. It is clear, individualized, and of rugged quality. Likewise, the art of Albin Polasek, an excellent portraitist, and since 1924 instructor in the Art Institute in Chicago, also is rather naturalistic than archaic. The chief representative of the latter-day classicism was Paulanship (1885-), a master craftsman of archaic decoration, combined with skillful modeling of the nude. In Leo Friedlander's (1889-) work, the archaic is united with a certain brutal power reminiscent of the modern German school.

A striking feature of the development of American sculpture during the period was the large number of women sculptors, greater than in any other country and larger than that of women painting in the United States. Although practicing all branches of sculpture, they excel especially in representing women

and children, garden sculpture, and small bronzes. Janet Scudder (1873-) is known for her fountain figures; Bessie Potter Vonnoh (1872-), for simple domestic scenes invested with great charm; Abastenia Eberle (1878-), for plastic sketches of the humble life of a great city. Evelyn Beatrice Longman (1874-) has created a series of busts, bronze doors, and memorials; Laura Gardin Fraser (1889-), nudes and miniature reliefs; Anna V. Hyatt, animals; Malvina Hoffman (1887-), spirited figures and groups; Frances Grimes, graceful marble reliefs; Harriet W. Frishmuth (1880-), dramatic nudes; Gertrude Vanderbilt Whitney, a number of important public commissions.

Modernist tendencies found little echo in American sculpture. Their chief representative was Gaston Lachaise (1887-), a Frenchman, trained in the Beaux Arts, but who came early to the United States and developed his art in New York. He models and carves powerful female types of ample proportions, peacocks, sea-lions, dolphins, and the like, with fine simplification of line, correct relation of masses, and linear rhythm.

Bibliography. The best comprehensive view of the development of the period preceding 1921 is Lorado Taft's *Modern Tendencies in Sculpture* (Chicago, 1921). Other accounts are by C. R. Post, *A History of European and American Sculpture*, vol. ii (Cambridge, 1921); and Kington Parkes, *Sculpture of To-Day* (London, 1921, 2d ed., 1928). For the United States, consult the supplementary chapter to Lorado Taft's *History of American Sculpture* (New York, 1923). See also Adeline Adams, *The Spirit of American Sculpture* (New York, 1923) and the current art magazines. The latest development will be found in Ozenfaint, *L'art* (Paris, 1928); and Carl Einstein, *Die Kunst des 20. Jahrhunderts* (2d ed., Berlin, 1928).

SCURVY. The ideal antiscorbutic diet seems still undetermined. Originally, the disease was attributed in part to the substitution of salted for fresh meat. Experiments on animals have shown that, although fresh meat contains antiscorbutic vitamin C, it is insufficient to prevent the development of scurvy if the diet is otherwise free from this vitamin C. There is evidence that to contain effective vitamin C, the meat must be raw and quite freshly killed. Arctic explorers escape scurvy at times by subsisting on freshly killed game; fresh fish is devoid of this vitamin, and this is also true of the fat of meat. Indians and Eskimaux appear to prefer fresh viscera to fresh muscle and always bargain for the former when dividing game with white men. It goes without saying that all preserved and tinned meat is unsuitable in an antiscorbutic dietary, and raw viscera are out of the question for white men. There is a considerable propaganda for the purpose of prevailing on the white man to settle permanently within the Arctic Circle, called forth by the century-old misrepresentation concerning this climate. Steffansson has shown that the weather there can be matched in every way with that of certain portions of the northern United States. The degree of cold, amount of snow, and other seasonal drawbacks are not materially worse in the Arctic and are often better. A greater drawback might be scurvy due to the absence of fresh game and other foods containing the vitamin C. To go

through the winter free from scurvy, there would have to be a plentiful supply of potatoes, apples, canned tomatoes, and fresh milk; and dried and evaporated vegetables would not serve.

It has been commonly believed that "land scurvy" no longer occurs in the adults of civilized races unless under extraordinary conditions and even the hardships of the World War did not bring this affection into prominence among the deficiency diseases. Infantile scurvy, or Barlow's disease, is naturally quite a different affection and does not here concern us. Within the last few years, however, adult scurvy has occasionally been encountered in the Massachusetts General and Boston City hospitals and it is thought that such cases may often escape recognition. It was a mystery how such cases could develop on a background of national prosperity and an inquiry showed that the few patients with the disease were all single men with very low earning capacity who lived lives of hardship and privation without any kind of feminine supervision. Not one of the victims was of the "bum" or alcoholic type; but the crux of the matter was merely the lack of adjustment between low wages, the high cost of living, and ignorance of true economic values. SEARES, FREDERICK HANLEY (1873-). An American astronomer, born at Cassopolis, Mich. He studied at the University of California and in Berlin and Paris. During 1901-09 he was professor of astronomy and director of the Laws Observatory in Missouri. In 1909 he was called to the charge of the computing division and of the publications of the Mt. Wilson Observatory of the Carnegie Institution and since 1925 he has been assistant director of that observatory. Among the special investigations by which he advanced the knowledge of astronomy are studies on the theory of orbits and perturbations, distribution of stars, and the general magnetic field. He is a member of the National Academy of Sciences.

SEATTLE. A seaport and manufacturing city of Washington. The population increased from 237,976, in 1910 to 315,685 in 1920 and to 383,200 in 1928, by estimate of the U. S. Bureau of the Census. The population of the metropolitan area in 1928, according to local estimate, was more than 500,000. Among recent outstanding buildings erected were the \$1,000,000 Civic Auditorium, Arena, and Recreation Field and the Northern Life Insurance Tower, 27 stories in height, built at a cost of \$1,775,000. The auditorium had a seating capacity of 7500 persons; the arena, a maximum capacity of 900 persons; and the recreation field, with facilities for all outdoor sporting events, contained permanent stands for 9000 persons. Other civic improvements included the leveling of some 28 blocks on Denny Hill, adjoining the uptown retail district, at a cost of \$1,050,000; the installation of a new lighting system; the widening and repaving of Third Avenue; and the extension of Second Avenue through four city blocks occupied by old buildings to a traffic outlet beyond the two railroad stations at a cost of \$1,250,000. In 1919 the city pur-

chased the street railway system on a \$15,000,000 public utility bond issue and by 1929 was operating 238 miles of municipally-owned lines. In 1924 it supplemented its municipal power plants by the development of the Skagit River power project. The principal feature was the construction of Diablo Dam at a cost of \$2,263,000. In 1926 Lake Youngs was developed as a storage reservoir with a 4,000,000-gallon capacity, at a cost of \$4,000,000. In 1929 a bond issue of \$13,500,000 was authorized for the completion of the project, including the construction of a new power house at a cost of \$2,500,000.

The Seattle Harbor has 193 miles of waterfront, 53 miles of which are on tidewater and 140 miles on fresh water. In 1928 there were 60 commercial piers with a berthing space of 72,484 feet. The combined areas of all the wharves was 142 acres with storage capacity for 5,226,700 bushels of grain, 40,000 tons of coal, and 1,015,781 barrels of fuel oil. The total water-borne commerce of the port in 1928 amounted to 35,901,706 tons valued at \$1,104,300,890. It is served by 119 steamship routes. In 1927, 20,745 persons were employed by 1157 industrial establishments and received \$30,032,120 in wages; the value of products manufactured was \$170,325,692. The principal industries concerned airplanes, automobile bodies, chemicals, boat and ship building, building equipment, canned food products, fishing, flour and cereals, harness and saddlery, iron and steel articles, marine machinery, mining equipment, paints and varnishes, refrigerators, rope and cordage, shoes, gloves, and hats, stoves and furnaces. The clearings of Seattle's 29 banks in 1928 amounted to \$2,542,920,897. The value of building permits increased from \$27,270,500 in 1924 to \$34,813,000 in 1928. The assessed valuation of property in 1928, according to local estimate, was \$594,710,308, the net debt in 1927 was \$74,714,000.

SECRETIONS, INTERNAL. Endocrinology has made prodigious advances in the period following 1914, as shown by the formation of a national society for the study of internal secretions, the appearance of a quarterly magazine devoted to the subject, and the publication of an encyclopedic work on the endocrines edited by Dr. Barker of Johns Hopkins. Naturally, the subject of organotherapy belongs under this heading, including insulin and the sensational work in so-called rejuvenation done by Steinach and his followers, Voronoff, and others. Dr. Barker in summing up endocrinology in the *Journal of the American Medical Association* (July 8, 1922), prefers the term *incretin*, signifying internal secretion, to *endocrine substance*, *hormone*, etc. Of great immediate interest is the possible difference between active principles found in glands and whole gland substance. One of the great advances is the isolation of thyroxin, as the representative active principle of the thyroid gland, by Kendall at the Mayo Clinic. While certain incertions are active in determining the stature, length of long bones, general outlines of the face, and other static peculiarities, others are believed to determine the rate of metabolism and incidentally the temperament of the individual.

Gonads or Sexual Glands. The fact that castration of immature animals prevents the full development of secondary sex character led to the general belief that the sexual glands are the sole seat of sex. The various operations for

procuring so-called rejuvenation are based on this conviction. Many isolated facts antagonize this belief, and it became increasingly evident that sex differences extend throughout the entire organism. In other words, a woman is not a woman because of her ovaries but has ovaries because she is a woman. It is also possible to show that sex is a matter of degree of development rather than a basic antagonism. The substratum of the individual is believed to be female, with an evolutionary tendency to maleness.

Grafting testicular substance into various types of animal will produce striking phenomena, as shown especially by the experiments of Steinach on rats. These researches were carried out for years on male and female, old and young, castrated and entire. It was noted that, in addition to change in sex characters, there was also an alteration in age characters. Thus, it was apparently possible not only to alter the sex of an animal but to alter its age; in other words, to rejuvenate it. In order to understand the bearing of such experiments, it is necessary to know much about ordinary breeding of strains of animals, including crossing and hybridism, and the natural history of intact and castrated animals of both sexes. It must be remembered that the animals lead artificial lives, are purposely bred for experiment and so on. Thus, Steinach's results were at one time disputed, breeders made the claim that his senile rats which became young again were only sick rats which improved in health because of the favorable conditions secured by the experiments. Steinach seemed to have disproved this charge.

Division or Ligation of the Duct. Steinach, who at first advocated actual implantation of material from the sexual glands to produce the similitude of rejuvenation, later discovered in the course of experiment that simple division or ligation of the spermatic duct produced such stimulation of the interstitial portion of the gland as to produce the same therapeutic result as actual implantation. Owing to the difficulty of obtaining testicular material, this discovery was hailed as of major importance, for any surgeon could perform the operation at any place or time. The results of section of the duct appeared to be very unequal, striking in certain cases and negative in others. These discrepant effects were variously explained.

The direct result of ligation or division of the duct is destructive, the sperm cells undergoing atrophy. This in turn is followed by an overgrowth of the connective tissue in which are imbedded the Leydig cells which supply the internal secretion of the male gonad. This state of affairs is not permanent, for the spermatic cells show some regeneration and at the same time the Leydig cells are reduced in number. The favorable results are more noticeable in premature senility, i.e., in men less old in years, than in men in the seventies and eighties. In the really old, the benefit, when present, is of the nature of a general tonic, while in the prematurely old there may be in addition improvement in defective sexual functions.

Implantation of Testicle. This operation did not originate with Steinach, for it was performed by Lespinasse and Lydston, both of Chicago, and independently of each other, on human beings and using human testicles. Others who followed them used the testicles of animals, including those of apes, rams, beeves,

etc. This entire line of experiment is derived from the much older transplantation of ovaries, which has long been a recognized procedure, although largely limited to implantation of the woman's own ovaries after the operation of total removal of the uterus and appendages. The object of such transplantation has nothing in common with rejuvenation or reinvigoration but is solely to protect the woman from the trying symptoms which follow castration. In implanting the testicle, the same idea has been entertained in cases of accidental castration; such cases are few in comparison with the opportunities which daily present themselves of premature old age, functional loss of virility, and general breakdown of health. The simplest and easiest method consists of implanting a small slice of beef's or ram's testicle under the skin of the abdomen. The testicles of men and apes have been used in a few cases. Dr. Belfield summed up the subject of testicular implantation by stating that in the elderly the benefits, when apparent, are but shortlived. In young men who have had their gonads removed by accident or surgery or who have lost them as a result of destructive disease, the good results are more in evidence and the period of recovery longer, although it lasts only some months. The operation may of course be repeated indefinitely. It is by no means certain that this improvement is specific in character. The work of Voronoff largely corroborated that of Steinach, although his experiments were conducted on goats and rams. Steinach and his followers have reported many cases of gonad grafting in men and in women as well.

Résumé. Insulin is considered separately (see INSULIN). In regard to thyroxin, the active principle of the thyroid gland isolated by Kendall, this substance has been successfully synthesized by Harrington of Great Britain and slight but unmistakable differences have been found in its physiological action, as compared with natural thyroxin, which will doubtless be formulated in full in time. Quite recently, Kamm, chief biochemist of Parke Davis & Co., has isolated two separate hormones from the pituitary gland—the so-called "pituitary twins"—which have physiological actions quite distinct from each other. In regard to the sexual hormones and the entire subject of gland grafting and so-called rejuvenation, the status of these operations seems to have been lowered. Large surgical clinics, such as those of the Mayo brothers at Rochester, Minn., report no work of this kind and, as a matter of fact, have always ignored the subject, while Garrison in the recently issued edition of his *History of Medicine* does not even mention it among recent advances. Of considerable passing interest is the report of a case of suprarenal grafting for Addison's disease which seems to have been of marked benefit (Reinhart, in *Munchener med. Wochenschrift*, June 14, 1928).

SECRETIST, HORACE (1881—). An American economist, born at Farmington, Utah. He studied at the University of Wisconsin, where he took his Ph.D. in 1911. In 1909 he became instructor of economics at the University of Wisconsin. In 1909 he was expert special agent of the United States Census Bureau, and during 1911–12, statistician of the Wisconsin Industrial Commission, becoming also, in 1914, United States Commissioner of Industrial Relations. During the World War, he was statis-

tician to the United States Shipping Board and later the United States Railroad Labor Board. In 1912 he joined the faculty of Northwestern University, where in 1918 he became a professor and in the following year director of the Bureau of Business Research. In addition to many articles variously contributed, he is the author of *An Economical Analysis of the Constitutional Limitations on Public Indebtedness in the United States* (1914); *Readings and Problems on Statistical Methods* (1920); *Costs, Merchandising Practices, Advertising and Sales in the Retail Distribution of Clothing* (6 vols., 1921); *The Widening Retail Market* (1926); *Banking Norms and Trends Under the Federal Reserve System* (1927).

SEGONZAC, ANDRÉ DUNOYER DE (1884—). A French painter, specializing in the nude and landscape, who became known as a powerful colorist, gifted in the picturization of movement in living forms. His etchings and illustrations are among the best in modernist art. He is a member of the Salon d'Automne.

SEGUR, SA'GUR', PIERRE M M H, MARQUIS DE (1853–1916). A French historian, born in Paris, and educated at the College of Stanislas. He entered the public service in 1876 as auditor to the privy council, but after a short time relinquished that office to devote himself to the study of French history and literature. He became a member of the French Academy, which honored several of his books, in 1907. His writings consist of studies of the seventeenth and eighteenth centuries, several histories covering the reign of Louis XVI, and various articles and discourses, including *Genes d'Autrefois* (1903); *Esquisses et Récits* (1908), *Silhouettes Historiques* (1911), and *Parmi les Cyprès et les Lauriers* (1912). His *Marie Antoinette* was translated into English in 1928.

SEIDEL, SÍDEL, TOSCHA (1900—). A Russian violinist born at Odessa. At the age of seven, he began to study the violin under Max Fiedemann. From 1909 to 1911, he was a pupil of Alexander Fiedemann at Stern's Conservatory in Berlin, where Auer heard him and offered to teach him free of charge. In 1915 he made a most successful début at Christiania, and for the next three years appeared extensively throughout Scandinavia in recitals and with orchestra, and occasionally in joint recitals with Auer himself. In 1918, he made his American début at New York, and since then has made extensive tours of the country, meeting everywhere with extraordinary success. He is one of the most brilliant of the younger generation of violinists.

SEILLIÈRE, ERNEST ANTOINE AIMÉ LÉON, BARON (1866—). A French philosophical writer. He was born in Paris and studied at the École Polytechnique there, but instead of pursuing the engineering profession, devoted himself to literature and social philosophy. Strongly influenced by Nietzsche and the doctrine of the will to power, Seillière developed what he called the philosophy of imperialism, that is to say, a philosophy of masculine activity, service and organization, as opposed to the effeminate romanticism of Rousseau. He traced all the modern evils, political, social, and æsthetic, to the influence of romanticism. Curiously enough, Seillière was a partisan of Bergson's intuitional philosophy, and even his own doctrine was characterized as an inverted romanticism. The long list of his works includes: *Ferdinand Lassalle* (1897); *Le Parti socialiste allemand* (1898); *La Philosophie de*

l'Impérialisme (4 vols., 1903-08); *Le Comte de Gobineau* (1903); *Appolon ou Dionysos* (1906); *Nietzsche* (1905); *L'Impérialisme démocratique* (1907); *Schopenhauer* (1909); *Barbey d'Aurevilly* (1910); *Gustave Flaubert* (1914); *Mme. Guyon et Fénelon* (1918); *Les Origines romantiques de la morale et de la politique romantique* (1918); *Georges Sand; Les étapes du mysticisme passionnel* (1919); *Sainte-Beuve* (1920); *Jean-Jacques Rousseau* (1921); *Balzac* (1922); *Emile Zola* (1923); *Auguste Comte* (1924); *Le romantisme* (1925); *Christianisme et romantisme* (1925); *Du quietisme au socialisme romantique* (1925); *Une académie à l'époque romantique* (1926); *Morales et religions nouvelles en Allemagne* (1927); and *Pour le centenaire du romantisme* (1927). Consult *Ernest Seillière: historien du mysticisme romantique*; by J. M. L. Boudeau (1925).

SEIPEL, IGNAZ (1876-). An Austrian Chancellor, educated in the Theological Faculty of the University of Vienna, where, in 1908, he became a professor. A Roman Catholic prelate and the leading member of the Christian Socialist Party, composed of conservatives under Roman Catholic influence, he became Minister of Social Welfare in the last cabinet of the Austro-Hungarian Monarchy and was Chancellor of the Austrian Republic during 1922-24 and 1926-29. In the latter period he served also as Minister for Home Affairs and for Foreign Affairs. Criticism of his clerical connections by the Pan-German members of his coalition government and by members of his own party led to his resignation in May, 1929. As leader of the parliamentary group, he continued to exert a powerful influence upon the troubled course of Austrian politics. He is the author of *Nation und Staat* (1916); *La donna et la Questione Sociale* (1926), and *Seipel's Reden in Oesterreich und anderwärts* (1926). See AUSTRIAN REPUBLIC.

SEISMOLOGY. The word "earthquake" has in modern times acquired a twofold meaning—it still denotes a shaking of the solid earth which can be felt and may cause damage, and it is also used to denote any of those small tremors that cannot be felt but which can be detected by delicate seismometric instruments; seismology has come to be, to an ever-increasing extent, the study of the latter.

The unfelt disturbances first attracted attention because in some cases they obviously were connected with very distant quakes of destructive violence. It was soon found, however, that those which could be directly connected with distant quakes were far outnumbered by those that could not be so connected; it has been generally assumed that the latter are manifestations of violent quakes that occur under the sea or in uninhabited regions, although Oldham maintains that with few exceptions the two types of tremors are of different origins. The foci of the quakes that are felt usually lie at small depths in the earth's crust (perhaps less than 10 kilometers or 6.2137 miles), while the distant unfelt quakes seem frequently to originate at depths of 100 kilometers (62.137 miles) or more, and Oldham regards the shallow, destructive shocks (episcisms), when they happen to occur, as secondary effects of the deep-seated disturbances (bathyseisms). There still exists a good deal of disagreement among different investigators, however, as to the depths of the foci.

It is well established that tectonic quakes are due to movements and vibrations caused by the shock

resulting from sudden slips, within the solid material of the earth's crust, along fractures consequent on a state of stress. The seismographic records of the elastic vibrations which spread out through the earth from the place of origin may be deciphered with the aid of the mathematical theory of wave-propagation in elastic media; the results, together with data obtained from laboratory experiments on rocks under conditions simulating those within the earth and from a knowledge of the mean density and tidal yielding of the earth, enable the internal structure of our planet to be determined.

The vibrations of a homogeneous elastic solid consist of two types of waves, viz., longitudinal or compressional, and transverse or distortional; near the surface, these waves and their reflections may combine to produce a wave propagated continuously along the surface in which the individual particles move in vertical elliptic paths lying in the direction of propagation, there being no horizontal motion across the latter direction. The seismograph records a sudden movement of the ground whenever one of these types of waves, or a surface reflection, first reaches it. The longitudinal waves are called primary or P waves; the transverse, secondary or S waves, and the surface waves are known as Rayleigh waves, after their discoverer; each type is propagated with a different speed. The actual motion of the earth's surface is greatly complicated, however, because of the marked heterogeneity of the crust and body of the earth. In a heterogeneous elastic solid, the behavior of Rayleigh waves is quite complex; and if the velocity of distortional waves is less near the surface than in the material below, surface waves (known as Love waves) may exist in which the displacements of the individual particles are purely horizontal and at right angles to the direction of propagation. The heterogeneity also introduces internal reflections and variations in velocity.

Records of quakes obtained near the epicentre show that seismic disturbances send out three pairs of compressional and distortional waves, characteristic of three distinct layers in the crust. A number of independent lines of evidence indicate the earth to be composed of a metallic core, surrounded by a thick "rock mantle" or layer of periodotitic (ultra-basic) rocks, such as compose meteorites, followed by an intermediate basaltic layer, then by a thinner shell of granitic (acidic) rocks, and finally by a surface film of sedimentary rocks and soil; the seismic waves travel with different speeds in the successive layers. C. G. Knott finds that the rate of transmission of both the P and S waves increases continuously with distance below the surface until the wave path attains a depth about 0.3 the earth's radius. The wave paths reaching lesser depths than this have a continuously curved form, convex toward the centre of the earth, below this, the rate of propagation is nearly constant, even decreasing at certain depths, so that some of the wave paths are concave toward the centre in part of their course. Below 0.6 of the radius, the distortional or S wave is killed and is not registered at distances greater than 120 degrees from the epicentre. The rate of propagation of the two forms of wave motion is about 6.2 and 4.0 kilometers (3.85 and 2.49 miles) per second, respectively, near the surface of the earth, and about 12.8 and 6.8 at depths over 1500 kilometers (932 miles). From a study of the waves generated by the Oppau explosion, which were undoubtedly truly representative of

the uppermost layers of the earth's crust in south Germany, the Netherlands, and Alsace, Wrinch and Jeffreys have found the velocities of the P and S waves to have been respectively 5.4 and 3.15 kilometers (3.36 and 1.96 miles) per second, considerably less than in the case of ordinary earthquake waves. The Rayleigh waves, being characteristic of the lower basaltic and periodotitic layers, were absent, and in their place appeared the Love waves, transmitted largely through the continental granitic layer. Klotz found the mean velocity of the so-called "long" or L waves, which include Rayleigh and Love waves, and possibly other types of vibrations as well, to be 3.8 kilometers per second in the case of ordinary quakes; it may be shown that these waves must extend well into the lower layer of greater velocity, but that their amplitude must become inappreciable at a depth of 150 kilometers (93.2 miles); in order that the velocity be determined mainly by the lower layer, as it appears to be, it is necessary that the depth of the upper layer be a small fraction of the whole. Jeffreys concludes that the thickness of the granitic layer is of the order of 10 kilometers (6.2 miles) or a little more, while that of the intermediate layer is about 20 kilometers (12.4 miles). Knott's results apply to the basic rocks below the granitic layer. These results are consistent with laboratory measurements of the elastic constants of rocks. Mohorovičić, however, maintains that the combined thickness of the intermediate and the granitic layers is about 60 kilometers.

G. W. Walker, following up certain investigations begun by Galitzin on the angle of emergence of the wave paths, found that the focus, although sometimes quite close to the surface, is frequently at a depth of from 300 to 500 miles or more. These conclusions have been confirmed by H. H. Turner through a study of the times of arrival of seismic waves at the antipodes or anticentre. Turner's results for the relative depths of foci suggest that they collect around three chief values, and by identifying these with the three critical surfaces at the respective depths of 106, 232, and 492 kilometers (65.8, 144.1 and 305.7 miles) which were previously discovered by Galitzin from direct observations of the angles of emergence at Pulkovo, Turner obtained a value for the surface velocity of P waves agreeing with that observed in the case of the great Oppau explosion on Sept. 21, 1921. He found that 207 kilometers (128.6 miles) is the depth of the average focus corresponding to the standard seismological tables in use. The destructive quakes probably are those originating in the uppermost layer. On the other hand, Jeffreys, in a study of the waves from the Pamir quake of Feb. 18, 1911, concludes that the average depth of the foci cannot exceed 120 kilometers (74.5 miles). Jeffreys considers that most quakes, including all large ones, have focal depths in excess of 35 kilometers (21.7 miles), and that the greatest quakes occur at depths of about 100 kilometers (62 miles).

Under the direction of the Advisory Committee on Seismology of the Carnegie Institution, there has been concentrated on the study of the earth movements and seismic tremors of California probably the greatest assemblage of coöperating agencies ever put to work on a single scientific problem. The U. S. Geological Survey, in coöperation with the Seismological Society of America and various geologists, has mapped all known

faults in the State, and the Society has published a map showing all these faults; the localities where quakes may be expected are thus indicated, and in these zones the proper locations, design, and construction of buildings and other structures may be made to minimize the danger from earthquakes. To aid in tracing the faults out to sea, the U. S. Hydrographic Office, by means of a new acoustic sounding device, has made a unique contour map of the ocean bottom off the southern California coast out to beyond the edge of the continental shelf. Anderson, of the Mt. Wilson Observatory, has devised a remarkably sensitive portable torsion-pendulum seismometer, which is extraordinarily simple, cheap, and easily set up; the entire instrument weighs only a few pounds; it can be adjusted to record quakes occurring at any distance, and great numbers of these instruments may be set up about the country and used to study in detail the propagation of seismic waves from local tremors through the heterogeneous crust. The regions of California surveyed prior to 1900 were resurveyed by the U. S. Coast and Geodetic Survey during 1922-25, in order to determine what earth movements had taken place in the interval during and following the San Francisco earthquake of 1906; after the completion in 1928 of a new readjustment of the triangulation net covering the western United States, it was found that many stations in the neighborhood of the San Andreas fault, near to and southward from San Francisco Bay, had moved by appreciable amounts: The trend of the displacements to the east of the fault is southeastward, while that of stations to the west of the fault is northward or northwestward, the largest movements have occurred close to the fault, while stations more than 20 miles from the fault have been affected only slightly if at all. The largest movement found is a relative shift of 14 feet between Ross Mountain and Point Reyes Lighthouse.

The great Russian seismological organization did a vast amount of valuable work under Galitzin, but with the death of its famous leader and the political revolution, it gradually went out of existence. Seismological work in Russia was recommenced at several stations in 1923. Galitzin improved the Milne seismograph almost out of recognition, producing the best such machine yet devised. The much less elaborate and less expensive instrument devised by J. J. Shaw is but little inferior to Galitzin's. Another new type of seismometer has been invented by Wenner, of the U. S. Bureau of Standards, in which the shock transmitted by the earth to the instrument is recorded, at any desired distance, through a galvanometer.

Horizontal pendulums, specially designed to record tilting of the surface of the earth, have been found by the Japanese to show (in addition to certain regular variations) irregular variations which, in some cases at least, occur just before earthquakes.

Necrology. The following eminent seismologists have died during the period since 1914: Prince Boris Galitzin, May 4, 1916; J. Perry, Aug. 5, 1920; G. W. Walker, Sept. 6, 1921; C. G. Knott, Oct. 26, 1922; Fusakichi Omori, Nov. 8, 1923; Otto Klotz, Dec. 28, 1923; Comte Fernand Montessus de Ballore, 1923; Emil Wiechert, Mar. 19, 1928; Giulio Grablovitz, Sept. 19, 1928.

Bibliography. New books of importance on seismology are C. Davison, *A Manual of Seismology* (Cambridge Press, 1921); G. W. Walker,

Modern Seismology (London, 1913); B. Galitzin, tr. by O. Hecker, *Vorlesungen über Seismometrie* (Leipzig, 1914); H. SELLARS, Roy Wood (1880–). An American college professor and author, born at Egmondville, Ont., and graduated at the University of Michigan in 1903. He began teaching at the University of Michigan in 1905 and became associate professor of philosophy there in 1918 and professor in 1923. He wrote *Critical Realism* (1916), *The Next Step in Democracy* (1916); *The Essentials of Logic* (1917), *The Next Step in Religion* (1918), *Essays in Critical Realism* (1921); *Evolutionary Naturalism* (1921); *Principles and Problems of Philosophy* (1926); *Religion Coming of Age* (1928).

SENATE RESERVATIONS. See UNITED STATES, *History*

SENESCENCE. See ZOOLOGY

SENSATION. Cutaneous Sensation. Head's theory of protopathic and epicritic sensibility was attacked from two quarters. H. Carr (*Psychological Review*, vol. xxi) criticized the theory on grounds both of logic and of observation. E. G. Boring, repeating Head's experiment under improved conditions, reported his own observations of the return of cutaneous sensitivity after section of a sensory nerve (*Quarterly Journal of Experimental Psychology*, vol. x). He found that the results which Head's technique threw into high relief lost their special importance in the light of a more refined method, and that they took their place in a total body of fact which shows no such line of cleavage as that described by the British physiologist.

Boring himself outlined a theory of multiple innervation of the sensory "spots", the nerve supply, he held, is so distributed that, under varying conditions, summation or inhibition of excitations may occur in varying degree. A hypothesis of this sort is, in Boring's opinion, adequate to the data of observation, and avoids the duplication of sensibilities which Head was led to assume.

One of the most important investigations of the cutaneous sense appearing in recent years is that of D. Katz (*Der Aufbau der Tastwelt, Zeitschrift für Psychologie und Physiologie des Sinnesorgane, Ergänzungsband 11*, 1925). After a brief critical survey of previous work, the author examines the various modes of appearance of touch experience, the efficiency of the sense of touch, the vibration sense, and other practical considerations. The vibration sense has taken on a popular interest because of the attempt to use it as a substitute for hearing in the deaf (see R. H. Gault, "On the Identification of Certain Spoken Words by their Tactual Qualities," *Journal of Applied Psychology*, 1926.) For a

review of recent investigations of cutaneous sensation, see *Psychological Bulletin*, 1926.

SENSATION. Organic. E. G. Boring (*American Journal of Psychology*, vol. xxvi) reported experiments on the sensations aroused by the stimulation of the alimentary tract. He used thermal, mechanical, chemical, and electrical stimulation. In the esophagus, sensations corresponding to all stimuli except pepper and mustard were reported; in the stomach, all were sensed, but it was not certain whether the sensations of cold, warmth, and electrical shock arose in the stomach or in the surrounding tissues. Hydrochloric acid was found to induce the sensation of hunger. The greatest error of localization occurred in the direction of the median line through throat and stomach, reference being often made to head, to throat, or to a point below the sternum.

Boring also made a qualitative study of experiences referred to the alimentary and urinary tracts (*Psychological Review*, vol. xxii). He concluded that, under favorable conditions, most of the experiences are introspectively reducible to various patterns of pressure and pain. Nausea was the most difficult experience to analyze. Experiments reported by A. J. Carlson (*The Control of Hunger in Health and Disease*, 1916) confirmed many of Boring's observations. Carlson, however, maintained that hunger is experimentally distinguishable from appetite; appetite, he held, may appear in the absence of hunger, and can be aroused by weak chemical stimuli which inhibit the hunger contractions.

SEPTIC TANKS. See SEWERAGE AND SEWAGE TREATMENT.

SERAFIN, TULLIO (1880–). An Italian conductor, born at Cavarzere. After graduation from the Milan Conservatory he joined the orchestra at La Scala as viola player. His successful début as conductor, with *Aida* in Ferrara, resulted in his engagement for the Teatro Regio in Turin, where he remained till 1908, when he succeeded Toscanini as principal conductor at La Scala in Milan. In 1914–15 he was at the Carlo Felice in Genoa, in the summer of 1915 in Havana, and during the winter of 1915–16 at the Opera Real in Madrid. He then served in the Italian Army, and after his return was once more at the Teatro Regio in Turin until 1921, when he went to the San Carlo in Naples. In the fall of 1924, he became connected with the Metropolitan Opera House, New York. He made frequent appearances as guest-conductor in Paris, London, Rome, and Buenos Aires. He ranks with the foremost operatic conductors of the world.

SERBIA. Formerly a Balkan kingdom with an area of 36,937 square miles. In December, 1918, it was proclaimed a part of the new Unitary State of the Serbs, Croats, and Slovenes (Yugoslavia). See JUGOSLAVIA for matters pertaining to population, industry, trade, finance, etc. For its history during the War, see WORLD WAR; for post-war history, see JUGOSLAVIA.

SERBS, CROATS, AND SLOVENES, KINGDOM OF. See JUGOSLAVIA.

SERING, MAX (1857–). A German political economist and agrarian political leader, who was born at Barby and educated at the Universities of Strassburg and Leipzig. He has been professor of political economy at the University of Berlin since 1897. His works include *Das Friedensdiktat von Versailles und Deutschlands*

wirtschaftliche Lage (1920); *Agrarikrisen unde Agrarzolle* (1925); *Die deutsche Wirtschaftskrisis* (1926), and *Germany under the Dawes Plan* (Eng. trans., 1928).

SETH, ANDREW. See PRINGLE-PATTISON, ANDREW SETH.

SETON, JULIA (1862-). An American lecturer and writer, born at Chicago. She was graduated from the Medical Department of the Denver-Gross College in 1898, and took post-graduate courses at Tufts Medical College. She practiced medicine in Denver and in Boston, and began metaphysical healing in the latter city in 1904. In 1906 she removed to New York City and there founded the New Thought Church and School. She lectured in the principal cities of the United States and in Europe, and wrote *Concentration—The Secret of Success* (1907); *Marriage* (1914), *The Race Problem* (1914); *Adrienne Le Baron*, a novel (1915); *Destiny*, a novel (1917); *The Outside and Inside of Life* and *The Self in Tune*.

SETON-WATSON, ROBERT WILLIAM (1879-). A British historian whose particular field of study was central Europe and the Balkans. He was educated at Winchester and New College, Oxford, afterward studying in Berlin, Paris, and Vienna. He was the founder and joint-editor of the *New Europe* (1916-20), and joint-editor of the *Slavonic Review*. He received honorary degrees at Prague and Zagreb universities, was an honorary member of the Rumanian Academy, and honorary lecturer in Eastern European History at King's College, London (1915-22). In the latter year, he was appointed Masaryk professor of central European history in the University of London. His works, the earlier of which were written under the pseudonym, Scotus Viator, were *Maximilian I* (1902); *The Future of Austria-Hungary* (1907); *The Southern Slav Question* (1911); *Absolutism in Croatia* (1912); *Rumania and the Great War* (1915), *The Balkans, Italy, and the Adriatic* (1915); *The Rise of Nationality in the Balkans* (1917), *Europe in the Melting Pot* (1919), *The New Slovakia* (1924); and *Sarajevo: A Study in the Origins of the Great War* (1926).

SEVCIK, sěv'tsik, OTAKAR (1852-). A Bohemian violinist (see VOL. XX). In 1921 he taught a master class at the Ithaca Conservatory of Music, and in 1922-23 a similar class at the Chicago Musical College. Not less than 700 of his pupils became teachers or orchestral performers in the United States alone. During his stay in this country, he put the finishing touches to his life work, a complete method for the violin, from the first rudiments to the last degree of virtuosity. The first section, *School of Intonation* (15 parts and two supplements, with English, German and French text), was published at New York in 1922; the second section, *School of the Virtuoso* (12 parts), was published in 1926. The work is not only the most voluminous and comprehensive of its kind, but seems destined to live as a lasting monument to the genius of one of the world's greatest teachers.

SEVILLE, sěv'ill or sě-vil', or sp. SEVILLA, sã-vel'ya. A city of Spain. The population in 1927 was estimated to be 215,107. In 1926 access to the port of Seville was improved by the construction of the Alfonso XIII Canal and the deepening of the Guadalquivir River so that vessels of 13,000 tons displacement might reach the port. A new large modern dock system also was installed. In 1928 a terminal for

the projected Buenos Aires-Seville air line was under construction, a distance of 44 kilometers (27.34 miles) northwest of the city. The facilities included an anchoring tower, two hangars, living quarters for the personnel, and factories to supply hydrogen, oxygen, and ethyl gas. The project was to be completed within three years at a total cost of 30,000,000 pesetas. In order to facilitate communication between the city and the airport, the municipality constructed a boulevard 50 meters (164 feet) wide. There has been developed an extensive suburban district.

The outstanding feature of Seville's development since the War was the Ibero-American Exposition which was held from March 15 to December 31, 1929. This exposition was first planned in 1910, and actual work on its construction was started in 1913. The War, however, postponed any further development of the plans until 1922, when the name of the exposition was changed from Hispano-American Exposition to Ibero-American Exposition, so that Portugal and Brazil might be included. The exhibits were confined to those from countries in the Iberian peninsula and those American nations discovered or settled by Spanish or Portuguese navigators and explorers. The exposition stressed particularly exhibits of fine arts, literature, and history. The site was a 2400-acre tract in Maria Luisa Park on the outskirts of Seville. The principal structure was the Plaza de España, built in a half circle with a central court 600 feet wide, and with 49 divisions in each of which there were exhibits of the 49 provinces of Spain. The buildings erected by Argentina, Bolivia, Brazil, Chile, Colombia, Cuba, Mexico, Peru, Santo Domingo, Venezuela, the United States, and Uruguay, in the best traditions of native architecture, were to serve as consulates after the exposition. The United States Congress appropriated \$700,000 for participation in the exposition, and a permanent pavilion designed by American architects after the Spanish Mission style of southern California was erected. The commercial exhibits were displayed in buildings entirely apart from the pavilions of the nations and the art galleries and Royal Pavilion.

SEWERAGE AND SEWAGE TREATMENT. Quick removal of soiled water used for domestic, office, and industrial purposes, together with its disposal without nuisance or menace to health, has received increasing attention in the twentieth century. Broadly, there was little change in collection materials and methods except in the growing use of concrete, plain or reinforced, for trunk and outlet sewers, generally precast in suitable lengths. Pumping plants, where required, were greatly improved and larger units employed where warranted by the volume of sewage, electric-driven pumps became more common, with automatic cut-in and cut-out control to suit changes in the volume of flow.

Final disposal of sewage reflected the increasing demand for a lessening of the pollution of the streams, lakes, or tidal waters into which all sewage must eventually go. The bulk of sewage, the world over, was still discharged into near-by or more remote waters with no treatment whatever or with but little, but with growing, attention to disposal into large volumes of diluting water, at points remote from sources

of public water supply, shellfisheries, and bathing beaches, or from foreshores where cast-up wastes or sludge banks would be objectionable to sight or smell. Where nuisance or health menace could not be ensured at reasonable cost by choice of remote outlet points, recourse to treatment was indicated, but much postponement in its provision was still common.

The degree and kind of treatment were governed by a variety of local conditions—physical, financial, and civic—all of which demanded, but did not always receive, careful weighing and balancing. Degree of treatment ranged from coarse or fine screens, alone or combined with sedimentation, for the removal of solid matter, to some or all of these combined, with processes for the further reduction of decomposable, oxygen-demanding and possible nuisance-producing organic matters. Where public health would otherwise be endangered, more or less complete removal of bacteria was demanded, most commonly to reduce the burden on water-purification plants, these being the last and main line of defense against water-borne disease.

Aside from continued improvements in fine screens and other mechanical devices forming a part of sewage works, the most notable advances in sewage treatment since 1914 were the introduction of the activated-sludge process, a combination of forced aeration and sedimentation; the extension of separate sludge digestion for the solids removed; one- and two-story (Imhoff) tanks, and by the activated-sludge process, and the utilization of gases produced by sludge digestion, to raise the temperature of sewage or sludge to produce power for sewage-works use, or, more rarely, to produce gas for sale. In 1929 where more than screening was in use, Imhoff, or two-story, tanks led (sedimentation compartment above, sludge digestion below); next came these tanks followed by trickling or sprinkling filters, and in some cases by secondary settling tanks, and sometimes by chlorination of the effluent for bacteria reduction.

The activated-sludge process was slowly but steadily growing both in number and size of plants—particularly in the United States, Canada, England, and Germany—most of the plants outside the United States being relatively small. Baltimore, Philadelphia, Rochester, Cleveland, and the Chicago Sanitary District had large Imhoff tank installations; the Chicago West Side plant, nearing completion, being by far the largest in the world, with an ultimate capacity to serve a population of 1,850,000. The Chicago Sanitary District also had the largest activated-sludge plant in the world, put in use Oct. 3, 1928, to serve 830,000 people by 1930. Next in size came the activated-sludge plants of Milwaukee and Indianapolis. Late in 1928, designs were started for a large activated-sludge plant to serve about 1,000,000 people in the Boroughs of Manhattan and the Bronx, or a fifth of the population of New York City. Some idea of the work that is required to make plans for such a plant may be had from the fact that \$605,500 was to be paid for the design of the plant alone, under contract with a consulting engineer.

The sewage from the cities of Paris and Berlin still went to sewage farms in 1929, but they had been overworked for years and some preliminary treatment had been provided and more was contemplated. Except in low-rainfall areas, sewage farming never gained a foothold in the United States, and in Europe

it was little practiced in 1929. A notable example of sewage screening is afforded by Los Angeles, where the sewage of the city passes through an immense installation of fine screens before being discharged offshore into the Pacific Ocean.

Activated-Sludge Process. In this process, the sewage, either as it comes to the works or after preliminary treatment to remove some of the solids, is first passed through activation tanks, then through settling tanks. The process effects a heavy reduction of suspended solids, decomposable matter, and bacteria. Some of the sediment (sludge) in the settling tank is forced back into the activation, or aeration, tank and ultimately kept mixed with the sewage, either by means of compressed air or by mechanical stirring devices, such as revolving paddles. Where mechanical agitators are used, free air is drawn into the sewage from the atmosphere, otherwise, compressed air is admitted at the bottom of the activation tanks through porous plates or perforated pipe, generally the former. From the aerating tanks, the sewage and admixed sludge go to settling tanks; from these, some of the sludge is forced back to the aeration tank, while the excess activated sludge is removed for final disposal.

This sludge has a higher fertilizing value than that from other processes, but to make it commercially available, its moisture content must be reduced to 10 per cent. Because of the high first and operating costs of sludge presses and driers, few cities having activated-sludge plants had attempted to utilize excess activated sludge up to 1929, the chief examples being Milwaukee, Houston, and Pasadena. At Milwaukee, the operating revenue from the activated-sludge process in 1928 was put at \$600,000 against \$900,000 operating expense, making the net cost of sewage treatment \$300,000, but with no allowance for capital charges. As a rule, excess activated sludge, up to 1929, was got rid of by dumping on land, after more or less dewatering in digestion tanks, in lagoons, or otherwise.

Chicago Drainage Canal and Lake Lowering Controversy. Decisions of the United States Supreme Court on Jan. 5, 1925, and Jan. 14, 1929, combined with the rapid growth of Chicago and the 59 other communities making up the Chicago Sanitary District, will speed up a programme already under way for the largest group of high-degree sewage-treatment plants under one governmental authority anywhere in the world. These decisions (see *Engineering News-Record*, Jan. 1 and 15, Mar. 2, 1925; Dec. 1, 1927; Jan. 24, and Mar. 7 and 14, 1929, for the decisions and related matters) established (1) that the district was dependent on the Secretary of War for authority to divert any water from Lake Michigan, was exceeding the amount granted, and must carry out such a programme of rectification as that officer might set up, and (2) that the Secretary of War, under congressional legislation bearing on navigation, had no authority to authorize diversion of water for sanitation alone, although in the case at bar a "negligible" (comparatively speaking) amount of water might be diverted to protect navigation from injury by sewage pollution.

The decision resulted from a suit brought by all the States bordering on the Great Lakes, except Illinois and Indiana. The terms of a court decree to put the decision into effect were

referred to Charles Evans Hughes for report and recommendation, after hearing from experts. Apparently, the Sanitary District will be compelled to treat to the highest degree of the art the sewage of a population equivalent to 7,000,000 (sewage from human population plus organic wastes). The City of Chicago will also have to purify its water supply to a high degree. The court held that diversion of water from Lake Michigan materially lowered the levels of the Great Lakes and caused serious injury to navigation.

The purpose of the drainage canal was to divert sewage from Lake Michigan for the protection of the Chicago water supply, at the same time affording a scientifically-devised means of sewage disposal by dilution. The rate of dilution, as recommended by three engineers, headed by an eminent sanitarian, would have been 4 cu. ft. of water per 1000 population, but this was reduced to $3\frac{1}{2}$ cu. ft. in the legislative act creating the Sanitary District of Chicago, passed in 1889. The canal was put in use Jan. 1, 1900. When the engineers recommended the project of sewage disposal in 1887, there were almost no sewage-treatment plants in the United States and those were very small.

Sewerage-Service Rentals. Except that here and there sewers were built by private companies (see MUNICIPAL OWNERSHIP), almost unexceptional world-wide practice until well in the twentieth century was to make no annual charge for sewer and sewage disposal service. From about 1915, sewerage was put on a so-called utility basis in a number of States which passed enabling acts to that effect. The chief object of the plan is to provide funds more readily for a service that is growing in importance and extent. The charge is generally at least coordinated with that for metered water supply, and sometimes both services are billed together.

Rational Control of Water Pollution. Much attention was given to the classification of streams and other natural bodies of water with a view to putting regulations designed to prevent pollution on a more rational basis than formerly. A notable example of this is afforded by the report on the pollution of boundary waters between the United States and Canada, made in 1918 by the International Joint Commission created many years earlier by a treaty between Great Britain and the United States. The waters involved include the Great Lakes, the Rainy, St. Mary's, St. Clair, Detroit, and Niagara rivers and to some extent the St. Lawrence as well. The studies were conducted by eminent engineers, chemists, and bacteriologists in official and private life in the United States and Canada.

The report recognizes that the utilization of rivers and lakes to receive the sewage of cities is a legitimate and proper function so long as this can be done without menace to public health or the creation of nuisances by offense to sight and smell, and also that the amount of sewage which may properly be discharged into adjacent waters by any city should be determined by a careful study of all governing local conditions, including particularly whether or not public water supplies would be endangered by the sewage, and if so the permissible burden on water-treatment plants. This burden, the report states, should not exceed 500 bacteria of the colon type per cubic centimeter as an

average for the year, determined by samples taken in a manner specified in some detail. The report proposed that before discharge into the Detroit and Niagara rivers, sewage should be treated to such a degree that the water receiving it would correspond to sewage diluted by a stream flow of 4 cu. ft. per second per capita of contributing population.

In Pennsylvania, the Sanitary Water Board, composed of representatives of State departments having to do with health, fisheries, and other aspects of the waters of the State, in 1923 divided the streams of the State into three general classes, according to degrees of pollution and uses to which the streams are put, and established general principles to control their pollution. The New Jersey Legislature of 1924 created a Sanitary and Economic Water Commission. In 1922 the Pennsylvania and New Jersey Departments of Health divided the interstate portion of the Delaware River into three zones and laid down conditions as to the degree of sewage treatment that each department would require, in passing on plans for sewage works in each zone.

In Great Britain, through what appears to be cooperative work carried on by the Ministries of Agriculture, Fisheries, and Health, the rivers were divided into three classes: (1) those sufficiently pure to support a considerable stock of fish; (2) those polluted but nevertheless still containing a great number of fish; (3) rivers grossly polluted and containing few if any fish. It was expected that further control of stream pollution through the joint efforts of these ministries would take this classification into account. For preliminary report of the Steinman Committee on River Pollution, see abstract in the *London Surveyor*, Jan. 11, 1924.

SEYFFERT, LEOPOLD (GOULD) (1888-). An American artist, born at California, Mo. He studied at the Pennsylvania Academy of Fine Arts and, after winning two foreign scholarships, continued his artistic education in Paris and Spain. In 1912 he gained the fellowship prize of the Pennsylvania Academy of Fine Arts, a gold medal of the Art Club of Philadelphia in 1913, a silver medal at San Francisco in 1915, the Hallgarten Prize in 1916, the Altman Prize of the National Academy of Design in 1917, the Beck Gold Medal in 1918, the Temple Gold Medal in 1921, and the Proctor Prize in the same year. From the Art Institute of Chicago he received the Palmer Gold Medal in 1923, the Logan Gold Medal in 1924, and the Hearst Prize in 1924. The Pennsylvania Academy of

Fine Arts awarded him the Stotesbury Medal in 1926. His work is represented in several of the most important art galleries in the country.

SEYMOUR, CHARLES (1885-). An American educator and historian, born at New Haven, Conn. He was graduated from Cambridge University in 1904 and from Yale in 1908, taking postgraduate courses at the latter and in Paris. In 1911 he was appointed instructor in history, in 1918 professor of history, and in 1927 provost at Yale. At the Peace Conference in Paris in 1919, he was chief of the Austro-Hungarian Division of the American Commission to Negotiate Peace, and was also delegate on other commissions dealing chiefly with the Balkans. Among his writings are *Electoral Reform in England and Wales* (1915); *The Diplomatic Background of the War* (1916); *How the World Votes*, with D. P. Fiary (1918); *Woodrow Wilson and the World War* (1921). He edited, with Col. E. M. House, *What Really Happened at Paris* (1921). Professor Seymour arranged as a narrative *The Intimate Papers of Colonel House* (4 vols., 1926-28).

SHACKLETON, shák'l-ton, SIR ERNEST (HENRY) (1874-1922). An English Arctic explorer (see Vol. XX). From 1914 to 1916, he was on an Arctic exploring trip. In 1919, at Archangel, his knowledge proved invaluable in providing comforts for the soldiers there. In 1921 he undertook his last Arctic voyage, which was to be a 30,000-mile journey in the South Atlantic and the Antarctic. He died off the whaling point, Grytviken, on South Georgia Island and was buried there. By a strange chance, Grytviken had been the jumping-off point of his 1914 expedition. See POLAR RESEARCH.

SHAFFER, PHILIP ANDERSON (1881-). An American biological chemist. He was born at Martinsburg, W. Va., and graduated at West Virginia University. After graduate studies at Harvard (Ph.D., 1904), he became instructor in chemical pathology at the Cornell University Medical College in New York City (1904-10). Since 1910 he has been professor of biological chemistry at the Washington University Medical School, St. Louis, Mo. In the World War, he served as major of the Sanitary Corps, U. S. Army, assigned to the Chief Surgeon, A.E.F. He was president of the American Society of Biological Chemists in 1923-24, and in 1928 was elected to the National Academy of Sciences. He has conducted researches in diet, in treatment of typhoid fever and nutrition in that disease (with Warren Coleman), and also on metabolism in diabetes and on the preparation of insulin.

SHALIAPIN. Transliteration for CHALIA-PINE, which see.

SHANDAKEN TUNNEL. See TUNNELS.

SHANNON, CHARLES HAZELWOOD (1865-). An English painter (see Vol. XX). His later works include "The Embroidered Shawl" (1918) and the lithographs, "Ebb Tide" (1917), "The Tidal River" (1919), and "A Sharp Corner" (1919). He also painted portraits, including those of Princess Patricia of Connaught, Lillah McCarthy, and Hilda Moore ("The Lady in Black"). He became a member of the Royal Academy (1921), and an associate of the Société Nationale des Beaux Arts.

SHANNON, EFFIE (1867-). An American actress, born at Cambridge, Mass. She began to act at 10 years of age, as Eva in *Uncle Tom's Cabin*, and appeared as an ingenue in many popular plays. She played with Rose

Coghlan in *Diplomacy*, with Herbert Kelcey in *The Moth and the Flame*; *His Lord and Master*; *The Thief*, etc. She took part in *The Years of Discretion* under the direction of David Belasco during 1913-14 and played in *Children of Earth* in 1915. She also appeared in *Under Orders*, *Mama's Affair*; *The Detour*, under Belasco's management, 1923-24, and under the management of George Tyler, 1926; and in *Merry Andrew*, by Lewis Beach (1929).

SHANNON, FREDERICK FRANKLIN (1877-). An American clergyman and author, born in Morris County, Kan., and educated at Harvard University. He was ordained to the ministry of the Methodist Episcopal Church, South, in 1899, and after preaching in West Virginia and in Grace Church and the Reformed Church on the Heights in Brooklyn, N. Y., he became pastor of the Central Church in Chicago in January, 1920. His writings include *The Soul's Atlas and Other Sermons* (1911), *The New Personality* (1915), *The Enchanted Universe* (1916); *The Breath in the Winds* (1918); *God's Faith in Man* (1919), *The Economic Education*, *The Land of Beginning Again*; *The New Greatness*.

SHANTUNG, shàn'tōōng'. A Chinese maritime province with an area of 55,970 square miles and a population estimated at 30,803,245. The scene of Germany's pre-war development of Kiaochow Bay, this province attracted world attention in 1915 when Japan presented the notorious Twenty-One Demands to China, following the capture of the German leased territory during the World War. China's protest against clauses in the Versailles Peace Treaty giving Japan virtual sovereignty over the leased area and economic sovereignty over the entire province was carried to the League of Nations. It finally resulted in a Sino-Japanese agreement, signed at the Washington Conference, Feb. 4, 1922, under which the leased area of Kiaochow was returned to China, Japanese troops withdrawn from Shantung, and the Tsingtau-Tsinanfu Railway sold by Japan to China, thus reestablishing full Chinese sovereignty. See CHINA, under *History*; JAPAN, under *Foreign Policy*; WORLD WAR; LEAGUE OF NATIONS; WASHINGTON CONFERENCE.

SHANTZ, HOMER LE ROY (1876-). An American botanist, born in Kent County, Mich. He was graduated from Colorado College in 1901 and took postgraduate courses at the University of Nebraska. He was professor of botany and bacteriology at the University of Louisiana (1907), served as special agent in the United States Bureau of Plant Industry, and from 1910 to 1926 was plant physiologist in charge of various investigations. He was agricultural explorer for the Smithsonian Institution African Expedition in 1919-20, and carried on other explorations in Africa. From 1926 to 1928, he was professor of botany at the University of Illinois and since 1928 has been president of the University of Arizona.

SHAPLEY, HARLOW (1885-). An American astronomer, born at Nashville, Mo. He studied at the University of Missouri, and received his Ph.D. from Princeton in 1913. In 1914, he became astronomer at Mt. Wilson Observatory of the Carnegie Institution, remaining there until 1921 when he accepted the directorship of the Harvard Observatory. His original investigations were devoted to studies in photometry and spectroscopy, as well as the orbital theory and computation on which he contributed

important papers to the literature of astronomy. He was awarded the Draper Medal by the National Academy of Sciences in 1926. In 1928 he announced evidence that the stars are continually fed by vast showers of meteors. He is a member of the National Academy of Sciences and served as president of the American Association for the Advancement of Science.

SHARLOW, MYRNA DOCIA (1893-). An American dramatic soprano, born at Jamestown, N. D. Having studied piano and voice at the Beethoven Conservatory, she continued her vocal studies with F. E. Bristol (1911-13) and with E. Clément in Paris (1914). Her operatic repertory she acquired under Campanini, Moranzoni, Weingartner, and S. Wagner. She made her début with the Boston Opera Company as Stella in Offenbach's *Contes d'Hoffmann* (Nov. 25, 1912) and sang with that organization until 1914, and later with the San Carlo Opera Company of Naples, Italy. From 1915 to 1921, and again after 1923, she was a member of the Chicago Opera Association. In 1914 she appeared at Covent Garden. She is gifted not only with a glorious voice, but also is a splendid actress. Her favorite rôles are Tosca and Brunnhilde in *Siegfried*. In 1921 she married Edward B. Hitchcock.

SHARP, WILLIAM GRAVES (1859-1922). An American diplomat (see Vol. XX). He was a member of Congress from Ohio from 1909 to 1914, resigning in the latter year following his appointment as Ambassador to France, in which office he served until 1919. He was elected a Foundation member of the Société Astronomique de France, having been a lifelong student of astronomy. He was awarded the Grand Cross and Legion of Honor in recognition of his services as ambassador.

SHARPE, HENRY GRANVILLE (1858-). An American army officer, born at Kingston, N. Y., and graduated from the United States Military Academy in 1880. Most of his official employment was in the commissary department. He had charge of the relief of flood sufferers at Cairo, Ill., and Memphis, Tenn., in 1897, and was on duty in Porto Rico in 1898, in the Philippines from 1902 to 1904, and in France in 1919. He was promoted to be major general in 1918 and retired in 1920. He wrote: *The Art of Subsisting Armies in War; The Art of Supplying Armies in the Field as Exemplified during the Civil War; The Provisioning of the Modern Army in the Field; The Quartermaster Corps in the Year 1917 in the World War* (1921).

SHAW, GEORGE BERNARD (1856-). A British author and dramatist (see Vol. XX). He received the Nobel Prize for literature in 1925. In 1914 he wrote *Common Sense About the War*, which was so outspoken as to offend many, and throughout the World War he aroused considerable irritation by what was considered untimely defense of the Germans and fault-finding with the Allies. Other later books were: *How to Settle the Irish Question* (1917); *Peace Conference Hints* (1919); and the plays: *The Music-Cure* (1914); *O'Flaherty V.C.*, *The Inca of Perusalem* (1915); *Augustus Does His Bit* (1916); *Heartbreak House* and *Annajanska* (1917); *Back to Methuselah*, a cycle of five plays (1921); *Jatta's Atonement*, a translation of *Frau Gitta's Suhne*, by Siegfried Trebitsch (1922); *Saint Joan of Arc* (1923), which was played in New York City in 1924; and *The Apple Cart* (1929). He also wrote *The Intell-*

gent Woman's Guide to Socialism and Capitalism (1928). Consult *The Quintessence of Bernard Shaw*, by Henry Charles Duffin (1920); *Bernard Shaw*, by Edward Shanks (1924); *Bernard Shaw Explained; a Critical Exposition of the Shawian Religion*, by George Whitehead (1925); and *A Guide to Bernard Shaw*, by Edward Wagenknecht (1929).

SHAW, JAMES BYRNE (1860-). An American mathematician, born at Remington, Ind. He studied at Purdue University. During 1890-98, he was professor of mathematics at Illinois College, and later held a similar chair at Kenyon College. From 1903 to 1910, he was professor of mathematics at the James Milliken University, and in the latter year was called to the University of Illinois, where in 1918 he became professor. In addition to many mathematical papers he wrote *Synopsis of Linear Associative Algebra* (1907); *Lectures on the Philosophy of Mathematics* (1918); and *Vector Calculus* (1922).

SHAW, J(OHN) W(ILLIAM) (1863-). An American Roman Catholic Archbishop, born at Mobile, Ala. He was educated at the Academy of the Brothers of the Sacred Heart at Mobile, and at St. Finian's Seminary in Ireland. He studied also at the University of the Propaganda at Rome, and was ordained to the priesthood in 1888, becoming assistant in the cathedral at Mobile, and assistant and missionary in St. Peter's Church, Montgomery, Ala., and, in 1891, rector of the cathedral of Mobile and chancellor of the diocese. In 1910 he became Coadjutor Bishop of San Antonio, Texas, and in 1911 bishop. In 1918 he was consecrated Archbishop of New Orleans.

SHAW, Rt. Hon. Tom (1872-). An English labor leader, born at Colne, Lancaster. He began work in a cotton mill when but eight years old. He was self-educated, mastering French and German so thoroughly that he was one of the most skillful interpreters at the international labor conferences which he attended and for which he was frequently secretary. One of the ablest speakers in the English labor movement, and possessed of a thorough knowledge of industrial problems, he entered Parliament in 1918, and the next year was made a Commander of the Order of the British Empire. Ramsay MacDonald appointed him Minister of Labor in 1924, and in the same year he was made a member of the Privy Council. In the Labor cabinet formed in June, 1929, he was Secretary of State for war.

SHEAR, THEODORE LESLIE (1880-). An American archaeologist. He was born at New London, N. H., and graduated at New York University (Ph.D., Johns Hopkins, 1904). He studied at the American School at Athens and the University of Bonn; was instructor in Greek and Latin, Barnard College, New York City (1906-10), and since 1911 has been associate in Greek at Columbia. In 1921 he began lecturing on art and archaeology at Princeton. In the World War, he served as first lieutenant in the Air Service, U. S. Army. He conducted archaeological excavations at Cnidus (1911), Sardis (1922), and Corinth (1925). In 1929 he was appointed by the American School of Classical Studies as director of the excavation of the Agora, or ancient market place, at Athens. He is the author of *Influence of Plato on St. Basil* (1907); *Sardis-Archæological Terracottas* (1925); and articles in archæological periodicals.

SHEEP. See LIVE STOCK.

SHELFORD, VICTOR ERNEST (1877–). An American zoölogist, born at Chemung, N. Y., and educated at the University of Chicago. He was assistant in zoölogy (1900–01) at West Virginia University; assistant (1904–07), associate (1907–09), and instructor (1909–14) in zoölogy at the University of Chicago; assistant, and associate professor (1914–27), and professor (from 1927) at the University of Illinois, and biologist in charge of the research laboratories of the Illinois Natural History Survey (from 1914). He has been active in developing research on ecology and has published *Animal Communities in Temperate America* (1913). He was also the compiler of *Naturalists' Guide to the Americas* (1925).

SHELL. See PROJECTILE.

SHELL SHOCK. See PSYCHOLOGY.

SHEPPARD, MORRIS (1875–). A United States Senator (see VOL. XX). He was reelected to the Senate from Texas in 1918 and in 1924 for the term expiring in 1931. He has been a member of the Senate committees on commerce, irrigation and reclamation, manufactures, and military affairs.

SHERMAN, STUART PRATT (1881–1926). An American author, critic, and editor, who was born at Anita, Iowa. He was educated at Williams College and Harvard (Ph D., 1906), and after a year as instructor of English at Northwestern University went to the University of Illinois in 1907 as associate in English. He became professor of English there in 1911, leaving this post in 1924 to become literary editor of the *New York Herald Tribune*. In 1926 he was drowned in an accident on Lake Michigan. He wrote *Matthew Arnold* (1917); *On Contemporary Literature* (1917); *Americans* (1922); *The Genius of America* (1923); *Men of Letters of the British Isles*, with Theodore Spicer-Simson (1924); *My Dear Cornelia* (1924); and *Points of View* (1924). He was an associate editor of the *Cambridge History of American Literature* (1917) and edited various other works. Consult *Life and Letters of Stuart P. Sherman*, by Jacob Zeitlan and Homer Woodbridge (1929).

SHERILL, CHARLES HITCHCOCK (1867–). An American lawyer and diplomat, born in Washington. He was graduated from Yale in 1889 and from the law school of that university in 1891, practiced law in New York for several years and in 1909 was appointed Minister to Argentina. He served until 1911, when he was obliged to resign from the diplomatic service on account of ill health. In 1912 he resumed the practice of law. He was active in athletics and was the originator of several series of national and international sports. During the World War, he served as brigadier general and adjutant general of the State of New York. He is the author of *Stained Glass Tours in France* (1898); *Stained Glass Tours in Italy* (1913); *French Memories of Eighteenth Century America* (1915); *Modernizing the Monroe Doctrine* (1916); *Have We a Far-Eastern Problem?* (1920); *The Purple or the Red* (1924); *Stained Glass Tours in Germany* (1927).

SHERINGTON, SIR CHARLES SCOTT (1861–). A British physiologist educated at Cambridge, where he received a degree in medicine in 1892. He was professor of physiology in the University of Liverpool from 1895 to 1913 and resigned to become Waynflete professor of physiology at Oxford. He was formerly Brown

professor of pathology in the University of London and Fullerian professor of physiology in the Royal Institution of Great Britain. In 1927 he lectured at Harvard and before the Canadian Medical Association at Toronto. He is best known for his researches into the repair of nervous tissue and his major works have been *The Integrative Action of the Nervous System* (1906) and *Mammalian Physiology* (1916). He was knighted in 1922 and received the Order of Merit in 1924. In 1925 he published a volume of verse, *The Assaying of Brabantius*.

SHIDEHARA, BARON KIJURO (1872–). A Japanese diplomat and Minister of Foreign Affairs, who was born in Nara-ken and graduated in law from the Imperial Tokyo University (1895). After entering the Department of Agriculture and Commerce, he transferred to the diplomatic service and served in consulates at Chemulpo, London, Antwerp, as secretary at the Tokyo office (1911), embassy counselor at Washington (1912), and Minister to The Hague (1914–15). In the latter year, he became Vice Minister of Foreign Affairs. From 1919 to 1922, he was Ambassador to Washington and from 1924 to 1927, Foreign Minister in the successive Kato cabinets. He again held the portfolio for Foreign Affairs in the Liberal cabinet formed by Premier Hamaguchi in July, 1929. As Foreign Minister, he attempted to settle Japan's international problems through a policy of understanding and cooperation. He was created a baron in 1920.

SHIP, ARMORED. See VESSEL, NAVAL.

SHIP, MERCHANT. See SHIPBUILDING; SHIPPING.

SHIP, NAVAL. See VESSEL, NAVAL.

SHIPBUILDING AND NAVAL ARCHITECTURE. The design and construction of naval vessels, as well as of merchant ships, fall under this head; but, for convenience of grouping, they are treated under NAVIES OF THE WORLD and VESSEL, NAVAL. After the extensive war losses and the diversion of merchant vessels to war purposes, the Allies' shortage in shipping stimulated shipbuilding to a very unusual extent—particularly in the United States, where the tonnage in the foreign trade was increased from about 1,100,000 gross tons in 1914, to 11,077,397 in 1921, and the total tonnage from 5,368,194 to 18,282,136. Construction in nearly all countries reached its peak in 1920 and then dropped sharply because of the return of ships to peaceful trade, the extensive building, and the slowness with which business, especially overseas commerce, picked up after the War. By 1923 a very large part of the seagoing tonnage was laid up; in the United States—exclusive of vessels on the Great Lakes and in the coasting trade—more than half the tonnage was idle.

After 1923 world trade steadily improved and the idle vessels began to be absorbed. New factors now became of importance. Many of the American ships which were built during the stimulation of construction, caused by an appreciation of war losses and war necessities, were found lacking in desirable qualities. Those with concrete or wooden hulls were definitely discarded. Standard and fabricated ships, especially the former, were less objectionable, but the propelling machinery in both classes was becoming antiquated and relatively inefficient.

In many of the most suitable of the war-built ships, steam machinery was replaced by Diesel

motors, and others were likely to be so refitted in the future. The numbers and tonnages of vessels of more than 100 gross tons that were launched during the year ending Dec. 31, 1927, are shown in the accompanying table.

I		
MERCHANT VESSELS OF MORE THAN 100 TONS GROSS LAUNCHED IN 1927		
Country	Number	Tons, gross
U. S., Atlantic and Gulf	47	107,554
Pacific Coast	11	16,716
Great Lakes	8	54,948
U. S., total	66	179,218

Norway	12	5,363
Russia	18	43,917
Spain	5	22,899
Sweden	18	67,361
Uruguay	5	3,000
World total	802	2,285,679

Table I includes no vessels of less than 100 tons nor those which are not included in Lloyd's Register. In Great Britain and Ireland, these omissions amount to about 17 per cent of the total tonnage built in the year ending June 30, 1928. In the United States, according to the report of the Department of Commerce, there were built, in the fiscal year 1927-28, 969 vessels of 257,180 tons; and on July 1, 1928, there were building or under contract 483 vessels of 264,410 tons, including 12 steel passenger steamers of 75,258 tons, 4 steel cargo steamers of 32,228 tons, 2 steel tankers of 13,116 tons, and 1 ferry steamer of 2767 tons. In all cases, the figures are for gross tons. The numbers and tonnages of merchant vessels under construction in the various countries of the world on June 30, 1928, are given in Table II. The figures are derived from Lloyd's Register of Shipping.

World total	587	2,521,342	161	497,580

About 1924 the development of large passenger vessels in the transatlantic and other trades began to renew its course which the War had interrupted. Until 1927 the largest of the post-war vessels that were produced were of mod-

erate tonnage; but in that year the French liner, *Ile de France*, of 40,000 gross tons and 24 knots speed, was completed; and building competition was reestablished. The Italian motor liner, *Augustus*, of 19 knots and 32,650 tons—the largest motor ship yet completed—entered service in 1928. The American passenger ship, *California*, the largest merchant vessel ever built in the United States, and the largest one in the world to be fitted with electric drive, also made her first voyage in 1928; a sister ship, the *Virginia*, was completed early in 1929; and the *Pennsylvania*, of similar type, but 4000 tons larger, was finished and entered service in October, 1929. Both the *California* and *Virginia* are of 20,325 gross register tons; the extreme length is 601 25 feet; beam, 80 feet; speed, 18 knots; displacement at normal load draft, 30,250 tons. They are fitted to carry 384 first-class passengers and 363 tourist passengers, and have a cargo capacity of 578,700 cubic feet, of which 100,000 is refrigerated space. They are employed in the New York-San Francisco trade via the Panama Canal. The *Pennsylvania*, of the same line, was launched in October, 1929.

The new American Transatlantic line, which in February, 1929, purchased the *Leviathan* and 10 other large passenger ships from the Shipping Board (see SHIPPING: *United States Shipping*), is required by the terms of the sale to lay down two very large and fast liners for service with the *Leviathan* and has announced its intention to build five others of smaller size—three of 35,000 gross tons and two of 25,000—in the next 10 years. For additional information concerning the recent operations of the Shipping Board, see SHIPPING: *United States Shipping*.

Two new German passenger steamers of 46,000 tons and 20 5 knots were launched in 1928 for the North German Lloyd Company. One of these was delayed in completion by a very serious fire, but the *Bremen* made her first voyage in July, 1929, and reduced the previous Cherbourg to New York record by eight hours and fifty-two minutes, covering the distance in 4 days, 17 hours, and 42 minutes. The average speed for the voyage was reported to be 27 83 knots; the longest day's run, 713 nautical miles; and the average speed for this day, 29 71 knots. The average daily speed increased steadily and indicated faster trips in the future.

The effects of the *Bremen*'s successful passage were immediate and notable. The White Star

Company scrapped the beginnings of a 60,000 ton liner which had been laid down at Belfast. The construction of two large steamers for the Cunard Line straightway was deferred or delayed; while less advanced projects in both America and Europe were being subjected to further study and examination. The leading question is that of speed. It is highly desired, but it is expensive. A moderate cut in the record would have earned but a ripple of interest. But a nine-hour gain on the first voyage, with the certainty of greater speed when pressed, was too much for the equanimity of the other ship owners. As a matter of prestige all the great passenger lines were apparently considering the construction of one or more large and fast vessels to exceed in speed all possible efforts of the *Bremen*; but the desire to lead the way in the new race was curbed by new questions of size, speed, probable economics of operation and advertising, and the possible attitudes of competing lines.

Propelling Machinery. The four principal types of marine engines now in use are (a) the reciprocating steam engine, (b) the turbine (or rotary) steam engine, (c) the internal combustion engine, and (d) electric drive.

In a marine reciprocating engine, the steam develops its power while expanding in one or more cylinders, driving in each a piston that is connected to a crank on the propeller shaft. The majority of existing engines are of the triple-expansion type, i.e., the steam passes through three cylinders, effecting one stage of its total expansion in each. The first, or high-pressure cylinder, receives the steam from the boilers and the third, or low-pressure cylinder, is connected to the condenser. As the volume of the steam increases, the sizes of the cylinders increase and the steam, in its third stage of expansion, is frequently divided between two small low-pressure cylinders instead of using one large one. During its many decades of development, the reciprocating engine attained reliability of action, simplicity, endurance, and ease of repair; but it is less economical under many conditions than the newer types, produces objectionable vibrations in hull and engine structures, and is not so well adapted to very high powers and speeds.

The steam turbine is slowly but steadily displacing the reciprocating engine—less slowly in fast vessels. The Parsons reaction turbine, which is used in the majority of marine turbine installations, is briefly as follows. The rotor, or driving mechanism, consists of a shaft to which are secured one or more short cylinders, the smallest at the steam end and the largest at the exhaust. Each cylinder has circumferential grooves in which thin, slightly curved, blades are firmly set at a considerable angle with the direction of the axis. It is surrounded by a hollow cylinder which has on its inner surface similar rows of blades that extend inward between the rows of blades on the cylinders. The reaction of the pressure of the steam, as it passes through row after row of the blades, turns the rotor, which in early types was directly connected to the propeller shaft. As the pressure falls, the length of the blades is increased, the diameter of the casing being expanded to permit this. When the length of the blades reaches the permissible limit, a larger cylinder is introduced. The process of expansion then goes on and is usually carried into one or more additional turbines before the limit of expansion is reached. As the turbines always turn in one direction, going astern is ef-

fected by means of a separate "backing" turbine that revolves in the opposite direction to the main turbines. In the earlier turbine installations, such as are here described, the efficiency of propulsion was much reduced by too high a speed of the propeller and too low a speed of the turbine. By introducing reduction gearing between the turbine and propeller shafts this difficulty was obviated at the designed speed and reduced at other speeds.

The normal marine internal-combustion motor for propelling vessels is a modification of the Diesel heavy-oil engine. It differs materially from the gasoline engine. The fuel chiefly used is crude oil, from which the gasoline and kerosene have been removed, with a flash point of 510° F. or more. It is injected into a cooled combustion chamber where the heat of compression automatically ignites it. The different types are too numerous for description here. They are divided into 4-stroke-cycle and 2-stroke-cycle classes. Both classes have single-acting and double-acting types, while the 2-stroke has in addition the opposed-piston type of one or three cranks per cylinder. Practically all of these types are fitted either with air or airless injection.

The system of electric drive was designed to overcome some of the defects of steam turbines and heavy-oil motors. Powerful electric rotors are connected to the propeller shafts. The current for these is furnished by generating sets driven by steam-turbine engines or heavy-oil motors which are normally operated at their most efficient speeds. By varying the current supplied to the rotors, any desired speed may be given the ship without material loss of efficiency—at any sustained speed with practically no loss.

On Jan. 1, 1928, nearly 79 per cent of the world's steam and motor tonnage (excluding vessels of less than 100 gross tons) used reciprocating engines, less than 15 per cent were fitted with steam turbines, and only a little more than 6 per cent were motor ships (only 2 per cent in 1923). Of the vessels building at the end of 1928, however, about one-half were designed with internal-combustion engines of the heavy-oil type. The increasing demand for motor ships in many services in causing the removal of the reciprocating steam engine from many ships and the substitution of motor machinery. In 1927 the completion of the *California* in the United States and, in 1929, the *Peninsular & Oriental Steam Navigation Company's liner, Viceroy of India*, in Great Britain, marked the serious advent of electric drive into the field of merchant marine propulsion; and this was further emphasized by the selection of this sort of machinery for the new White Star ship.

Unlike Diesel motors, electric drive offers no obstacles to size or speed. The great U. S. Navy aircraft carriers, *Leaington* and *Saratoga*, of 33,000 tons and 35 knots, have a shaft horse power of 180,000—exceeding by far that of any other vessels, merchant or naval, while the speed is greater than that of any vessel in existence of more than 10,000 tons. These were the first large and fast ships fitted with electric drive; judging from their behavior on long trips, they could maintain across the Atlantic a speed exceeding that of any existing merchant vessel by six or seven knots. In case of control from the bridge, capability of reversal of the engines, and strength of backing power, electric drive greatly

exceeds geared turbines, thereby making the ship considerably safer at sea and in crowded waters.

Whether the generating units should be driven by relatively small steam turbines or by Diesel motors is a problem which will require time and experience to solve. Geared turbines have the advantages, over turbo-electric drive, of less weight, less floor space, and somewhat greater fuel efficiency when operated continuously at the designed speed. Improved Diesel-electric installations may effect economy in these directions. Since the War, the use of geared turbines for large fast vessels of all kinds has steadily increased. Because of the great demand for the steam turbine and the Diesel motor, the use of reciprocating steam engines has slowly decreased, except for vessels of certain types and for certain trades. In some recent installations, reciprocating engines have been added to turbines to improve the backing and manœuvring powers, and to Diesel engines to give these advantages and to improve the fuel efficiency. Of the former class, there are many examples; of the latter, the Scott-Still engine is one of the latest types.

On account of the increasing steam pressure used in modern marine steam engines, the employment of water-tube boilers and superheating arrangements is constantly growing. All the new fast steamers are fitted with oil-burning boilers and a large number of the older boilers have been changed from coal to oil burning. The use of pulverized coal in place of fuel oil has been tried with excellent results. Pulverized coal in place of oil in internal-combustion engines has been under test in land machinery for many years. While the results attained are good, its value in marine propelling machinery as yet is undetermined.

United States Shipping Board. This board was created by the Shipping Act of 1916 (approved Sept. 7, 1916). The object of the act, as stated in its title, was "to establish a United States Shipping Board for the purpose of encouraging, developing, and creating a naval auxiliary and naval reserve and a merchant marine to meet the requirements of the commerce of the United States with its territories and possessions and with foreign countries; to regulate carriers by water engaged in the foreign and interstate commerce of the United States; and for other purposes." The board thus established consisted of five (increased to seven by subsequent legislation) commissioners. It was given wide powers; to build, purchase, lease, charter, or sell ships; to make rules and regulations in regard to shipping; to form corporations for the purchase, construction, equipment, lease, charter, or maintenance of merchant vessels of the United States; and to perform and control other matters. Under its power to form corporations, the Emergency Fleet Corporation was formed. By building and purchase, 2543 vessels of 14,706,217 dead weight tons were acquired. Of these, 2314 vessels of 13,636,967 tons were built; 103 of 368,305 tons were purchased; 105 of 675,441 tons were seized enemy vessels; and the remainder were transferred from other government departments. To effect construction of the new ships, contracts were made for the building and extension of shipyards, as well as for actual construction. After the close of the War, vessels in hand were completed, the latest in 1921.

In the meantime, great efforts were made to put the new ships to use. The Merchant Marine Act of 1920 directed the board to investigate

and determine what steamship lines should be established for the general benefit of American trade. And the board was authorized to sell or charter such vessels as might be suitable to American citizens or companies who agreed to establish and maintain such lines; if no citizens or companies would make the purchases, charters, or contracts for the desired services, the board was authorized to establish the services under its own direction and maintain them until a favorable sale could be made or their financial inadvisability determined. The act also provided for a fund of \$125,000,000 to be lent to American citizens or companies to assist in the construction of the best and most efficient type of vessels for use on desired lines. Steamship lines were subsequently established in all practicable directions; vessels were sold or leased to existing lines, and to lines newly formed, at favorable prices with contracts that insured maintenance of the service for a term of years. Later, established lines were sold or leased under similar contracts.

The situation was much improved by the terms of the Merchant Marine Act of 1928, but the full results have not had time to develop. This act raised the loan funds to \$250,000,000 and provided for mail contracts on such routes as may be selected by the Postmaster General. The rates are Class 1, vessels capable of maintaining a sea speed of 24 knots in ordinary weather and of a gross registered tonnage of not less than 20,000, payment \$12 per nautical mile; Class 2, 20 knots, 16,000 tons, \$10; Class 3, 18 knots, 12,000 tons, \$8, Class 4, 16 knots, 10,000 tons, \$6; Class 5, 13 knots, 8000 tons, \$4; Class 6, 10 knots, 4000 tons, \$2.50; Class 7, 10 knots, 2500 tons, \$1.50.

Another important section of the Act of 1928 provides for the replacement of old vessels controlled by the board and the building of additional passenger, cargo and passenger, and cargo ships of up-to-date type in sufficient numbers to give the United States an adequate merchant marine; and the board is authorized and directed

to present to Congress, from time to time, recommendations as to what new vessels are required for permanent operation under the United States flag and the cost thereof, so that Congress may make provision for them.

The Shipping Board as organized in 1929 consists of seven bureaus—traffic, regulation, operations, construction, law, finance, and research. At the head of each bureau is one of the seven commissioners. The operation and maintenance of the fleet is carried on by a subsidiary organization formed for the purpose and known as the Merchant Fleet Corporation. It replaces the Emergency Fleet Corporation. Its affairs are administered by seven trustees who are the seven members of the Shipping Board, its president being the chairman of that board. The immediate administrative direction of its affairs is in the hands of its vice president and general manager See NAVIES OF THE WORLD AND VESSELS, NAVAL.

SHIPMAN, SAMUEL (1883-). An American dramatist, born in New York City, and educated at Columbia University. He has written many popular plays, among the best-known being *East is West*, in collaboration with John B. Hymer, and *Friendly Enemies*, with Aaron Hoffman. Others are *Love and Art*, *A Social Outcast*, *A Spiritual Vulture*, *The Spell*, with Clara Lipman, *It Depends on the Woman*, *Royal Maid*, *Some Warriors*, *Elevating a Husband*, *Children of To-day*, *Flames and Embers*; *Head of the House*, *Sweethearts*, *The Good-for-nothing*, *Exemption*, with Clayton Hamilton, *Cheaper to Marry*; *The Krcutzer Sonata*, with Percival Wilde, and *First is Last*, with John B. Hymer.

SHIPPING. The depressed financial condition of most European countries which followed the War continued for many years and at the beginning of 1929, full recovery had not yet been attained although ocean-going commerce considerably exceeded pre-war figures. The shipping

of the world with Europe has served to absorb all but five millions of the world's tonnage although the latter is sixteen millions greater than in 1914, while each new ton is of much greater efficiency than a ton of those days. The canals of Suez and Panama are wonderfully facilitating the development of trade; in 1927 that through

industry, which severely felt the lack of trade in the years 1919-23, had about reached normal conditions in 1927 and the proportion of idle ships is no longer excessive except in the United States, where the conditions are exceptional and are hereinafter described under the sub-head *United States Shipping*. The amount of new construction everywhere indicates that the vessels laid up are of the older types for which the demand is decreasing. The great increase of American trade with Europe, South America, and the Orient, and the increased trade of all parts

the former had almost doubled since 1912, while traffic through the Panama Canal had increased from zero to 6456 vessels of 37,189,075 gross tons, almost exactly the same as through Suez, while the cargo carried was somewhat greater See PANAMA CANAL; SUEZ CANAL.

In Europe, Great Britain is maintaining her position as the greatest shipowner and ship-builder among the maritime nations of the world. Her shipping interests have always had the wholehearted support of Government and people—especially of the manufacturers, who have realized the importance of shipping as a stimulator and procurer of foreign trade, as well as a carrier of it. In 1917, as soon as the sinking in the unrestricted submarine campaign reached high monthly figures, every possible effort was made to replace the lost ships by new construction and this reached two million tons per annum in 1920. By 1923 the tonnage of 1914 was exceeded by a million tons and proved to be too great for the existing trade. Since that time, the building has been adjusted as closely as possible to the demands. Germany, which lost two-thirds of her tonnage by the War and war settlements, began to build strongly in 1919 and increased her annual construction until she overbuilt her market in 1922-23. With the revival of trade, her full building policy was resumed and by 1928 her merchant tonnage was, among European nations, second only to that of Great Britain. Italy, whose merchant tonnage first exceeded that of

France in 1928, is adding to her margin. The Netherlands, which are building heavily, may pass Norway, which has few vessels under construction; but Norway is a buyer, not a builder, and commonly acquires bargains in completed ships, so that her building programme does not show a definite indication of her future condition.

In the Far East, the Japanese merchant fleet exceeds in tonnage all others except those of Great Britain and the United States. At present rates of construction, however, Germany is likely to crowd her out of third place in less

then, the building has been but little more than enough to replace old tonnage. Denmark, which was an early leader in the development of the motor ship, is still an active competitor in motorship construction—largely for other countries.

V
NUMBER AND GROSS TONNAGE OF MOTOR VESSELS AND OF OIL-BURNING STEAMERS OF MORE THAN 500 TONS IN THE MERCHANT MARINES OF THE WORLD ON JUNE 30 OF THE YEARS

Year	1914-28		Motor ships	
	No.	Tonnage	No.	Tonnage
1914	441	1,527,728	60	194,019
1920	1,731	8,345,913	290	693,334

1928	3,558	18,741,884	1,009	4,572,171

Tankers. On June 30, 1928, of the 1182 steam- or motor-propelled tankers (i.e., vessels carrying oil in bulk) of 6,578,351 gross tons in the merchant marines of the world, Great Britain had 414 of 2,492,301 tons; the United States, 385 of 2,315,889, Norway, 87 of 534,857; and Danzig, Netherlands, France, Germany, Italy, and Japan have 13 to 64 of 113,000 to 216,000 tons.

During and since the War, the very respectable showing of Russia in 1914 has well-nigh disappeared with no great likelihood of early recovery. The Soviet system, in its early form, was a complete bar to shipping prosperity and present conditions are far from favorable. Spain increased her merchant tonnage during and after the war, but since then has not built enough to replace wastage.

MERCHANT SHIPPING

NORTH GERMAN LLOYD TRANSATLANTIC LINER, "BREMEN"

BUILT AT STETTIN, GERMANY, IN 1929

The "Bremen" leaving New York, July 27, 1929, made a record crossing of 4 days, 14 hours, 30 minutes, Ambrose Lightship to Plymouth, 3082 miles, or an average of 27.97 knots.

MERCHANT SHIPPING

PANAMA PACIFIC LINE TURBO-ELECTRIC STEAMSHIP, "PENNSYLVANIA"

previous to the War, had viewed with very mild interest the steadily declining tonnage in the foreign trade and made no serious efforts to check it. Transportation was transportation, no matter by whom performed, and if other merchant ships could perform it cheaper than those under the American flag, so much the better. All forms of assistance were grudged and few given. The idea of "subsidy" was taboo, although it was perfectly well known that building subsidies and generous operating and mail contracts were given by all the principal maritime nations of Europe. Great Britain disclaimed subsidies, but in one or two years at least, the only profit made by one of her largest steamer lines was the money received for mail contracts and for supplementary allowances for touching at additional ports that were located along the regular steamer course but not on the schedule of stopping points.

The Shipping Act of 1920 declared that "it is necessary for the national defense and for the proper growth of its foreign and domestic commerce that the United States shall have a mer-

chant marine of the best equipped and most suitable types of vessels sufficient to carry the greater part of its commerce and serve as a naval or military auxiliary in time of war or national emergency, ultimately to be owned and operated privately by citizens of the United States." It further declared it to be the policy of the United States to do whatever is necessary to develop and encourage the maintenance of such a merchant marine. It turned over to the Shipping Board all the newly built government-owned ships and all merchant ships otherwise acquired by the Government except those specifically assigned to other departments. It then gave the board authority to sell, charter, or lease vessels to private citizens or steamship companies for the establishment or extension of such lines or services as the board should deem desirable and under such terms as would insure the end in view. In

case the board was unable to secure acceptable bids for the establishment of lines which it deemed necessary or desirable, it was authorized to establish and maintain the lines under its own direction and expense, keeping in view eventual sale to private interests. In performing this and other work prescribed by law and this act, the board was directed to keep always in view the purpose and object of the Government as given in the statement of United States policy.

Nov 1,				
1928	1,949	7,266,125	727	3,915,206

On July 1, 1921, 893 wooden ships of 1,045,424 tons were operated by private owners; on Nov. 1, 1928, they had 557 wooden ships of 686,916 tons, having scrapped, lost, or sold to foreign citizens 336 wooden ships of 358,508 tons, and had built or bought from the Shipping Board or other sources 360 steel ships of 2,711,411 tons of nearly four times the average size of the discarded ones. The improvement in the quality of the tonnage of 1928 is thus apparent. During the years 1921-26, the Shipping Board discarded 279 wooden steamers of 746,487 tons, which were all it had—another gain in quality. Improvement also has been made in other directions in the quality of the merchant vessels. During the

years 1921-28, the number of passenger steamers decreased from 238 to 206, but the total tonnage increased by 224,465 tons (see Table XI). Of the reduction in freight vessels, nearly all of those discarded were wooden vessels or steel vessels of inferior quality. Of the coal-burning steamers, the wooden ones were mostly sold to foreigners or scrapped. Some of the better steel ones were changed to oil burners or fitted with motor machinery. Of the sailing vessels of over 500 tons in Table X, 94 of 160,854 tons are of steel. In the years 1921 to 1928 (both inclusive), the total losses of vessels of over 100 gross tons consisted of 156 vessels of 302,441 tons. These ships were mostly small, averaging 2300 tons. The tonnage loss was 12 per cent of the world's total loss in the same period while the total American tonnage was 21 per cent of the world's total.

XI

NUMBERS AND GROSS TONNAGES OF VESSELS
OF THE VARIOUS TYPES IN THE UNITED
STATES MERCHANT MARINE ON JULY
1, 1921, AND NOV 1, 1928

Type of vessel	July 1, 1921		Nov 1, 1928	
	No.	Tons	No.	Tons
Ships of over 1000 tons

Wooden ships of over 500 tons, private ownership	893	1,045,424	557	686,916
Sailing vessels of over 500 tons, private ownership	..		536	709,115

The outline was thus established. War freight rates and the lack of shipping abroad had built up a large foreign trade in American ships. This reached a maximum in 1920, when 51 per cent of the foreign trade of the United States was carried in American bottoms. Foreign competition and the dropping of freight rates caused a steady decline. Two million tons were transferred to the coasting trade in two years. The ships of foreign nations were suited to their trade routes and their owners were conversant with every feature of the business. There were now too many ships for the slowly reviving trade; many foreign vessels and lines were temporarily run at a loss in the effort to regain their trade. The American ships, due to high wages, and the cost of repairs and other items of maintenance, were more expensive to operate; also, many of them were unsuited to the particular service in which engaged. Again the foreign ships won, but the great efforts of the board slowed down the steady loss to American tonnage until 1927, when a condition indicating some stability was reached; but the American ships were growing older and too few new ships were being built. The board foresaw the inevitable result and urged on Congress the necessity for further aid. The result was the passage of the Shipping Act of 1928 (see SHIPBUILDING, ETC., *Shipping Board*) extending the construction loan fund to

NOTE The vessels in the foreign trade given in this table do not include those of less than 500 gross tons, those in Table VIII include all documented vessels

\$250,000,000 establishing rates for mail contracts, and authorizing the construction by the board of such new ships as might be required for the proper development of the merchant service. It was hoped that the aid given by this act would enable the Shipping Board to give the country an adequate marine. This hope was rendered brighter by a realization of the great work done and doing by the Department of Commerce abroad and at home in stimulating trade with the United States.

In 1929 arrangements of great importance were effected by the Shipping Board or planned by it. The first of these was the sale, in February, 1929, of the six large passenger liners *Leviathan* (59,956 gross tons), *Washington* (23,788), *President Roosevelt* (13,869), *President Harding* (13,869), *America* (21,329), and *Republic* (17,910); and five smaller liners, each of 7430 gross tons—the *American Banker*, *American Farmer*, *American Merchant*, *American Shipper*, and *American Trader*. The sale was made to interests represented by Paul W. Chapman, Chicago banker, for the sum of \$16,082,000. The conditions of the sale include a contract to build two large liners of very high speed to run with the *Leviathan* in the Transatlantic service. These interests also propose to build, in the following 10 years, three liners of about 35,000 and two of 25,000 tons.

The contract for the large liners and the other shipbuilding proposals were predicated upon the receipt of mail contracts and the routes covered. As these mail contracts were held up by the Postmaster General, the execution of the plans was deferred. Similar delays were caused by the Postoffice Department in other routes. As that department desired to refer the law back to Congress for better definition of its provisions, it was thought that there might be a delay of several years before the law was fully carried out. Among the many difficulties to be met by the struggling American marine, this was considered unfortunate and serious, and was thought by many to be wholly unnecessary.

The second project which was developed by the Shipping Board was to make further efforts to sell 253 idle freighters on its hands. These are vessels of 5000 to 10,000 gross tons and include all of the better classes of the board's cargo ships that are not needed for existing services and as reserve ships. Most of them are oil burners. They were to be advertised for sale on more favorable terms than have been offered heretofore, and it is believed that sales will be

effected as rapidly as places can be found for their use. The third board project was the reorganization and consolidation of its remaining freight lines with a view to reducing the costs of operation and rendering the lines more attractive to purchasers. If both the freight projects are carried out, the board will be nearly cleared of vessels and the Government will no longer operate ships in the merchant service. The board will then be concerned with the other duties imposed on it by the shipping acts.

Much information in regard to the shipping of the world is contained in the accompanying tables.

SHIPSTEAD, HENRIK (1881-). A United States Senator from Minnesota, born at Burbank, Kandiyohi Co., Minn. He was educated at the State Normal School at St. Cloud, Minn., and at the dental school of Northwestern University, Chicago. He practiced dentistry at Glenwood, Minn., for several years, acted as mayor of the town one year, and was elected to the State Legislature of Minnesota in 1917. In 1920 he moved to Minneapolis, and was elected to the United States Senate by the Farmer-Labor Party on Nov. 7, 1922, and reelected in 1928.

SHOES. See LEATHER; BOOTS AND SHOES.

SHOOTING. Rifle tournaments and trap shooting have long had their appeal to certain sports lovers and international tests are held frequently in the United States and Europe. In 1928 the most comprehensive tourney of the kind ever held took place in Holland, the Swiss team triumphing, with Sweden second and the United States third. The .22-calibre matches were won by the United States, with Great Britain finishing second. The individual title went to Olle Eriksson of Sweden. A recent development in shooting competition is found in the many intercollegiate and interscholastic tournaments held in the United States. Many of these contests are conducted by wire with satisfactory results.

SHORRIDGE, SAMUEL MORGAN (1861-). A United States Senator. He was born at Mt. Pleasant, Iowa, and had high-school training at San José, Calif. He was admitted to the California bar in 1884 and has since practiced at San Francisco. He became widely known on the Pacific coast as a public speaker. In 1884, 1900, and 1908, he was a Republican presidential elector. He was elected United States Senator from California in 1920 and reelected in 1926. In the Senate, he has been chairman of the committee on privileges and elections and also has had membership in the committees on finance, irrigation and reclamation, naval affairs, and public buildings and grounds. He was chairman of the subcommittee which conducted an inquiry into naval propaganda in September and October, 1929.

SHOTWELL, JAMES THOMSON (1874-). An American historian and university professor (see Vol. XXI). In the World War, Professor Shotwell was chairman of the National Board for Historical Service and a member of the committee engaged in preparations for the Peace Conference. At the conference, he was chief of the Division of History and a member of the International Labor Legislation Commission. He was also American member of the organizing committee of the International Labor Conference in 1919. Since 1924 he has been trustee and director of the Division of Economics and History, Carnegie Endowment for International Peace.

In 1920 he was awarded a gold medal of the National Institute of Social Sciences "as one having a world-wide reputation for faithful and effective work in support of the cause of peace among the nations of the world." In 1923 he was lecturer to the Nobel Institute at Christiania (Oslo), Norway. He has written *Labor Provisions in the Peace Treaty* (1919); *An Introduction to the History of History* (1921); and *War as an Instrument of National Policy and Its Renunciation in the Pact of Paris* (1929).

SHOWERMAN, GRANT (1870-). An American philologist. Born in Wisconsin, he studied at the State University there. He was in Rome as fellow of the Archaeological Institute of the American School of Classical Studies (1898-1900) and on his return to the United States in the latter year became professor of classics at the University of Wisconsin. Since 1923 he has been director of the summer school of the American Academy in Rome. He is the author of *With the Professor* (1910); *The Indian Stream Republic and Luther Parker* (1915); *A Country Chronicle* (1916); *A Country Child* (1917); *Horace and His Influence* (1922); *Eternal Rome* (1924); *Century Readings in Ancient Classical Literature* (1925). He translated Ovid's *Heroides et Amores* for Loeb's Classical Library (1914).

SHULL, A (ARON) FRANKLIN (1881-). An American zoölogist born in Miami County, Ohio, and educated at the University of Michigan and at Columbia. He was assistant in zoology (1905-08) at the University of Michigan; instructor (1911-12), assistant professor (1912-14), associate professor (1914-21), and professor (since 1921) of zoology at the University of Michigan. He did important work on sex determination in rotifers and in insects, and was joint author (with Ruthven and La Rue) of *Principles of Animal Biology* (1920).

SIAM, si-ām'. An independent kingdom of southeast Asia; area 200,149 square miles; population in 1921, 9,221,000, as compared with 8,266,408 in 1910, estimated in 1926-27, 9,939,000. Bangkok, the capital, had 931,171 inhabitants in 1924. Chinese coolie immigration arriving at Bangkok in 1927-28 numbered 140,102; those emigrating numbered 63,765.

Industry and Trade. The life of the population centres, for the most part, in the rice fields. In 1927-28, of the 7,389,000 acres under cultivation, 7,319,000 were given up to rice, the yield being 4,527,872 tons. Cotton, tobacco, maize, and pepper receive limited attention. The economic well-being of the country is dependent on forces beyond its control. Drought often plays havoc with the rice crops, while rice demands from Japan and competition from Indo-China and Burma, for instance, affect either favorably or adversely the Siamese market. Thus, exports of rice (in metric tons) reached 1,193,230 in 1913-14; 281,960 in 1920-21 (because of drought); 1,270,535 in 1921-22; 1,275,198 in 1922-23; and 1,433,000 in 1926-27. Of the mineral resources of tin, tungsten, coal, iron, zinc, manganese, antimony, the first receives the greatest attention. Production of tin was: 1918-19, 8834 tons; 1919-20, 8542; 1920-21, 6201; 1927-28, 10,844. In 1913-14 imports were valued at \$32,593,000 and exports, at \$42,742,000; in 1927-28, \$88,500,000 and \$121,570,000. Trade continues to be carried on largely with Hongkong, Singapore, China, India, the United Kingdom.

Railway building has been considerable; mileage increased from 976 in 1915 to 1701 in 1927. Through service from Bangkok to Penang was inaugurated in 1922, and a similar service to Chiangmai was planned. Wireless stations have been erected at Bangkok and Senggora.

Government and History. There has been no change in the structural form of government and the King remains the absolute ruler. The revenues increased from \$27,527,882 in 1913-14 to \$48,900,600 in 1927-28, expenditures from \$23,391,510 in 1913-14 to \$48,659,300 in 1927-28. The national debt at the end of 1914 stood at \$30,410,960; in March, 1928, it was \$57,754,509. In May, 1928, a new currency, known as the baht, with the same value as the tical, was introduced. In 1929 the baht was valued at \$0.44. Under King Rama VI, progress was continuous, particularly in the fields of sanitation, law, municipal functions, etc. On July 22, 1917, Siam declared war on the Central Powers and sent an ambulance detachment to the western front late in 1918. As an Associated Power, Siam had delegates at the Peace Conference and became a member of the League of Nations. Thus, politically, but as well economically, with the passing of Germany, the British influence became paramount in the country after the War. Rama VI died on Nov. 26, 1925, and was succeeded by his brother Prajadhipok, who has launched a policy of economic and commercial development along thoroughly modern lines.

SIBELIUS, sä-bä'y-us, JEAN JULIUS CHRISTIAN (1865-) A Finnish composer (see Vol. XI). To his major compositions, he added three symphonies (*E flat Major*, *Symphony VI*, and *Symphony VII* in C major), music to the tragedy, *Kaalema* (containing the "Valse Triste"), and numerous other pieces which have added to his great popularity.

SIBERIA. The term Siberia is applied to a vast area in northern Asia roughly one and one-half times the size of the United States and divided into a number of geographic, economic, and administrative units forming part of the Union of Soviet Socialist Republics. Soviet official sources in 1929 estimated the total area at 15,764,504 square kilometers (6,086,681 square miles). The population in that year was approximately 23,700,000. This territory, comprising all of Asiatic Russia except four small provinces and autonomous Socialist Soviet Republics in the extreme southwestern part, is divided administratively as follows:

	Area (sq. km.)	Population
Far Eastern Area	2,846,323	1,805,837
Yakutsk Aut. S. S. R.	3,769,000	236,728
Buriat-Mongol Aut. S. S. R.	419,000	484,363
Siberian Area	4,028,615	8,667,874
Kazak Aut. S. S. R.	2,924,938	6,530,528
Kirghiz Aut. S. S. R.	246,000	997,441
Ural Area (Asiatic section)	1,530,628	5,000,000*
	15,764,504	23,722,771

* Approximate figure.

Although the impression is generally prevalent that the mineral, forest, and fur resources constitute the main wealth of Siberia, it is nevertheless a fact that 90 per cent of the population live in rural districts and the most important productive activities are agriculture and the industries allied with it. The lack of capital has prevented the development of the mineral, forest, and fur resources in the past

and probably will continue to do so for a long time to come. The Trans-Siberian Railway serves as the principal mode of communication for the entire region. It is the longest railway in the world, extending from Sverdlovsk, capital of the Ural Area, to Vladivostok on the eastern coast, a distance of 7186 kilometers (4401 miles).

In 1927 the acreage of crops in Siberia was estimated at 7 per cent above that in pre-war times, and of that acreage wheat occupied over 50 per cent, as against 35 per cent in 1923. Live stock was increasing in numbers, with horses nearly as numerous as before the World War, cattle 20 per cent more numerous, and sheep and goats twice as numerous. The gross value of the industrial output had increased by 100,000,000 gold rubles in two years. The trade turnover was nearing the 1,000,000,000-ruble mark, whereas in 1925, it aggregated only half as much. In its plans for the development of Siberia, the Soviet government was giving first place to the basic industries, such as coal and gold mining and metallurgical work, and second place to the more profitable of other industries, such as woodworking, paper, glass, and pottery making and the production of agricultural implements.

Far Eastern Area. (For the rise and fall of the Far Eastern Republic, see below under *History*). This territory, occupying the eastern coast of Asia from Manchuria northward and including most of the island of Sakhalin, is chiefly important for its untapped resources of minerals, forests, fish, and furs. Although 85 per cent of the area remains unexplored, it produces over 40 per cent of the mining and manufacturing output of Siberia. Over 700 deposits of coal, oil, and precious metals have been located, but of these, less than 50 are being worked. In 1926 there were 250 mining and metallurgical enterprises, employing about 20,000 workers. Woodworking, flour milling, and fisheries are the other chief industries. In 1926 the fish catch was 160,000 metric tons, consisting largely of salmon. See SAKHALIN.

Yakutsk Republic. Hunting and gold mining are the principal occupations in this desolate, sparsely settled land bordering on the west of the Far Eastern Area and stretching from the Amur River to the Arctic Ocean. The principal transportation system is the Lena River and its tributaries, frozen several months every year. A freighter from Vladivostok reached the mouth of the Lena in the Arctic Ocean in 1927, opening up the possibility of the profitable mining of bulkier and less valuable minerals. An airplane line between Irkutsk and Yakutsk, the capital, has been inaugurated.

Buriat-Mongol Republic. A comparatively small territory to the south of the Yakutsk Republic, populated mainly by cattle-breeding nomads. Cattle in the territory increased from 586,200 in 1924 to 801,400 in 1926. In 1928 the Far Eastern Area, the Yakutsk Republic, and the Buriat-Mongol Republic together had 2,743,000 cattle, 1,058,600 horses, and 2,446,800 sheep, about one-half of the latter in the Buriat-Mongol Republic. There are also a few leather and glass factories in the latter region.

Siberian Area. The largest and most developed part of Siberia. It adjoins the Yakutsk Republic on the east, the Ural Area and Kazak Republic on the west and southwest, and extends north and south from the Arctic Ocean

to Mongolia. The principal cities are (population in 1926 in parentheses): Omsk (161,475), Novo-Sibirsk, the capital (120,700), Irkutsk (98,979), Tomsk (92,485), Barnaul (73,798), and Krasnoyarsk (72,162). In 1928 about 2,000,000 acres were under cultivation in the region, or 13 per cent more than in 1913, and in the six months ending Dec 31, 1928, it produced 1,096,000 metric tons of grain, or 17 per cent of the total for the entire country. Cattle increased from 5,974,000 head in 1926 to 6,661,600 in 1928, butter purchases by state and coöperative marketing agencies in the region totaled 35,764 tons in 1928, and it accounted for 15.7 per cent of the country's fur production in 1927. The product of the larger factories and mines is valued at about \$100,000,000 annually, one-fifth of which is credited to mines. It has large and undeveloped coal, iron, and nonferrous metal-ore deposits. Lumbering is in the infant stage, with 138,451,000 hectares suitable for exploitation.

Kazak Republic. This large territory, stretching south and west from the Siberian Area to the Caspian Sea and eastward to Mongolia, has tremendous agricultural potentialities. Its development is expected to be stimulated by the completion of the Turkestan-Siberian Railway now under construction.

Kirghiz Republic. Stock raising is the principal occupation of the semi-nomads inhabiting this comparatively small territory wedged in between the Kazak Republic and western Mongolia.

Ural Area. This area, straddling the Ural mountains and including the remaining Asiatic territory west of the Siberian Area and a small part of European Russia, is similar in its geography and economic development to the Siberian Area. It has great iron-ore reserves, those of the Magnet Mountain alone totaling 225,000,000 metric tons. In 1929 the discovery in the Kuznetsk Basin region of this area of a large deposit of coal rich in volatile matter, from which all kinds of oil products may be recovered, was reported by Soviet officials. The Kuznetsk Basin has other large deposits of high-grade coal, iron, manganese, gold, copper, and other minerals and metals and promises to become a thriving metallurgical centre.

History. Immediately after the Russo-Japanese War of 1904-05, a rapprochement took place between Russia and Japan. In a series of four secret treaties, most of which were not made public until the time of the Washington Conference (1921-1922), the two Powers allocated each other their respective zones of interest in the Far East and agreed on friendly cooperation in Far Eastern affairs. The fourth and last of these treaties, which was first published by authority of Trotsky in 1917, was concluded on July 3, 1916, and provided for what amounted to an alliance between Russia and Japan. It was contemporary with an open agreement by which the two Powers bound themselves to co-operate in the regions which hitherto had been the bone of contention between them. Thus, the former enemies had taken definite steps for the prevention of future conflict over eastern Siberia and for a joint imperialistic policy in China to the prejudice of the interests of all other Powers; but hardly had this policy matured when the Russian Revolution annulled the four secret treaties and provided Japan with a pretext and an opportunity to pursue a course of her own in the Far East.

A new chapter in the history of Siberia opened when the decision was reached in the summer of 1918 for Allied intervention in Siberia. The conclusion of peace between Soviet Russia and the Central Powers closed Russia proper to the Allies and thus there remained to them Vladivostok, the back door, as the only possible entrance to render aid to those Russian elements which were still eager to continue the War. The Allies were also anxious to prevent the large military stores in Vladivostok and along the Siberian Railroad from falling into the hands of the enemy. An additional reason for the despatch of the Expeditionary Force was the desire to aid the Czechoslovak Legion which had been slowly and laboriously fighting its way to the Pacific in order to proceed to France, and which had come in conflict in Siberia with the Bolsheviks and the armed German and Austrian prisoners. These were the reasons advanced by the United States in an official announcement of Aug. 3, 1918, for its participation in the venture. Doubtless imperialist motives, and particularly the desire to crush Bolshevism, actuated more than one of the participants, as well. In the case of Japan, for example, it soon became evident that she aimed at the exclusion of Bolshevism and Russia from the Far East, and at the extension of her own political and economic power to eastern Siberia.

Meanwhile, a rather confused situation had arisen in the interior of Siberia. Early attempts on the part of the Bolsheviks to spread their power to Siberia were only partially successful and were blocked during 1918 by the Czechoslovaks and the anti-Bolshevik organizations of various descriptions which sprang up during the course of the year. The confusion was further increased by the independent action of the Japanese, who landed troops at Vladivostok in the spring of 1918. During the summer, the Allied Expeditionary Force arrived and at the same time the Japanese advanced along the Siberian Railway. Thus, there were active over the vast extent of the Siberian territory an incoherent combination of forces and movements each one of which was, with the exception of the common opposition to the Soviet government, actuated by different motives. At the end of 1918, Admiral Kolchak succeeded in uniting the many counter-revolutionary groups into a rather loose organization which established its headquarters at Omsk in western Siberia.

After the elimination of the moderate Socialists and the liberal elements through a *coup d'état* of Nov. 18, 1918, the Omsk government adopted openly a policy of monarchist reaction. The reactionary and military character and the administrative inefficiency of the Kolchak government and particularly the predatory raids of such ruthless anti-Bolshevik condottieri as the Cossack Attamans, Semenov, Ungeln-Sternberg, and Kalmikoff, who recognized only nominally the authority of Kolchak, served to discredit the entire anti-Bolshevik movement with the mass of the Siberian people. The initial support which the counter-revolutionists received from the native population was further weakened by the fact that they were backed by foreign troops operating on Russian soil and especially by the Japanese, whose selfish aims became more and more evident. The number of Japanese troops in Siberia was temporarily reduced as a result of the protest of the American government on Nov. 2, 1918.

The United States, on the other hand, which was the only foreign government that in a measure held the confidence of the Siberian people, refused to enlarge its action into military support of the west Siberian government, in spite of urgent recommendations of the chief American representatives in Siberia in favor of such procedure. Also the Japanese, who had no interests west of Lake Baikal, refused to make such a move and preferred to tighten their hold on eastern Siberia. The military position of Kolchak became in consequence more and more precarious and was further aggravated by the action of General Semenov, who sat astride the Trans-Siberian Railway at Chita and held up at will Kolchak's supply trains. At the same time, the policy of reaction at Omsk went its course and succeeded in alienating completely the sympathies of the Siberian population. After initial military successes during 1919, the Kolchak All-Russian Movement succumbed to the Bolsheviks at the end of the year, a victim of its own folly and of the indifference of the Allies who ostensibly had moved into Siberia to assist the Russians in the formation of a representative government.

This débâcle was followed in February, 1920, by the withdrawal of the American Expeditionary Force and the abandonment by the United States of a Siberian policy which had been a sterile adventure from the start. The last American troops were withdrawn on Apr. 1, 1920. The Japanese, however, remained and consolidated their powerful position. They issued a statement on Mar. 31, 1920, to the effect that "the presence of the Japanese forces in the Russian Far East does not imply any political designs against Russia and . . . as soon as the political situation in the Russian Far East has become normal to the extent that there will be no danger to Korea and Manchuria, and life and property of all our nationals protected and normal railway communications restored, that then, after the evacuation of the Czechoslovak forces has been completed, our troops will be withdrawn from Siberia as early as possible." This statement was followed in April of the same year by an attack of the Japanese troops on the local Russian forces and by the Japanese occupation of the entire Maritime Province. A weak anti-Bolshevik government led for a time in this region a precarious and ignominious existence as a tool of the Japanese.

After the fall of the All-Russian government, the Bolsheviks, advancing from the line of the Trans-Siberian Railroad, gradually established their authority in the greater part of the country. At Irkutsk, the Western Siberian Revolutionary Committee sprang up, which assumed control and governed under direction from Moscow. Local opposition in eastern Siberia to the committee gave birth to the Far Eastern Republic which gradually took over control in practically the entire region east of Lake Baikal. The Republic was nominally an independent state and recognized as such by Soviet Russia on May 14, 1920, with its capital at Chita. In reality, it maintained close connection with Russia. The Far Eastern Republic was not organized along Soviet lines, but on the basis of radical democracy. While private property was abolished, the constitution of the new state contained a bill of rights and the Legislature was elected by the universal franchise of the people. In short, the fundamental principle of the Soviet doctrine,

namely, the dictatorship of the proletariat, was not applied; but it was obvious from the beginning that the Far Eastern Republic was merely a transitional organization and was created to serve as a "buffer" state between Soviet Russia and Japan. This became very evident from its strongly anti-Japanese policy and from its vigorous action against the counter-revolutionary elements, which were still operating within its territory or on its frontiers. In October, 1920, its forces expelled Semenov from Chita.

In consequence of the successes of the Far Eastern Republic, the Japanese opened negotiations with representatives of this state and the Soviet government during 1920, which resulted in the definition of the frontiers between the territory of the Chita government and the Japanese zone. Meanwhile, new complications arose, because of the Japanese occupation of the northern half of the Island of Sakhalin and of parts of Kamchatka, ostensibly in reprisal for the massacre of 350 Japanese at Nikolaevsk in March, 1920. Then, in the spring of 1921, Japan gave support to an anti-Bolshevik White government in Vladivostok under the Merkulov brothers. This government eventually fell after a short Bolshevik campaign late in 1922, when Japanese troops had been withdrawn.

In the early part of 1921, the Chita government called on Japan to withdraw from the remainder of the Siberian territory and pointed to the Japanese pledges in this respect. When this action produced no results, more vigorous notes were directed to the Japanese government, while at the same time representations were made to the United States in which attention was drawn to the fact that the presence of Japanese troops in Siberia was a direct result of the invitation on the part of the United States to the Japanese government for intervention in Siberia and the claim was advanced that therefore the American government was morally responsible for the existing situation. This protest came simultaneously with a strong note from the Washington government to Japan. The United States had grown apprehensive as to the intentions of the Japanese in Siberia and gave warning that Japan's policy might lead to her isolation in Far Eastern affairs. Japan, however, evaded a direct settlement of the issue by inviting the Far Eastern Republic to a conference. Negotiations were begun in September, 1921, at the conference of Dairen, which dragged out till April, 1922, without results.

Meanwhile, the Far Eastern Republic was unofficially represented at the Conference of Washington. There, the Siberian question came up, but was shelved after lengthy discussions. This conference, however, had the indirect result of convincing the Japanese that a policy of closer adherence to international coöperation would be more productive than a policy dictated by national egotism. This consideration, together with reasons of domestic policy, induced the Japanese government, in the summer of 1922, following a proposal of the Far Eastern Republic for renewed negotiations, to express its willingness to evacuate the Siberian mainland by the end of October of the same year. A new conference took place in September, 1922, at Changchun in Manchuria, at which Soviet Russia was officially represented through Joffe, her envoy to China.

After some minor agreements, the conference broke up because Japan was as yet unwilling to

deal directly with the Soviets. In conformity with its pledge, the Tokyo government withdrew its troops from the mainland in October. Finally, under the terms of a treaty negotiated with Russia on Jan. 20, 1925, Japan withdrew her troops from Sakhalin early in that year. This treaty also granted Japan some concessions in the area she was evacuating.

From the very start, the connection between the Far Eastern Republic and the Soviet government had been close and this intimate relationship grew in proportion to the consolidation of the position of the Chita government, to the freeing of Siberian soil from foreign troops and from counter-revolutionists, and to the crystallization of a Soviet Far Eastern policy, especially with regard to China. In December, 1920, a treaty had been signed between the Far Eastern Republic and Soviet Russia whereby Kamchatka was ceded to Moscow. At the same time, communism came more and more to the fore in the inner political life of the Far Eastern Republic and tended to submerge the original democratic principles. The Communists gradually obtained a majority in the National Assembly at Chita and the Far Eastern Republic became for all practical purposes a part of the great Soviet organization. With the evacuation of the Maritime Province by Japan, all of the former Asiatic domains of the Czar were in the hands of revolutionary Russia. The Far Eastern Republic, having fulfilled its purpose, was liquidated on Nov. 13, 1922, when the Chita National Assembly voted to turn over all power to a revolutionary committee which operated as part of the Government of the Russian Socialist Federated Soviet Republics. The undisputed authority of the Moscow government now stretched, in the vast, thinly populated, and undeveloped territory of Siberia, from the Ural Mountains to the Pacific Ocean. The history of Siberia became thereafter wholly part of the history of Soviet Russia. See RUSSIA.

SICARD, sè'kar', FRANÇOIS LÉON (1862-). A French sculptor and member of the Académie des Beaux-Arts, who was born at Tours and studied under Cavalier and Barrias. He won first prize at the Rome exhibition in 1891 and in 1905 was awarded the medal of honor for his statue of George Sand. His works include "The Good Samaritan"; "Agar" and "Edipo" in the Luxembourg Museum; statues of Cardinal Meignan and Joan of Arc, and the figures for the municipal building at Tours.

SIDIS, BORIS. See PSYCHOLOGY, ABNORMAL.

SIEGFRIED, ANDRÉ (1875-). A French writer and professor at the École des Sciences Politiques, who was born in Havre and educated at the Lycée Condorcet, the Faculties of Letters and Law, and the École des Sciences Politiques. In August, 1929, he was a speaker at the Williamstown Institute of Politics in the United States. He was best known in America for *America Comes of Age* (*Les États-Unis d'aujourd'hui*, 1927), a study of present-day civilization in the United States, which, as well as *La Démocratie en Nouvelle-Zélande* (1904, trans. 1914) and *Tableau politique de la France de l'Ouest sous la 11^e République* (1913), received literary prizes. Other works were *Le Canada* (1906); *Deux mois en Amérique du Nord à la veille de la guerre* (1916); a translation of G. F. Campbell's *De Verdun aux Vosges* (1916); and *L'Angleterre d'aujourd'hui* (*Post-war Britain*, 1924).

SIERRA LEONE, sé-ër'rá lé-ò-né. A British colony and protectorate on the west coast of Africa between French Guinea and Liberia. Area of colony, about 4000 square miles; population in 1921, 85,163, of whom 1161 were Europeans. In 1911 the population was 75,572, of whom 702 were Europeans. Freetown, the chief city, had 44,142 inhabitants in 1921, as compared with 34,090 in 1911. The protectorate has an area of 27,000 square miles and a population (1921) of 1,456,148. The colony and protectorate continue to depend upon the export of palm kernels and cola nuts, which form 87 per cent of the domestic exports. Other exports are palm oil, piassava, and rice. Exports in 1913 totaled £1,731,252; in 1920, £2,949,380; in 1927, £1,767,259. Imports, consisting of manufactured goods, food, drink, tobacco, and coal, totaled £1,750,303 in 1913; in 1920, £3,548,478; in 1927, £2,112,024. The important place that Germany occupied in the colony's export trade—it took most of the palm kernels—was taken by the United Kingdom and the United States. The tonnage of vessels entered and cleared in 1927 was 4,058,059 tons. Revenues for 1913 and 1927 were £618,383 and £719,637; expenditures for the same years were £622,439 and £754,610. The public debt on Dec. 31, 1927, amounted to £1,729,848. After 1912 the railway from Boia Junction was extended to Kamabai (104 miles). The natives gave excellent assistance to Great Britain during the World War and aided in the reduction of Kamerun. Their dependence for foodstuffs completely upon importations led to want after the War because of prevailing high prices.

SILESIA, sí-l'esh'-a or -shà, UPPER. This region was the seat of a bitter conflict in the years 1919-21, resulting in the transfer to Poland of the southern and eastern districts (see below). This left German Upper Silesia with an area of 3746 square miles and a population (in 1925) of 1,379,278. The population is mixed. According to the German census of 1910, there were 1,258,186 inhabitants of Polish extraction and 884,045 Germans in German Upper Silesia as constituted before the World War.

Because of this preponderance of the Polish nationals, the Poles, championed by the French, strongly pressed before the Peace Conference their claims for annexation of the whole region. There was an economic factor, however, not to be disregarded. The region was responsible for one-fifth of Germany's total coal production. The vast coal basin, stretching from Oppeln south and east into Teschen and Galicia, by 1913 had produced 45,000,000 tons of coal. Besides, great iron fields, as well as zinc and lead deposits, contributed to make the section one of the most important industrial centres of central Europe. By the decision of the Peace Conference, the region was constituted a plebiscite area and the Inter-Allied Commission was provided for and granted police powers. From February, 1920, until the final disposition of the region (October, 1921), the whole of Upper Silesia was in a ferment. By the French and the Poles, Germans were accused of colonizing the area; the Allied Commission, on the other hand, was charged by Germans with showing partiality toward the Poles and permitting them to intimidate inhabitants in the southern and eastern districts. On Mar. 20, 1921, the plebiscite was taken. The count showed 717,122 votes for Germany and 483,514 for Poland. In the chief

industrial centres, the vote was preponderantly German. As the division of the territory came up for consideration before the Inter-Allied Commission, the disorders increased. Not until Allied troops were despatched in June, 1921, did some semblance of order appear.

The impasse caused by the irreconcilability of the rival demands finally prompted the Supreme Council to turn over adjudication to the League of Nations, August 12. A commission made up of representatives of Japan, Brazil, China, Spain, and Belgium, reported on October 20. The report, as accepted by the League Council, virtually conceded all of Poland's claims. The southern and eastern districts, constituting an area of 1241 square miles, with a population of 892,537, were turned over to Poland. The new boundary, running from Oderberg in the south along the Oder River northwest to a point a little below Ratibor, thence northeast to Beuthen, thence northwest to a point west of Lublinitz, and finally northeast again to Lissau, gave to Poland the greater share of the so-called Industrial Triangle containing four-fifths of the coal production and nearly all the metallurgical plants, viz., half of the county of Zabrze, all of the county of Kattowitz, and a little more than half of the counties of Beuthen and Königshutte. Something of the nature of the division may be seen in the fact that of the 67 collieries in operation in Upper Silesia, 47 were allocated to Poland. These mines, in 1920, had produced 31,750,000 metric tons, of which the 47 mines falling to Poland were credited with a production of 23,763,740 metric tons. In the territory allotted to Poland, 510,000 votes had been cast in the plebiscite, of which 285,000 had been for Poland and 222,000 for Germany. As a rule, German votes had been in a majority in the cities. Because the industrial life of the whole region would be dislocated if boundary lines were drawn immediately, the League Council provided a body of administrative regulations. All of Upper Silesia, for 15 years, was to be under the supervision of a mixed commission of Poles and Germans. Railways were to continue in operation under their old concessions and rates were to be uniform. The existing systems of water supply were to be continued. Though the German and Polish customs laws were to apply forthwith at the new frontier, natural products coming from one of the two zones and destined for consumption in the other were to cross the frontier duty-free. The same was to be true for unfinished products needing completion. For 15 years, Poland was to permit exportation into Germany of any of the mineral products in the Polish zone, and Germany was to reciprocate. Property rights were to be respected as well as the rights of minorities. On Oct. 27, 1921, the German government informed the Council of Ambassadors of its willingness to accept the League's decision, though it protested against what it termed the unfairness of the division of territory. During June and July, 1922, the Inter-Allied forces evacuated the region, and were replaced by Poles and Germans. The Germans proceeded in September, in their zone, to hold an election on the question of home rule as against continuance as a province in the Prussian state. By a vote of almost 10 to 1, the decision favored the erection of a self-governing state. The Poles, on their part, divided Polish Upper Silesia, together with Teschen, into three electoral districts for elections to the Polish Parliament.

See POLAND, under *History*; CZECHOSLOVAKIA.

SILK. The United States is the largest and most important silk-consuming and silk-manufacturing country in the world, notwithstanding the fact that it is dependent entirely upon foreign countries for raw materials, taking approximately three-quarters of the world's production, or more than all other countries combined. Raw silk is also the leading import of the United States. As Japan is the leading producer of raw silk (see Table I), it is natural that the greater part of the United States' silk imports come from that country, with China and Italy ranking second and third, respectively. In 1928 the raw silk imported into the United States amounted to 88,269,000 pounds, valued at \$373,331,000. The countries from which it was imported were as follows:

	Pounds	\$
France	40,081	243,403
Italy	792,231	3,599,571
China and Hongkong	10,527,407	45,948,660
Japan	61,111,650	318,123,930
Other countries	17,946	81,680

The total imports of silk and manufactured silk during the year 1928 were valued at \$414,628,396. That most of this material is consumed in the United States is indicated by the fact that in 1928 the total manufactures of silk exported were valued at \$18,647,749.

The condition of the silk-manufactures industry in the United States in recent years is shown by the accompanying statistics from the U. S. Bureau of the Census.

The world's production of raw silk including tussah silk for the crop years from 1913-14 to 1922-23 is given below. The years 1923-29 are given in Table I.

WORLD'S RAW SILK PRODUCTION BY CROP YEARS			
(In pounds)			
1913-14	59,972,000	1918-19	56,307,000
1914-15	48,468,000	1919-20	61,040,000
1915-16	53,090,000	1920-21	46,500,500
1916-17	59,800,000	1921-22	64,638,000
1917-18	59,007,000	1922-23	69,857,000

Raw silk not only is Japan's leading export but is the most important item in commerce between that country and the United States, naturally affecting to a marked degree relations between the two nations. An American technical committee visited Japan in 1928 and was in conference with representatives of Japanese silk organizations and firms regarding raw-silk classification. At these conferences, an analysis was made of the problems confronting the industry and plans were inaugurated for an international technical raw-silk conference to be held in the United States, in which raw-silk-producing and -consuming countries were to participate. A study was to be made of raw silk in relation to the requirements of silk manufacturers so that mutual benefits and further and more complete standardizations would result. Table III (on page 1457), from the Silk Association of America gives Japanese production and exports for the ten calendar years 1919-28.

As showing the importance of raw silk in international commerce, there was established on Sept. 11, 1928, a national Raw-Silk Exchange in New York which straightway functioned satisfactorily and apparently filled a distinct need. This exchange was able to create a recognized price basis and formed a connecting link between the supply market in Japan and the consumer in

TABLE I—WORLD RAW SILK PRODUCTION, INCLUDING TUSSAH SILK

[Compiled by the Statistical Bureau of the Silk Association of America]

Grand total, pounds	105,577,000	101,567,000	97,311,000	88,052,000	85,860,000	67,200,000

^a Estimated^b The total production of raw silk in Asia is an unknown quantity, therefore expert figures have been used.^c Excludes tussah silk

The domestic consumption of raw silk (including tussah) in China is estimated to be 52 per cent of the production. The exports from Canton and Shanghai during the season 1928-29 were 19,400,000 would indicate a crop of approximately 41,000,000 pounds. The Japan crop was estimated at 87,500,000

TABLE II—SILK INDUSTRY

the United States. A grading and warehousing committee, as well as an inspection bureau, was established and arrangements were made for a definite basis for the various transactions. Future contracts formed an important feature of the business of the silk exchange and it was believed that the industry would be stabilized through the facilities thus provided. Transac-

The necessity for such attempts at stabilizing is most apparent when it is realized that few commodities fluctuate more from year to year than raw silk, and an accompanying table indicates the average price per pound at New York over a number of years. Often there is a considerable fluctuation in a single year, as for example in 1928, when the monthly average for Japanese double extra cranks ranged from \$4.83 per pound in July to \$5.38 in April, or in 1926, when from an average of \$6.76 the price fell to \$5.63 in December. Yearly averages are given in Table IV

^a Fiscal years to 1915, inclusive, calendar years thereafter^b Figures represent raw silk only, quantity for other unmanufactured silk not having been reported.

The accompanying tables are of interest as showing the development of the American silk industry in recent years as revealed by imports of unmanufactured silk and the production of fabrics and other manufactures in census years. This is shown further in the data collected by the U. S. Department of Commerce at the biennial census of manufactures taken in 1928, when the establishments engaged primarily in the manufacture of silk products, not including knit goods made of silk, reported, for 1927, a total output valued at \$750,123,705, a decrease of 7.3 per cent, as compared with \$808,979,399 report for 1925, the last preceding census year. The total for 1927 was made up as follows: All-silk broad silks, 385,530,447 square yards, valued at \$376,919,357; silk-mixed broad silks, 127,296,292 square yards, \$108,696,047; velvets, 5,484,095 square yards, \$11,909,215; plushes, 1,309,694 square yards, \$2,747,745; upholsteries and tapestries, 3,705,240 square yards, \$8,302,979; thrown silk, for sale, 11,408,721 pounds, \$70,247,417; spun silk, for sale, 4,455,990 pounds, \$15,696,165; ribbons, \$36,040,945; miscellaneous products, \$70,998,258; receipts for contract work, \$48,565,577. In addition, silk products were manufactured to some extent by establishments engaged primarily in other lines of manufacture. The value of such commodities thus made as secondary products outside the industry amounted to \$7,131,055 in 1927 and \$4,729,234 in 1925.

The American silk industry embraces two classes of establishments (1) Those engaged primarily in the manufacture of finished silk products, not including knit fabrics, hosiery, and other knit goods made of silk; (2) those engaged primarily in the manufacture of silk yarn, known technically as organzine, tram, hard or crêpe twist, and spun silk, and in the manufacture of warps. The greater part of the work performed in the second class of establishments is done, on a contract basis, on materials owned by others.

Of the 1648 establishments reporting for 1927, 819 were located in New Jersey, 490 in Pennsylvania, 181 in New York, 35 in Connecticut, 33 in Massachusetts, 31 in Rhode Island, 14 in Virginia, 7 in Maryland, and the remaining 38 in 15 other States. Paterson, N. J., with an output in 1927 valued at \$106,000,000, is the largest centre of the industry. In 1925 the industry was represented by 1659 establishments, the decrease to 1648 in 1927 being the net result of a loss of 340 and a gain of 329. Of the establishments lost, 255 went out of business prior to 1927, 39 were idle throughout the year, 26 reported commodities other than silk as their principal products in 1927 and were therefore transferred to the appropriate industries, and 20 reported products valued at less than \$5000. (No data are tabulated at the biennial censuses for establishments with products under \$5000 in value.) Of

^a Quantity for 1914 given in linear yards^b In addition, 772,881 square yards, valued at \$1,872,500, of silk and silk-mixed plushes were reported by establishments engaged primarily in the cotton-goods and woolen-goods industries.^c No comparable data. Included in "All other products."

the establishments gained, 16 had manufactured other classes of commodities as their principal products in 1925 and 313 reported for the first time at the 1927 census.

The United States not only imports manufactured silk, but has a considerable export of silk manufactures. Manufactures of hosiery by 1928 were reported to the amount of 899,824 dozen pairs valued at \$9,657,763, the Philippine Islands, British South Africa, Cuba, and South America being important customers.

* Fiscal years, 1871 to 1915 inclusive, calendar years thereafter.

* Imports of rayon are included in the total of silk manufactures prior to 1911. Rayon was first shown separately in the imports entered for consumption in 1907. The values of rayon imports for consumption from 1907 to 1910, inclusive, were as follows: 1907, \$908,099; 1908, \$1,360,291; 1909, \$1,427,909; 1910, \$2,062,357.

* Broad silks only, classed as dress goods in exports prior to 1922. Pile fabrics are not included in the imports of silk fabrics for any year nor in exports after 1921.

SILVER. The production of silver in the United States was greatly increased during the period from 1920 to 1923, because of the passage of the Pittman Act (Apr. 23, 1918) which provided for the purchase by the United States Treasury for coinage purposes of a certain volume of silver at the fixed price of \$1 per ounce. Recently, American silver producers have claimed that this act was never completely carried out and they have taken their case to the courts in an attempt to force the United States Treasury to complete its purchase of silver under the terms of the Pittman Act.

Approximately 85 per cent of the world's silver production is from the American continents. Mexico is the leading producer, followed by the United States and Canada. Utah is the leading silver producer in the United States, followed by Montana, Idaho, Arizona, Nevada, and Colorado in the order named. A large proportion of the domestic silver production is from the silver-lead and silver-lead-zinc ores

of Utah and Idaho, as well as from the copper ores of Utah, Montana, and Arizona.

Featuring the silver market in recent years has been the demonetization and debasement of silver coinage in a number of European countries such as France, Belgium, and Great Britain. Thus, a large supply of secondary silver

serve Bank Bill in 1926 was a bearish influence on the silver market, as the Bill provided for the sale of part of the Indian government's large silver reserves on the open market. In 1928 the Indian government announced, however, that action on the sale of its silver reserves had been postponed.

SIMMEL, GEORG (1858-1918). A German philosopher and historian (see Vol. XXI). One of the clearest and internationally most respected thinkers before the World War, Simmel took to heart the European catastrophe. He sought refuge in the philosophy of art and composed an appreciation of *Rembrandt* (1917). Shortly before his death, he wrote his philosophic testament, published under the title, *Lebensanschauung* (1918). He published also *Zur Psychologie der Kriegsneurose* (1918). A number of studies on Simmel and the various phases of his philosophy were published in Germany after his death; among these may be mentioned Max Adler's *Georg Simmels Bedeutung für die Geistesgeschichte* (1919).

SIMMONS, FURNIFOLD McLENDL (1854-). A United States Senator (see Vol. XXI). He was reelected Senator from North Carolina in 1918 and 1924 (receiving a majority of 111,000 in 1924). In the period of Democratic control of the Senate, he was chairman of the committee on finance (1913-19) and coauthor of the Underwood-Simmons Tariff Act. In 1920 he was ranking Democratic member of the finance committee, as well as senior Democratic Senator. He was also a member of the committee on commerce and of the joint committee on internal revenue taxation. He was member for North Carolina of the Democratic National Committee from 1924 to 1928. For many years, he was in control of the Democratic State organization and his refusal to support Alfred E. Smith, the Democratic presidential candidate in 1928, was held responsible for the Hoover victory in that State.

SIMMONS COLLEGE. A nonsectarian technical institution for women at Boston, Mass., founded in 1899. The student enrollment increased from 1083 in 1915 to 1459 in the fall of 1928. During the same time, the faculty was increased from 118 to 130 members, and the library from 22,000 to 44,000 volumes. Productive funds in 1928 totalled \$3,290,296 and the income for the year was \$495,416. Certain changes in the requirements for admission were instituted in 1920; three years instead of two of language were required, "free margin" subjects were accepted with limitations, and no conditions were allowed. President, Henry Lefavour, Ph.D., LL.D.

SIMON, CHARLES EDMUND (1866-1927). An American physician, bacteriologist, and zoologist, born at Baltimore and educated at Johns Hopkins (A.B., 1888) and the University of Maryland (M.D., 1890). In 1897 he opened a private clinical laboratory in Baltimore, the first of its kind, and from 1910 to 1920, was a member of the medical faculty of the University of Maryland, where he taught especially biochemistry and pathology. He was lecturer in zoology at Johns Hopkins University (1920-22) and in filtrable viruses (1922-27), becoming a full professor there in June, 1927. He died in November. His chief publications are *Physiological Chemistry* (1901), *Infection and Immunity* (1911); and *Human Infection Carriers* (1919). He was also managing editor of the *American Journal of Hygiene*.

SIMON, RT. HON. SIR JOHN (ALLSEBROOK) (1873-). A British lawyer and public official who was educated at Fettes College, Edinburgh, and Wadham College, Oxford. He was a fellow of All Souls College, was called to the bar in 1899, and first came into prominence as junior counsel for the British government in the Alaska Boundary Arbitration of 1903. He entered Parliament as a Liberal in 1906, retaining his seat until 1918, became King's Counsel in 1908, a Bencher of the Inner Temple in 1910, was knighted in the same year, made a Knight Commander of the Royal Victorian Order in the next, and a Privy Councillor in 1912. He was Solicitor General (1910-13), Attorney General with a seat in the cabinet (1913-15), and was Secretary of State for Home Affairs (1915-16), resigning because he did not approve of conscription. He served on the French front, however, as a major in the Royal Air Force (1917-18). In 1922 he reentered Parliament. His *Three Speeches on the General Strike* (1926) had an important modifying influence on the Trade Union Congress. He declared the strike illegal and the funds of the participating unions attachable. In 1927 he was appointed chairman of the Parliamentary Statutory Commission on Indian Reforms which was to suggest recommendations for the proposed amendment of the Government of India Act of 1919. See INDIA, under *History*.

SIMONDS, FRANK H (ERBERT) (1878-). An American journalist (see Vol. XXI). In 1914 he became military contributor, and after the World War, foreign editor of *The Review of Reviews* (New York), and was an associate editor of the New York *Tribune* from March, 1915, to December, 1918. After 1918 he contributed to a syndicate of American and European newspapers. He was decorated by the governments of France, Rumania, Poland, Belgium, and Greece. He wrote, *They Shall Not Pass—Verdun* (1916), and a *History of the World War* (5 vols.).

SIMONS, GEORGE ALBERT (1874-). An American clergyman, born at LaPorte, Ind., and educated at Drew Theological Seminary. He entered the ministry of the Methodist Episcopal Church in 1899 and preached in Brooklyn and New York City. In 1907 he became superintendent of the Finland and St. Petersburg Mission Conference and was superintendent of the Russia Mission Conference (1921-24) and the Baltic and Slavic Mission Conference after 1924. He founded three publications, *Methodism in Russia*, *Christiansky Pohoruk*, in Petrograd and the *Baltic and Slavic Bulletin*. During the World War, he was chairman of the Red Cross Committee in Russia. In the winter of 1920, he had charge of the distribution of relief supplies sent by the Methodists to Finland and Russia. He was manager of the Russia Methodist Book Concern. In 1923 he established the M. E. Training Institute for the Baltic States.

SIMPSON TUNNEL. See TUNNELS.

SIMPSON, SUTHERLAND (1863-1926). A Scottish American physician and physiologist, born in the Orkneys, Scotland, and educated at the University of Edinburgh (Sc.B., 1894, M.D., 1901). He was head of the departments of physiology and biochemistry at Cornell University (1908-20) and was the author of many papers on physiological subjects, on the central nervous system, animal heat, and secretions.

SIMS, WILLIAM SOWDEN (1858-). An American naval officer (see VOL. XXI). He was president of the Naval War College in 1917, became a vice admiral in command of United States naval forces operating in European waters in 1917, and an admiral in 1918, was again appointed president of the War College in 1919, and retired in 1922 with the rank of rear admiral. In 1920 in an extensive report to the United States Senate subcommittee, he alleged grave errors in the management of United States naval operations during the World War. He was coauthor with Burton J. Hendrick of *The Victory at Sea* (1920), awarded the Pulitzer Prize for the best book on the history of the United States published that year.

SINCLAIR, sink'lār, HARRY FORD (1876-). American oil producer and refiner, born at Wheeling, W. Va. He was educated at public schools in Kansas, and studied pharmacy at the University of Kansas. After spending some years in the drug business, he turned his attention to oil and became president of the Sinclair Oil and Refining Corporation and the Sinclair Gulf Corporation, which in 1919 were consolidated as the Sinclair Consolidated Oil Corporation, of which he became chairman. During 1923-24, the leasing from the Government of the Teapot Dome oil properties by this corporation led to a congressional investigation and a demand for the annulment of the leases. In 1917 he was appointed a member of the committees on oil, raw materials, minerals, and metals of the National Research Council. In addition to his oil interests, he held office or directorships in various fiduciary corporations in Oklahoma, Texas, and Pittsburgh, Pa. In March, 1927, Sinclair was tried and found guilty of contempt of the U. S. Senate in refusing to testify on the Teapot Dome leases. A prison sentence of three months was imposed, which he served in 1929. In November, 1927, a mistrial was declared in the conspiracy charge related to the Teapot Dome leasing because agents of the defense had approached jurors. In a second trial, Sinclair was acquitted on April 21, 1928, of charges of conspiracy with Fall to defraud the Government.

SINCLAIR, MAY (? -). An English writer of psychological novels and critic (see VOL. XXI). Her later books were written with a greater technical perfection. They included *Tasker Jevons* (1916); *Mary Oliver: a Life* (1919); *Mr. Waddington of Wyck* (1921); *Anne Severn and the Fieldings* (1922); *A Cure for Souls*, thought by many to be her best novel (1924); *Arnold Waterlow: a Life* (1924); *The Rector of Wyck* (1925); *Far End* (1926), and *The Allinghams* (1927). She also published *A Defense of Idealism: Some Questions and Conclusions* (1917); *The New Idealism* (1922); and *The Dark Knight*, a volume of poetry (1924).

SINGAPORE. See STRAITS SETTLEMENTS.

SINGMASTER, ELSIE (MRS. HAROLD LEWIS) (1879-). An American author, born at Schuylkill Haven, Pa., and educated at Radcliffe College. She wrote *When Sarah Saved the Day* (1909), *When Sarah Went to School* (1910); *Gettysburg—Stories of the Red Harvest and the Aftermath* (1913); *Katy Gaurer* (1914); *Emmeline* (1916); *The Long Journey* (1917); *Life of Martin Luther* (1917); *History of Lutheran Missions* (1917); *Basil Everman* (1920); *John Baring's House* (1920);

Ellen Lewis (1921); *Bennett Main* (1922); *The Hidden Road* (1923); *A Boy at Gettysburg* (1924); *Bred in the Bone* (1925); *What Everybody Wanted* (1928). She also contributed short stories to magazines.

SINKIANG, sink'yang'. A Chinese outer territory, consisting of Chinese Turkestan, Kulja, and Kashgaria, thus comprising all Chinese dependencies lying between Mongolia and Tibet. Area, 550,580 square miles; estimated population, 2,500,000. The whole was regarded as a separate province and the capital, Urumchi, or Tihwafu, was the seat of the Chinese civil governor. A more assiduous cultivation of the soil, in which irrigation helped greatly, accounted for an increasing prosperity. Leading products include cereals, fruits, vegetables, wool, cotton, silk, jade, and gold. Principal imports from China proper are tea, silks, and cotton piece goods. Imports from India are cotton piece goods, indigo, leather, paints, silk piece goods, spices, etc. Principal centres for Chinese trade are Urumchi and Kucheng, while the principal centres of British trade are Yarkand, Kashgar, and Khotan. Before the World War, the Russian interest in the country was keen and through political agents and traders from Russian Turkestan, its influence was spreading through the population. This penetration for a time ceased as a result of the revolution, so that in 1928, it was not yet evident whether the Soviet government meant to win over Chinese Turkestan's Turanian population. A trade agreement with Russia was concluded in 1924.

SINN FEIN. See IRELAND, under *History*.

SITWELL, EDITH (1887-). A British poet, sister of Osbert and Sacheverell Sitwell (see below). She was born in Scarborough and educated privately. Her first book, *The Mother and Other Poems*, appeared in 1915, and in the next year, she began her editorship of *Wheels*, an annual anthology of verse (1916-21), which she and her brothers hoped would become a rallying point for the younger, more advanced poets. The Sitwells contended that poetry should not be written in stanzas or lines of predetermined length, and that all subjects which reflect life should be treated. Of the three, Miss Sitwell's poetry was the most musical. In her longer poems, she frequently used traditional forms and was able to make these forms seem distinctly her own. Her poems were *Twentieth Century Harlequinade and Other Poems*, with Osbert Sitwell (1916); *Clowns' Houses: Bucolic Comedies* (1923); *Sleeping Beauty* (1924); *Troy Park* (1925); *Elegy on Dead Fashion* (1926); *Poor Young Things*, with both her brothers (1926); and *Rustic Elegies* (1927). She also wrote an essay on *Poetry and Criticism* (1925).

SITWELL, OSBERT (1892-). A British dramatist and poet, brother of Edith and Sacheverell Sitwell (see above and below). Born in London and educated at St. David's, Reigate, and Eton, he immediately joined the Sherwood Rangers (1911), later transferring to the Grenadier Guards (1912-19). He served in France (1914-16) and then developed blood poisoning, the complications of which made him ill for several years. He wrote in a biting satiric vein, *The Winstonburg Line* (1919), a poem attacking Winston Churchill's plan of campaign in northern Russia. His imagination was less colorful than his brother's or sister's, his most effective work being realistic. He wrote *Twentieth Century Harlequinade and Other*

Poems, with his sister (1916); *Argonaut and Juggernaut* (1919); *Who Killed Cock Robin?* (1921); *Out of the Flame* (1923); *Triple Fugue and Other Stories*, excellent satirical prose (1924); *Discursions on Travel, Art and Life* (1925); *Before the Bombardment*, a novel of pre-war times (1926); *Poor Young Things*, poems by all three Sitwells (1926); *England Reclaimed* (1927); *All at Sea*, with his brother Sacheverell (1927), and *The People's Album of London Statues*, illustrated by Nina Hammett (1928).

SITWELL, SACHEVERELL (1897-). A British writer and poet, brother of Edith and Osbert Sitwell (see above). He was born at Scarborough, attended St. David's, Reigate, Eton, and Balliol College, and received further education in the library of the British Museum. He came under the combined influence of the Caroline, minor Elizabethan, and Chinese poets, and the futurism of Manetti. Perhaps his best piece of writing was *Southern Baroque Art* (1924). He wrote also *The People's Palace* (1918); *Doctor Donne and Gargantua* (1921); *The Hundred and One Harlequins* (1922); *Actor Rehearsing and Other Poems* (1924); *The Thirteenth Caesar* (1924); *All Summer in a Day: An Autobiographical Fantasia* (1926); *Exalt the Eglantine and Other Poems* (1926); *Poor Young Things*, poems of all three Sitwells (1926); *Cyder Feast* (1927); *German Baroque Art* (1927); and *All At Sea*, with his brother (1927).

SIXTUS LETTERS. See WORLD WAR, DIPLOMACY OF THE

SKANDERBEG III, KING OF THE ALBANIANS (1894-), and known also as King Zogu. An orthodox Sunni Moslem, he was born at Burgavet Castle in the mountainous district of Matya, where his family reigned over 13 local tribes. He was educated at the Monastir Officers' Training School, the College of Galata Serail in Constantinople. He learned German from the Austrians, with whom he served as an officer during part of the World War. In the chaos of 1920, he and his sharpshooters were conspicuous in enforcing order. He was a delegate to the Constitutional Assembly, and Minister of the Interior in the Regency (1920). During 1922-24 he was Premier. The Nationalists, opposed to his arbitrary methods, revolted in June, 1924. Zogu fled to Yugoslavia, but returned to Tirana on Dec. 24, 1924, ordered new elections and proclaimed a republic (Jan. 22, 1925). On January 31, the Assembly chose him Premier, commander-in-chief of the army, and President of the Republic for seven years. On Sept. 8, 1928, he was crowned King. He obtained pledges of loyalty from the landowners and leaders of the strongest tribes and was able to maintain order. He signed a treaty of alliance and defense with Italy in November, 1926, accepted from her a loan of 50,000,000 lire, and allowed the formation of an Albanian National Bank, which was backed and controlled by Italians. See ALBANIA, *History*.

SKATING. Skating, long a popular recreation, has become a sport affording keenest competition among both amateurs and professionals. The Scandinavian countries in Europe, Canada, and the United States hold their annual national skating championships, while international tournaments are staged practically every season. Many women pursue this sport with skill and enthusiasm, especially as regards figure skating. The

International Skating Federation controls amateur skating competitions. Rinks of immense size in the larger cities of Europe and the United States have been constructed to accommodate the thousands who follow skating purely as a recreation.

SKINNER, HENRY (1861-1926). An American physician and entomologist, born in Philadelphia and educated at the University of Pennsylvania (B.S., 1881; M.D., 1884). He was at different times State entomologist of Pennsylvania, professor of entomology of the Pennsylvania Horticultural Society, head of the entomological department of the Academy of Natural Sciences, Philadelphia, and president of the American Entomological Society. From 1890 to 1911, he was editor of the *Entomological News*.

SKINNER, OTIS (1858-). An American actor (see Vol. XXI). He has starred in *Master Antonio* (1916-18); *The Honor of the Family* (1918-19); *Pietro* (1919-20); *At the Villa Rose* (1920-21); *Blood and Sand* (1921-22); *Sancho Panza* (1923-25); *Merry Wives of Windsor* (1927-28); *A Hundred Years Old* (1929). He is the author of *Footlights and Spotlights* and *Mad Folk of the Theatre*. In 1928 he received a medal of the American Academy of Arts and Letters for diction on the American stage.

SKINNER, ROBERT P. (1866-). An American diplomat. He was born at Massillon, Ohio, and received his high-school training at Cincinnati. From 1886 to 1897, he was owner and editor of the *Evening Independent* at Massillon. He was then United States Consul at Marseilles (1897-1901), and Consul General at Marseilles, Hamburg, Berlin, and London (1901-24). Becoming a foreign-service officer, he was Consul General at Paris (1924-26), and in 1926 was appointed United States Minister to Greece. He is the author of *Abyssinia of Today* (1906).

SKINS. See LEATHER.

SLADEN, FRED WINCHESTER (1867-). An American army officer, born in Massachusetts, and graduated from the United States Military Academy in 1890. He was on duty in Oregon, Washington, Idaho, and the Philippines, engaged in relief work in San Francisco after the earthquake and fire in 1906, and was in China during 1914 and 1916, and on the Mexican border in 1916-17. He was secretary of the War Department General Staff in 1917 and 1918. He was commander of the 5th Infantry Brigade of the 3d Regular Division in France and Germany in 1918 and 1919 and participated in the Aisne, Château-Thierry, Marne, St. Mihiel, and Meuse-Argonne engagements. He served as superintendent and commandant of the U. S. Military Academy, 1922-26, and in command of the Department of the Philippines at Manila after 1926. He was made a major general in 1924.

SLEEPING SICKNESS. This popular name of the affection known to the medical profession as epidemic encephalitis is unfortunate, because this title is preempted by a chronic affection which is endemic among the African blacks. (The last-named disease is known technically as trypanosomiasis.) Although the acute form of sleeping sickness is by no means new, having flourished in different localities under various names in the past, it was not recognized as a separate morbid entity until about 1916 and, since that period, it has become familiar to medical men throughout the temperate zones. Nothing is known of its intimate nature. It

has a high mortality and is apt to leave its victims badly damaged. It occurred at first in epidemic incidence, but attacked only a relatively small proportion of the community. The severity of its nature is due to the fact that it attacks some of the most important portions of the central nervous system.

Epidemic encephalitis is characterized by a great variety of symptoms and a number of clinical types have been isolated, some of which may appear in abortive form. Hence, diagnosis may be difficult in the individual case, for somnolence may be absent and be replaced by excitement and constant muscular twitching. In some localities, this form may predominate, and may be recognized in a disease which prevailed in Italy some 80 years ago. This persisted for some years and at no time was drowsiness mentioned as a characteristic symptom. This is an additional reason against the use of the term "sleeping sickness."

The term "epidemic" is in turn shown to be unsuitable, for reports from many countries illustrate that any epidemic quality once shown by this affection no longer exists, new cases appearing in a purely sporadic fashion. The acute stage of the disease must be distinguished carefully from the sequels, which, particularly in cases in childhood, include peculiar character alterations. Although the latter may develop in patients originally sound and of healthy stock, they resemble closely those seen in inborn moral degenerates. As a result, our conceptions of degeneracy must undergo a change, for the latter is hardly yet regarded as an acquired condition, although it sometimes follows severe injuries to the head. The interest in encephalitis today is shown by the fact that provision is made in the new Neurological Institute (New York City) for the care of a large number of patients suffering from this disease and presumably its more remote consequences.

SLESVIG. See SCHLESWIG.

SLEVOGT, MAX (1868-). A German painter who was born in Landslut, attended college at Wurzburg, and studied at the Academy of Munich. He is represented in the art museums of Munich, Stuttgart, Hamburg, and Dresden. Among his most famous works are "Feierstunde" ("Hour of Rest") at the Munich Pinakothek and the triptych "Der verlorene Sohn" ("The Prodigal Son"). He is also a portraitist and has attracted attention by his 15 lithographs of the *Ilud*.

SLOAN, JOHN (1871-). An American artist, born at Lock Haven, Pa. He received his art education in evening classes in the Pennsylvania Academy of Fine Arts under the late Thomas P. Anschutz. He was particularly noted for his scenes of city life. His lithographs are humorous and vivid. Mr. Sloan has made many drawings for magazines, and his work as an illustrator included designs for Paul de Kock's novels. For his painting, "The Coffee Line," at the Carnegie Institute, Pittsburgh, Pa., he received honorable mention in 1905. "The Dust Storm" is in the Metropolitan Museum, New York City, and examples of his work are included in the print collection at the New York Public Library. He was an instructor at the Art Students' League in New York City and director of the Society of Independent Artists.

SLOAN, MATTHEW SCOTT (1881-). An American electrical engineer. He was born at Mobile, Ala., and graduated at the Alabama

Polytechnic Institute. For four years (1902-06), he was with the General Electric Company at Schenectady, N. Y. He then went to the Birmingham Railway, Light & Power Co., where he was chief engineer and president (1906-14). After three years as general manager of the New Orleans Railway & Light Co., he held a like position in the New York Edison Company (1917-19), and since 1919 he has been president of the Brooklyn Edison Company, Inc. In 1929 he was elected president of the National Electric Light Association.

SLOSSON, EDWIN EMERY (1865-1929). An American chemist, writer, and lecturer (see, Vol. XXI). He was editor of *The Independent* (1903-21) and director of Science Service (1921-29). His later works include *Six Major Prophets* (1917), *Creative Chemistry* (1919); *Easy Lessons in Einstein* (1920); *The American Spirit in Education* (1921); *Plots and Personalities* (1922); *Chats on Science* (1923); *Sermons of a Chemist* (1925).

SLOVENES. See JUGOSLAVIA, *History*.

SMALL ARMS AND MACHINE GUNS.

If we include under the heading "Small Arms" (see also ORDNANCE), shoulder rifles, pistols, machine guns, ammunition, and accessories, the period after 1914, which of course included the World War, was marked principally by developments in machine guns. Prior to the War, practically all machine guns used the same calibre ammunition as did the shoulder rifles with which the infantry was equipped, and were employed as a means by which a given number of individual soldiers could deliver a greater volume of fire at the enemy than if equipped with shoulder rifles. Under stress of actual combat, machine guns were soon divided into different types especially suited for particular uses. The lighter-weight types were adapted to firing short concentrated bursts of fire and the heavier types were developed for playing the continuous leaden stream of the machine-gun barrage. Special types were developed for mounting in tanks and in airplanes and special mounts were developed for employing machine guns in anti-aircraft work.

The special-type guns necessitated the development of special types of ammunition; for instance, armor-piercing, for use against tanks and armored airplanes, tracer and incendiary ammunition for use against observation balloons and gasoline tanks of airplanes. The need for increased fire power led to the development of larger calibre bullets for which heavier and heavier machine guns became necessary, with the result that the sphere of employment of the machine gun was enormously increased and its range of action multiplied two and one-half to three times.

Shoulder Rifles. In 1905 the United States Army adopted the Springfield rifle, calibre .30, model of 1903, as standard equipment for infantry and cavalry troops. This rifle and the standard ammunition for it have been regarded as eminently satisfactory under battle conditions. The experience of the World War has led to suggestions for modifications of the Springfield rifle in minor particulars, such as providing a large aperture sight to be located on the receiver near the eye, telescopic sights for issue to individual sharpshooters, and possibly a change in the stock to provide a pistol grip.

Unfortunately, due to difficulty of production, it was impossible to manufacture enough Spring-

field rifles to equip completely the United States troops or to provide any for troops of the Allied armies, much as they desired this superior weapon. The greater number of the United States troops were equipped with the modified Enfield rifle of British design chambered for rimless .30-calibre United States ammunition instead of the older type British .303 cartridges with projecting rim which tended to increase the danger of jams. Incidentally, the United States ammunition had a much higher velocity than the British cartridge and was much more effective at all ranges at which rifle fire is employed.

Automatic Rifles. The second type of weapon using standard small-arms ammunition is intended to be a portable arm for front-line troops, capable of being fired from the hip if necessary, and to some extent even while proceeding forward to the attack. Its normal employment, however, is from the ground supported by a light biped at the muzzle, the gunner taking the prone position. For this purpose, the British Army used the Lewis gun, the Germans, the Maxim 08-15, and the French, the Chauchat, the United States troops being armed to a considerable extent with the latter weapon prior to the issue of the standard Browning automatic rifle developed contemporaneously with the entrance of the United States into the world conflict. The Browning was probably the most successful weapon of its type in use at the end of the War, but mature reflection on the relative merits of the type led to a conclusion that it was a misfit, being too light for sustained automatic fire and too heavy to be fired from the shoulder. Later tendencies were toward providing a much heavier barrel in order that it might be fired for a greater length of time without putting it out of action by overheating. Provided in addition with a substantial biped mount, it comes under the classification of machine rifles to which the French Chauchat, the British Lewis, and the German Maxim more nearly belong than to the class of strictly automatic rifles.

Pistols. The Colt automatic pistol, calibre .45, was beyond question the most effective weapon of its kind in use prior to the outbreak of the War and only a few minor improvements in it were found desirable as a result of battle experience. Unfortunately, manufacturing facilities were not available to handle increased demands under new tactical requirements and it was therefore necessary to issue a considerable number of .45-calibre revolvers to United States troops which, even at that, were much better equipped in this respect than the troops of any other nation engaged in the War.

Machine Guns. In 1914 the principal types of machine guns were the Benet-Mercie, the Colt, the Maxim, the Vickers, the Lewis, and the Hotchkiss. In May, 1917, the Browning (heavy) machine gun received its initial test and was at once adopted as standard for the United States Army. The new gun demonstrated its superiority to all other types of machine guns then in use by the armies of the world. Although the maximum range of this gun was found to be less than some types of French, and also German, machine guns, the fault lay in the ammunition used and not in the gun itself. With improved ammunition, this gun, which is recoil-operated and water-cooled, has been found a most effective weapon for delivering a sustained fire of great volume.

Aircraft Machine Guns. The machine gun found a new field of employment in connection with aircraft, two general types of mounting being developed as the result of combat experience in the clouds. For the use of the pilot, two or more guns are rigidly mounted on the airplane structure and fired directly to the front, the bullets being fired between the rapidly revolving blades of the propeller by means of a synchronizing mechanism connecting the motor and the gun. Guns may be mounted also on the airplane wings and fired by mechanical or electrical control. For the use of the observer, one or more free guns are so mounted as to permit firing in any direction. Vickers aircraft machine guns were used to a considerable extent for the pilot and Lewis guns for the observers. Martin aircraft guns were later adopted when Vickers became unavailable, due to great care necessary in the manufacture of ammunition for this gun. Browning machine guns were modified for aircraft use, but were not entirely satisfactory, due to the haste in which they were developed. Several attempts to improve this gun have been made recently, but up to 1929 none has been entirely satisfactory.

Super-Machine Guns. The Browning .30-calibre machine gun was brought out contemporaneously with the entrance of the United States into the world conflict. It proved so successful from its first test that early effort was made to apply its principles to the design of a machine gun to fire .50-calibre ammunition. The first design fired a bullet of 600 grains at a muzzle velocity of 2450 feet per second. About this time, several German anti-tank guns were captured. Inasmuch as the 13-mm. ammunition for these guns fired an 800-grain bullet at a muzzle velocity of 2500 feet per second, a second design of .50-calibre machine gun was brought out firing an 812-grain bullet at a muzzle velocity of 2600 feet per second.

A water-cooled .50-calibre machine gun has been designed for ground use by infantry troops, but it develops so much energy in firing that it is impossible to hold it steady for horizontal fire, using a tripod of such light weight as can be conveniently transported by infantry. An air-cooled type for mounting on aircraft has proved very successful and bids fair to be universally adopted as a synchronized weapon. A water-cooled type has also been developed for anti-aircraft use and the ground type was also found suitable for anti-aircraft use. This gun has a maximum range of approximately 7500 yards. Its armor-piercing bullet will penetrate one-inch armorplate at short ranges, and the tracer bullet will give a brightly illuminated trace for approximately 2200 yards. The gun is similar to the .30-calibre Browning gun, the principle difference being the substitution of the spring and oil buffer to central recoil for the spring type used with the .30-calibre gun.

Anti-Aircraft Machine Guns. At first, it was thought that anti-aircraft machine gunnery involved merely providing a simple mount which would permit all-around traverse and elevation of 85 or 90 degrees. The usual type of mount used by anti-aircraft machine gunners during the War consisted of an adapter head with a pintle at the lower part of the bracket which revolved freely on the head of a tripod. The upper part of the bracket was provided with a U-shaped opening in which the machine gun was mounted, thus making it possible to elevate the

gun about its transverse axis and to traverse it by rotating the entire mount adapter about the pintle. The anti-aircraft machine gun made a place for itself in the equipment of all armies, and considerable effort has been expended in the development of more satisfactory mounts for this type of weapon. In order to increase the volume of fire, it is probable that more than one gun will be mounted on each tripod. A semi-ball mount adapter has been manufactured and tested since the Armistice and future design was tending toward this type.

The effective range of 30-calibre ammunition limits the employment of the ordinary machine gun to attack upon the personnel of aircraft or upon the structure of low-flying unarmored planes. The development of the super-machine gun of .50 calibre bids fair, however, to displace the earlier .30-calibre gun, not only on account of its greater range but because its much larger bullet permits the development of more satisfactory armor-piercing, incendiary, and tracer varieties.

Small-arms Ammunition. The War vastly increased the ranges at which small-arms ammunition was expected to be used effectively. In order to meet insistent demands for greater range, extensive test firings were continually held in all armies and every effort made to improve the shape of the bullet and increase the effectiveness of the powder charge. In general, it has been found desirable to further sharpen the nose of the bullet in order to reduce the effect of air resistance and also to "boat-tail" or taper the base, in order to eliminate or greatly reduce the drag caused by the vacuum at the base. The new contour of the bullet has improved its ballistic qualities and the length of the bullet has been increased in order to add weight. With the increased remaining velocity at any given range, a considerable increase in hitting power has been obtained. Consult McFarland, *Ordnance and Gunnery* (New York, 1929), and current issues of *Army Ordnance* (Washington, D. C.). See **STRATEGY AND TACTICS**.

SMALLPOX AND VACCINATION. Much information has been gained about this affection of late years. The conviction is growing that there are different strains of the disease, one of which is naturally mild and the other severe. Should this dualistic view obtain a permanent foothold, many peculiarities of the disease may be explained. A severe type of disease may, of course, have its virulence modified and appear alternately in mild or severe form; but there may be a mild form which is never severe under any circumstances. This appears to be the case with the alastrim of the West Indies, which is believed to be the same as the mild smallpox of West Africa, from which it was originally derived. The latter has long been regarded as distinct from the severe smallpox of East Africa. The severity of the latter, as of the other virulent strains of the disease in the tropics, makes it difficult to control by vaccination, to which must be added the great difficulty of obtaining fresh virus, and the difficulty in enforcing vaccination decrees in primitive communities.

The alleged failure of vaccination in the Philippines was readily shown to have been due to lax enforcement of the laws, the turning in of bogus returns, and other irregularities. The unvaccinated were the sufferers and the country later was properly revaccinated, with resulting return of immunity. During the World War,

there were numerous striking examples both of immunity of vaccinated troops exposed to virulent disease and the spread of the disease among the unvaccinated.

Paul Test. A new diagnostic test is in force in some localities which will prevent the long quarantine of suspects. This consists in the inoculation with the suspicious matter of the rabbit's cornea, cock's wattles, etc. Smallpox pus provokes a peculiar reaction not obtained with the use of any other substance. This is known as the "Paul test."

Post-vaccinal Encephalitis. Within the past few years and with the possibility that the complication may be traced back to an earlier period, there have been cases of a post-vaccinal manifestation which bears a marked resemblance to epidemic encephalitis, or sleeping sickness, and which has given rise to the belief that the general disturbance set up by vaccination may awaken that disease in an individual who chanced to harbor the offending virus in a quiescent state. With cumulative study, this hypothesis is rendered improbable, for most of the cases have occurred in two countries, Holland and England, and the victims have been limited very largely to children above the age of three—in other words, young children—and those past puberty have been almost immune. Aside from the two countries mentioned, in which jointly over 200 cases have been reported, cases are scattered or absent and so far as known not a single one has been reported in the Western Hemisphere. Critics of vaccination, who would ordinarily have expected health authorities and medical societies to suppress or garble reports of this kind, must have been astonished to note the unanimity with which the profession as a whole has freely aired the subject. The vaccine cannot be accused, for invariably the victims were only a minute fraction of the total vaccinated. The lesson thus far is to vaccinate before the age of 3 and after that of 13.

SMALLWOOD, WILLIAM MARTIN (1873–). An American zoologist born at Warsaw, N. Y., and educated at Syracuse University and at Harvard. He was instructor in biology at Syracuse (1896–98), professor of biology and geology at Allegheny College (1898–1902), and associate professor of zoology (1903–07), and professor of comparative anatomy (after 1907) at Syracuse University. He published papers on the embryology of mollusca, and *A Text Book of Biology* (1913, 2d ed., 1920), *Practical Biology* (1916); *Biology for High Schools* (1920), *Man the Animal* (1921); *The New Biology* (1924).

SMELL. See **TASTE AND SMELL**.

SMIDDY, TIMOTHY A. (1877–). An Irish economist, High Commissioner of the Irish Free State in London (since November, 1928). He was born in Cork, went to college there, pursued his studies in France and Cologne, and later became professor of economics and dean of the faculty of commerce at University College, Cork. He was a member of the Trade Boards of Ireland, economic adviser to the Irish plenipotentiaries who were negotiating the Anglo-Irish Treaty in December, 1921, the Dal Eireann's fiscal agent and envoy to the United States (1922), and chairman of the fiscal committee of the Irish Free State (1923). In October, 1924, he went to the United States as the Irish Free State's first Minister in Washington (1924–28). He wrote articles on educational and economic subjects.

SMILLIE, SMILLIE, ROBERT (1859-). A British Labor leader, born at Belfast, of Scottish parents. At 14 years of age, he went to work in a shipyard at Govan, and two years later went to Lanarkshire where he worked in the mines for 16 years. In 1912 he was elected to the presidency of the Miners' Federation of Great Britain, from which ill health compelled him to resign in 1921. He was president of the Scottish Miners' Federation (1894-1918, after 1921), and was on the General Council of Trade Unions, being chairman in 1924-25. In 1923 he entered Parliament for Morpeth. He wrote *My Life for Labor* (1924).

SMITH, ALFRED EMANUEL (1873-). An American public official, born in New York City. He was educated in the parochial schools of the city and from 1895 to 1903 was clerk in the office of the Commission of Jurors in New York City. He was a member of the Democratic organization, and of the Tammany Society, and served in the New York Assembly from 1903 to 1915. In 1911 he was Democratic leader and, in 1913, Speaker in that body. From 1915 to 1917, he was sheriff of New York County. In the latter year, he was elected president of the Board of Aldermen and in 1918, Governor of New York State. He was defeated for reelection in 1920, but in 1922, 1924, and 1926 was successful, serving four terms in all. Governor "Al" Smith was one of the most conspicuous candidates for the Democratic nomination for the Presidency in 1924. (See UNITED STATES, *History*.) In 1928 he was nominated by the Democratic Convention for President on the first ballot. The election was hotly contested, especially in the South, where Smith's attitude on prohibition figured largely in the campaign. He lost Florida, North Carolina, Texas, and Virginia; but in the popular vote throughout the nation, he had the largest total that any Democratic candidate had received since 1916. In the Electoral College, he received the vote of six Southern States, Massachusetts, and Rhode Island. In 1929 he was awarded the Letare Medal by Notre Dame University for distinguished services as a Roman Catholic layman. Previously, he had received the degree of LL.D. from Columbia and other universities.

SMITH, ALFRED H (OLAND) (1864-1924). An American railway president (see VOL. XXI). During the World War, he was appointed assistant director general of railroads in charge of transportation in trunk-line territory east of Chicago and north of the Ohio and Potomac rivers, and regional director of the Eastern District. On June 1, 1919, he was reappointed president of the New York Central lines.

SMITH, ALLEN JOHN (1863-1926). An American physician, pathologist, and writer on scientific subjects, born at York, Pa., and educated at Pennsylvania College (A.B., 1883), and at the University of Pennsylvania (M.D., 1886). He was professor of pathology at the University of Texas (1891-1903), and at the University of Pennsylvania (1903-10), and professor of comparative pathology and tropical medicine at Pennsylvania (1910-26). He served through the World War in the U. S. Army Medical Department as major and lieutenant colonel. In 1902 he published *Lessons and Laboratory Exercises in Bacteriology*.

SMITH, DAVID STANLEY (1877-). An American composer, born at Toledo, Ohio. While pursuing his regular academic studies at Yale,

he also took the course in composition there under Professor Parker. When he graduated in 1900, his *Commencement Ode* for baritone, male chorus, and orchestra was produced as part of the commencement exercises. From 1901 to 1903, he was in Europe, continuing his studies under Thuille in Munich and Widor in Paris. In 1903 he was appointed instructor in the theory of music at Yale; in 1909, assistant professor; in 1916, full professor; in 1920, dean of the Department of Music, succeeding Prof. Horatio Parker; and in 1925, Battell professor. For many years, he was also organist at various churches in New Haven. In 1917 he became conductor of the Horatio Parker Choir; in 1918, conductor of the Choral Art Club; and in 1919 he succeeded Parker as conductor of the Oratorio Society and the New Haven Symphony Orchestra. His works consist of: two symphonies, a symphonic poem, *Darkness and Dawn*; the overtures, *Joyeuse, Sérénade, and Prince Hal*; *Symphonic Ballad, Allegro giocoso, Commemoration March, L'Allegro, Il Penseroso, Impressions, Poems of Youth, Fête Galante, Epic Poem; Prelude, Chorale and Fugue, and Cathedral Prelude*, for organ and orchestra, the choral works with orchestra, *The Windswept Wheat, The Fallen Star, The Dark, Pan, Rhapsody of St Bernard, and Vision of Isaiah*; 3 string quartets; a quintet; a piano trio; anthems; and part-songs and songs.

SMITH, FREDERICK EDWIN. See BIRKENHEAD, FIRST EARL OF.

SMITH, VERY REV. SIR GEORGE ADAM (1856-). A Scottish theologian (see VOL. XXI). He was moderator of the General Assembly of the United Free Church of Scotland in 1916-17, delivered addresses on the moral aims of the Allies in the United States in 1918, and was Baird lecturer at the University of Glasgow in 1922. In 1916 he was made a fellow of the British Academy. His later publications include *Syria and the Holy Land* (1918); *Deuteronomy* (The Cambridge Bible) (1918); *The Teaching of the Old Testament in Schools* (1923); and *Jeremiah* (1923).

SMITH, GEORGE OTIS (1871-). An American geologist (see VOL. XXI). With the exception of one year, he has been director of the U. S. Geological Survey continuously since 1907. In 1922-23 he was a member of the United States Coal Commission. He has written reports on aerial, economic, petrographic, and physiographic geology, and was editor and coauthor of *Strategy of Minerals* (1919).

SMITH, HERBERT BOOTH (1883-). An American clergyman, born at St. Louis, Mo., and educated at Princeton Theological Seminary. He was ordained to the Presbyterian ministry in 1909 and held pastorates in Rochester, N. Y., Knoxville, Tenn., and at Immanuel Church, Los Angeles, Calif. (from 1916). In the last-named city, he ministered to a congregation of 3000. He wrote *Five Sermons on Democracy* (1918); *The New Earth and Other Sermons* (1920); *Science and Prayer* (1924); *Beyond the Sunset* (1927).

SMITH, HUGH McCORMICK (1865-). An American ichthyologist born at Washington, D. C., and educated at Georgetown University (M.D., 1888). He was assistant in the United States Fish Commission (1886-92), in charge of the division of fisheries (1892-96), in charge of scientific inquiry (1897-1903), Deputy United States Commissioner of Fisheries (1903-13); and Commissioner of Fisheries (1913-22). As deputy commissioner and commissioner of fish-

eries, he directed the activities of the Bureau of Fisheries and published various papers on the commercial fisheries and aquatic resources of the United States. Since 1923 he has been adviser in fisheries and since 1926, director of the Siamese Department of Fisheries at Bangkok.

SMITH, JEREMIAH, JR. (1870-). An American lawyer and adviser on finance. He was born at Dover, N. H., and graduated at Harvard (A.B., 1892; LL.B., 1895). He began the practice of law at Boston in 1896. In the World War, he served with the A.E.F. as captain of the Quartermaster's Department. He was with the American Mission to Negotiate Peace as counsel and adviser to the Treasury Department. He served with distinction as Commissioner General of the League of Nations for Hungary in 1924-26 and in that capacity was instrumental in bringing about the financial reconstruction of Hungary. See HUNGARY, under *History*.

SMITH, JOHN M(ERLIN) POWIS (1866-). An American theologian. He was born in London, came to America, and studied at the University of Chicago. He was graduate student and fellow of the university (1895-99) and literary secretary to President Wm. R. Harper (1899-1906). After 1915, he was professor of Semitic languages and literature. He is the author of *Biblical Ideas of Atonement*, with E. D. Burton and G. B. Smith (1909); *Commentaries on Micah, Zephaniah, Nahum and Malachi* (1911-12); *Commentaries on Amos, Hosea and Micah* (1914); *The Prophet and his Problems* (1914); *A Guide to the Study of the Christian Religion*, with G. B. Smith (1916); *Religion of the Psalms* (1922); *The Moral Life of the Hebrews* (1923); *The Prophets and Their Times* (1925); *The Psalms* (1926), and has collaborated on Harper-Smith's *Hebrew Method and Manual* (1921) and Harper-Smith's *Elements of Hebrew* (1921). He also collaborated with A. R. Gordon, T. J. Meek, and L. Waterman in an American translation of the Old Testament (1927).

SMITH, NORMAN KEMP (1872-). A British philosopher. He studied at St. Andrews University, and in Berlin and Paris, and from 1897 to 1906 lectured at Glasgow University. He was professor of psychology at Princeton in 1906 and McCosh professor of philosophy at the same university in 1914. Since 1919 he has been professor of logic and metaphysics at Edinburgh. He is the author of *Studies in Cartesian Philosophy* (1902); *Commentary to Kant's Critique of Pure Reason* (1918); and *Prolegomena to an Idealist Theory of Knowledge* (1924).

SMITH, THEOBALD (1859-). An American pathologist (see VOL. XXI). Since 1915 Dr. Smith has been director of the Department of Animal Pathology in the Rockefeller Institute for Medical Research. He has been a member of the Institute's board of directors since 1901. His researches have been concerned chiefly with the nature and causation of infectious diseases. In addition to receiving honorary degrees from the universities of Harvard, Chicago, Washington, Yale, Princeton, Breslau, and Budapest, he was honored by membership in numerous foreign medical and public-health societies.

SMITH COLLEGE. A nonsectarian institution for women at Northampton, Mass., founded in 1871. The enrollment of the College increased from 1638 in 1914 to 2103 in the fall of 1928; the faculty from 146 to 227 members; and the library from 50,000 to 155,000 volumes. Largely

through an endowment campaign conducted in 1920, the productive funds of the College were increased from \$1,695,892 to \$5,127,523 in 1928. In 1918 a school of social work was established and in 1921 an experimental school for the training of teachers of retarded children. Entrance examinations for all students were required beginning with the fall of 1919. In 1925 a music building and a gymnasium were opened and three dormitories, to complete a quadrangle, and the Tryon Art Gallery were completed. In that year, 32 members of the Junior Class conducted their studies in France and this innovation has become a regular custom. In 1927, in honor of Dr. Neilson's 10 years service as president, the William Allan Neilson Chair of Research was established by his friends and admirers. In 1928 a revised curriculum was put in operation, requiring proof before the senior year of ability to read ordinary prose in two foreign languages, substituting for required courses the selection of work in each of four main fields of learning, and opening to freshmen, courses in religion, psychology, philosophy, and government. President, William Allan Neilson, Ph.D., LL.D., Litt.D., LL.D.

SMITH-LEVER ACT. See AGRICULTURAL EXTENSION WORK; EDUCATION IN THE UNITED STATES.

SMITHSONIAN INSTITUTION. An institution in Washington, D. C., created in 1846 for the increase and diffusion of knowledge. In addition to its own work, the institution administers the following governmental bureaus: The National Museum, the National Gallery of Art, the Bureau of American Ethnology, the International Exchange Service, the National Zoological Park, the Astrophysical Observatory, and the United States Regional Bureau of the International Catalogue of Scientific Literature. It also administers the Freer Gallery of Art.

Each year the institution assists in, or entirely supports, field researches in various branches of science, often contributing valuable material to the National Museum. One of the most important of the institution's recent investigations has been the study of the relation of solar radiation to weather. From observations made at stations in Washington, California, Chile, and at the observatory of the National Geographical Society at Mt. Brukkaros, Southwest Africa, Dr. Charles G. Abbot, director of the research, and his associates established, in 1927, a cycle of sun radiation at 25½ months, which, by corresponding with the known weather conditions, makes possible long weather forecasts. Another field study carried on by the institution is in the geology and palaeontology of the Canadian Rocky Mountains, directed for over 20 years by Dr. Charles D. Walcott, secretary of the institution until his death in 1927. Besides the technical papers published each year by the institution and the governmental bureaus under its direction, 117 volumes and pamphlets were issued in 1928, and 183,196 copies distributed. Secretary of the institution, Dr. Charles G. Abbot, elected Jan. 10, 1928.

SMOKELESS POWDER. See EXPLOSIVES.

SMOKE SCREEN. See WORLD WAR, *Naval Operations*.

SMOOT, REED (1862-). An American legislator (see VOL. XXI), United States Senator from Utah. He was first elected in 1909 and was reelected in 1914, 1920, and 1926. He was chairman of the finance committee and a member of the public lands and surveys, ap-

propriations, and rules committees in the Senate. He was conceded to be the first authority on finance and governmental expenditures, and had much to do with the preparation of the various tariff bills passed during his time of service.

SMUTS, smŭts, Rt. Hon. JAN CHRISTIAN (1870-). A South African soldier and statesman (see Vol. XXI). As a commander-in-chief of the British forces in German East Africa, he had entirely broken the German power there by the end of 1916. Lloyd George then summoned him to London for the deliberations of the war cabinet, of which he was the only Dominion member. He represented South Africa in the Imperial War Cabinet and at the Paris Peace Conference (1919). In the same year, he became Premier and Minister for Native Affairs of the South African Union, being faced by the Nationalist agitation led by General Hertzog. In 1920 he resigned as Minister of Defence, a post he had held since 1910, and in the general election of that year he failed to obtain a majority for his party in Parliament. Faced with the necessity of a union with another party, he turned to the Unionists, and with their help, his South African Party obtained a good majority in the election of 1921, however, the Labor and Nationalist parties joined forces against him, and in June, 1924, he was succeeded by a Nationalist-Labor coalition with General Hertzog at its head. He wrote *Holism and Evolution* (1926), a philosophical book.

SMYRNA, smĕr'nă. A vilayet, or province, of Turkey, including the city of Smyrna. The population at the census of 1927 was 531,579 for the vilayet and 153,845 for the city. By the Treaty of Sèvres (Aug. 10, 1920), Greek diplomacy, largely the work of Venizelos, achieved a triumph when this important region of Anatolia (Asiatic Turkey) was assigned to Greece, but it was won only to be lost again, and by the definitive Treaty of Lausanne (July 24, 1923), it reverted again to Turkey. The artificial nature of the earlier settlement, the defeat at home of Venizelos (December, 1920), and the triumph of Nationalist Turkey (1921-22), all contributed toward hastening the downfall of Greek power in Asia. Venizelos, in his memorandum of Dec. 31, 1918, to the Peace Conference, had asked for the creation of an autonomous Smyrna, made up of the Turkish vilayets of Aydın and Brusa; this region, he claimed, was inhabited by Greek majorities and was set off topographically from eastern Asia Minor, but earlier Allied commitments, notably those to France and Italy, prevented the erection of such a territory, with the result that the Smyrna region awarded to Greece by the Treaty of Sèvres was indefensible on ethnographic, economic, and geographical grounds.

Practically, the treaty clauses meant that Smyrna was to be under the provisional Greek administration for five years, as a transitional stage, and then to be annexed to Greece. The settlement was attacked, ethnographically, on the following grounds: It did not solve the Greek problem in Anatolia for at least 66 per cent of the Greeks lived outside the zone. Again, it would be impossible to move the other Greeks to this enclave, for they consisted largely of traders and the like, and therefore had fixed economic interests in their places of residence. From the economic point of view, the settlement was a poor one because Smyrna was not essentially a Greek city but a great entrepôt of trade linking the

West with Anatolia, and seating a commercial class that included French, Dutch, and British merchants and capitalists, as well as Greek. As for geography, it was at once recognized that the frontiers, as created, cut across rivers, valleys, and railways, and only in the south followed a natural line of division.

Smyrna, originally, had been promised to Italy by the secret agreement of St. Jean de Maurienne (April, 1917); but the reluctance of the Italian people to countenance a costly imperialistic adventure accounted largely for the failure of the Italian government to push its claim or stand in the way of the Greek aspirations. Therefore, the Greek occupation of Smyrna at the invitation of the "Big Three" proceeded unopposed (May 15, 1919). But not unopposed by Turkey, for the occupation was attended by dramatic results. Spurred on by Greek excesses in the Smyrna zone and their deep-seated hatred of the Greeks, whom they regarded as inferiors, Turks throughout the whole of Anatolia sprang to their nation's defense, and gave support to the newly organized Nationalist government located at Angora. Both sides mobilized for war, until by 1921 there were 200,000 Turks and as many Greeks under arms. The Powers made little effort to interfere except for an attempt at the London Conference of Mar. 11, 1921, to rewrite the Sèvres clauses respecting Smyrna. Military interference was out of the question, and in May, 1921, the Powers declared their neutrality, and as was at once evident, abandoned the Greeks to their fate. The war in Anatolia was waged during 1921-22 with varying fortunes (see GREECE), and suddenly terminated in September, 1922, when the Greeks fleeing to the coast entered the city of Smyrna to make for their ships. The Allies took over the city on September 8, the Turks entered September 11, and on September 14 a fire broke out that almost gutted the city and accounted for the loss of thousands of lives.

The Greeks were out of Anatolia in 1922, and the strength of Turkey as against the impotence of Greece, made the question of Smyrna's disposition now relatively simple. The ultimate character of the settlement was foreshadowed in the Armistice of Mudania (Oct. 10, 1922) between Turkey and Great Britain, France and Italy, which among other things assured Turkey of complete sovereignty over Anatolia. A preliminary step was taken in the Lausanne Agreement (May, 1923) between the Turks and Greeks by which the question of Greek damages in Smyrna was amicably settled on the basis of compensation in Thrace. (See THRACE.) Finally, in the Treaty of Lausanne (July 24, 1923), the Greek loss of Smyrna was confirmed. One of the most brutal, and yet possibly necessary, elements rising out of the Greek defeat was the arrangement made for the exchange of Greek and Turkish populations. But for the aid rendered by the Refugee Commission which was created by the League of Nations Council and headed by Henry Morgenthau of New York, the task might well have been insuperable. See GREECE, under *History*.

SMYTH, ETHEL (MARY) (1858-). A British composer (see Vol. XXI). Until the outbreak of the World War, her works were far more appreciated and more frequently performed in Germany than in her native land. It was only during the War that her works began to gain recognition in England, and she was amply compensated for the public's earlier indifference. In 1922 she was made Dame of the British Empire,

and in the midst of the Schubert Centennial, in 1928, London arranged a splendid celebration in honor of her seventieth birthday. Her latest works include two one-act operas, *Fête Galante* (London, 1923), and *Entente Cordiale* (Bristol, 1926). She published her autobiography in two books, *Impressions that Remained* (2 vols., 1919), and *Streaks of Life* (1922).

SNEDDEN, DAVID (1868-). An American educationalist, born at Havilah, Calif. He was graduated from St. Vincent's College in 1889 and took post-graduate courses at Stanford and Columbia universities. For several years, he served as principal of schools in California, and from 1901 to 1905 was assistant professor of education at Stanford University. In the latter year, he was appointed adjunct professor of education at Columbia, serving until 1909, when he became State Commissioner of Education in Massachusetts. In 1916 he became professor of education in Columbia. Professor Snedden was a member of many learned societies and published, among other works, *Administration of Education for Juvenile Delinquents* (1906), *Educational Administration in the United States* (1908), *Problems of Vocational Education* (1911), *Problems of Secondary Education* (1917), *Vocational Education* (1920), *Sociological Determination of Objectives in Education* (1921), *Educational Sociology* (1922), *What's Wrong with American Education?* (1927). From 1918 to 1920, he was president of the National Society for Vocational Education.

SNOWDEN, SIR HON. PHILIP (1864-). An English public official (see VOL XXI). During the World War, he was a member of the Liquor Control Board, and in 1924 was appointed Chancellor of the Exchequer in Ramsay MacDonald's cabinet. In 1927 he resigned from the Independent Labor Party after 34 years of membership, and six years as chairman (1903-06, 1917-20). He was Chancellor of the Exchequer in the second Labor cabinet formed in June, 1929, and in this capacity headed the British delegation to The Hague reparations conference in August. There he secured, subject to the ratification of interested governments, a considerable increase in annuities allotted to Great Britain under the Young Plan. Besides contributing to reviews, he wrote *Wages and Prices* (1920), *Labor and National Finance* (1920), *Labor and the New World* (1921); and *If Labor Rules* (1923). His wife, ETHEL SNOWDEN, who was nominated by the Government to the Board of Directors of the British Broadcasting Corporation, wrote *Through Bolshevik Russia* (1920) and *A Political Pilgrim in Europe* (1921).

SNOW REMOVAL. See ROADS AND PAVEMENTS.

SNYDER, VIRGIL (1869-). An American mathematician, born at Dixon, Iowa. He studied at Iowa State University, Cornell, and Göttingen (Ph.D., 1894). He returned to Cornell as instructor of mathematics and in 1910 became professor. His original investigations include studies on the geometry of the line and sphere, configurations of ruled surfaces, and birational transformations, the results of which he published. He became editor of the *Bulletin of the American Mathematical Society* in 1903. Besides various scientific papers, he wrote *Differential Calculus*, with James McMahon (1898); *Differential and Integral Calculus* (1902); *Elementary Text-book on the Calculus* (1912);

Analytic Geometry of Space (1913). He also edited *Plane Geometry* (1910) and *Solid Geometry* (1912).

SOAPSTONE. See TAIC AND SOAPSTONE.

SOCCKER. This branch of football has attained its greatest popularity in the British Isles where crowds of 100,000 and more gather to watch the important league and cup matches. Canada and the United States latterly have been taking up this sport with ever-increasing interest, leagues and college and school elevens being organized in large numbers. The players for the professional teams in Canada and the United States are recruited chiefly from English and Scottish players of reputation. This practice has aroused considerable trouble in the soccer world, but steps were being taken to eradicate the resultant evils, such as the promiscuous enlisting of star players under contract. A "soccer war" developed in the United States in 1928, when the American Soccer League broke away from the domination of the United States Football Association.

SOCIAL DEMOCRATIC PARTY. See SOCIALISM, Germany.

SOCIAL INSURANCE. It may be said that the post-war period threw into sharp relief a phase of the modern industrial system that had not appeared so important before 1914 the insecurity of the working population. Before the War, with employment general, as foreign markets were being exploited, only passing attention was given to the status of the laboring class. For superannuation, there was relief in the poor house, for unemployment, disability, etc., one might seek charity. Only after the War did governments—and this is more particularly true of European nations than the United States—begin to concern themselves with the position of the worker in an industrial society. Out of this, there have been evolved the elaborate social-insurance schemes for the purpose of giving security to the proletariat. Social insurance concerns itself with unemployment, disability because of accident and occupational disease, sickness, invalidity, maternity, and old age. For the appearance of these programmes, these reasons may be cited: the fear of revolution in the days immediately following 1918; the wiping out of the rentiers and the funds of charitable organizations as a result of the depreciation of the currencies of central European countries; the influence of the International Labor Office; the breakdown of the laissez-faire principle.

In the United States, the movement has been slower than in Europe. The United States did not suffer the fearful hardships of the War and the danger of revolution was remote. Unemployment was a national problem in 1921-23 and 1928, but serious attention was not paid to general schemes of amelioration. While old-age pensions were being discussed, by 1929 only seven States had legislation on their statute books. Workmen's-compensation acts were more or less general though of unequal value, the same was true of widows' pensions. The high cost of medical service was bringing to the forefront schemes for health insurance. Nevertheless, social insurance was not yet beyond the preliminary stage of discussion. It was agreed, however, that the time would not be long before the United States would have joined England, France, Germany, and Russia in writing elaborate social-insurance codes on its statute books, because the increasing mechanization of industry was bringing in its

train early superannuation, more accidents, smaller employment rolls, etc. See **WORKMEN'S COMPENSATION**; **OLD-AGE PENSIONS**; **MOTHERS' PENSIONS**; **UNEMPLOYMENT**.

Workmen's Compensation. In Europe, advances have been great. Since the War, the following countries have amended their workmen's-compensation codes to include office and agricultural workers: Italy, France, Netherlands, Russia, Portugal, and Luxemburg. France included domestic servants in 1923. More liberal definitions of "injury" have been written, waiting times have been lowered, and maximum benefits have been raised. Occupational diseases were beginning to be considered compensable and in some countries lists of enumerated diseases have been prepared. Other countries to enact such legislation were: Bolivia (1924); Brazil (1919); Bulgaria (1918); China (1923); Ecuador (1921); India (1923); Spain (1922); and Uruguay (1920).

Insurance against Sickness. The idea of protecting the industrial population against illness has spread. Old laws have been broadened to include workers in industry, commerce, and even agriculture. The laws are becoming universal in their application, covering all occupations and all causes of invalidity. Thus, in Great Britain, 86 per cent of the wage-earning population was insured; in Germany, 77 per cent; in Austria, 75 per cent. At the end of 1928, the following 19 countries were insuring workers against illness: Austria, Bulgaria, Czechoslovakia, France, Great Britain, Greece, Estonia, Germany, Hungary, Lithuania, Luxemburg, Norway, Poland, Portugal, Rumania, Russia, Yugoslavia, Chile, and Japan. In addition to the lengthening of the list of countries, there has been an extension of the idea to include not only money benefits but also medical services, greater benefits for wage earners with dependents, and maternity protection. In 14 countries, health insurance covers the wife of the worker in her confinement, giving her not only a money benefit but also the care of a physician or midwife, prenatal attention, postnatal care of child, etc. In every European country but Russia, the health-insurance schemes were based on contributory payments by the workers; in half of the countries, the state also contributed. An important tendency was decentralization of the funds with the state occupying a minor rôle and with the insured persons and the employers becoming more important. The state acted as judge, supervisor, and financial promoter. It is interesting to note how these tendencies depart from the socialistic ideology of the nineteenth century.

Old-age Insurance. In the following countries, there have been enacted invalidity and old-age-pension codes: Argentina (1923); Belgium (1920, 1924); Bulgaria (1924); Greece (1922); Portugal (1919); Russia (1922); Yugoslavia (1922); Chile (1924); Cuba (1923, 1924); Italy (1923); Spain (1919, 1921); and France (1928). Canada (1927) enacted a noncontributory old-age pension law based upon federal contributions being matched by provincial contributions. Norway (1923) and Uruguay (1919) also passed noncontributory laws. The Great Britain law of 1924 was passed to extend old-age benefits on a contributory basis to persons between 65 and 70, at which age pensions were to be granted. It was reported that this law affected 15 million workers. In Canada, British Colum-

bia (1927), Yukon, Saskatchewan, and Manitoba (1928) all complied with the federal law and established noncontributory old-age pensions. See **OLD-AGE PENSIONS** for development in the United States.

Unemployment Insurance. Great Britain, by the Act of 1920, greatly extended her unemployment insurance scheme until it had almost universal application. The following countries have followed this example: Queensland, all workers (1922); Austria, industrial and commercial workers (1920); Germany, all workers (1924); Irish Free State, industrial and commercial workers (1920); Italy, same (1923); Poland, same (1924); and Russia, all workers (1922). In all these cases are to be found the compulsory principle with state participation. Voluntary insurance schemes were introduced in Denmark, France, and Norway before the War. After the War, the following other countries sponsored similar experiments: Belgium, Netherlands, Finland, Spain, Switzerland, and Czechoslovakia. For developments in the United States, see **UNEMPLOYMENT**.

International Labor Office. Undoubtedly, the International Labor Office's rôle in the advance of social-insurance legislation has been great. Between 1919 and 1927, of the 54 draft conventions and recommendations adopted for submission to the member states, 17 were concerned with phases of social insurance. Ratifications, indeed, have been slower, but there can be no doubt that the publicity attendant upon the Labor Office's work sooner or later succeeded in crystallizing public opinion. See **INTERNATIONAL LABOR OFFICE** for further discussion of draft conventions and recommendations.

SOCIALISM. The history of socialism after 1914 did not bring forth any noticeable change in principle. The great struggle in the Socialist ranks in this period was concerned primarily with tactics, for throughout these years the Socialist principle retained its solid Marxian basis. While there was much debate among the three foremost groups, the Communists under Lenin, the orthodox Socialists under Kautsky, and the "revisionists" under Bernstein, none of these groups ever seriously questioned the fundamental Marxian doctrine. In regard to procedure, two distinct camps appeared, the one favoring the attainment of the Socialist aim through the dictatorship of the proletariat, and the other striving for the same end by utilizing the existing political and economic institutions. In addition, socialism came to lean more and more on organized labor and under the influence of syndicalism, adopted industrial unionism and guild socialism, tactics of a more strictly industrial character. The disruption of international socialism, the final reconstitution of the International, and the continual shadow of Russia mark the years from 1914 to 1929.

The Socialist International. Early in 1914, plans had been made to hold an International Congress on Aug. 23, 1914, in Vienna, for the commemoration of the founding of the International Workingmen's Association 50 years before. This congress was never held because, with the outbreak of the World War, international socialism broke up into its component national parts. The general strike against war was not called in spite of all previous plans for such action, and the War swept international socialism away regardless of individual mass meetings and protests against war in various

countries. Most Socialists placed their country's needs ahead of their socialistic principles. Only the Russian, some of the British, and a small minority of the German Socialists remained passive. During 1915, more or less determined efforts were made to reconstruct the disrupted International, and toward this end a conference was held at the instance of the Scandinavian Socialists during January, 1915, in Copenhagen. Only the Scandinavians and the Dutch, 16 delegates in all, attended. In February of the same year, the Socialists of the Allied countries held a conference in London, which, however, concerned itself with victory rather than with peace and criticized the imperialism of all the warring countries only perfunctorily. More important than either of these two was the conference held at Zimmerwald, Switzerland, in September, 1915, at the invitation of the Italian Socialists, at which were present representatives of all the important Socialist parties, exclusive of the British, to whom passports had been refused. This conference emphasized the international solidarity of all Socialists and issued a manifesto condemning the War. Nothing definite, however, was accomplished.

The International Socialist Bureau, which had been removed at the outbreak of the War from Brussels to The Hague and which was now under the direction of the Dutch Socialists, held a conference at its seat July 30-Aug. 2, 1916, which was attended by representatives from Sweden, Denmark, Holland, the United States, and Argentina and at which resolutions were adopted placing the responsibility for the War on the capitalist system. The Socialists of belligerent and neutral countries, who had convened during the previous year at Zimmerwald, met again in August, 1916, at Kienthal, Switzerland. The majority of the 40 delegates at this conference represented the Italian Official Socialist Party, and the Swiss and Russian Socialists. Only two Germans and three Frenchmen attended, and hence the conference accomplished very little.

Renewed efforts at international unity brought about the so-called Peace Conference of Stockholm in June, 1917. The plan initiated with the Russian Workmen's and Soldiers' Council and found response among the German and Austrian Socialists who drew up an elaborate peace programme on the basis of "no annexations and no indemnities." Of all the important Socialist parties, only the Germans attended, and the conference was therefore an utter failure. More concrete results were produced by the Inter-Allied Labor and Socialist Conference of Feb. 21-23, 1917, at London. It voted a declaration of war aims, commonly called the London Memorandum, which endorsed President Wilson's four principles essential to peace and the British Labor Party's programme as to war aims, and advocated the League of Nations. Another Inter-Allied Socialist Congress met in London during September, 1918. Amid continued attempts during 1919 to revive the disrupted Second International, 12 Radical Socialist parties met at the instance of the Russian Soviet government at Moscow, Mar. 2-6, 1919, and formed the Third International, a strictly Communist organization. The International Socialist Bureau, the only remnant left of the Second International, summoned the Berne Conference of February, 1919, at which 26 countries were represented. The conference settled a

number of points of conflict and also expressed its opposition to the Communist International.

At the Congress of Genoa, August, 1920, international socialism was finally reconstituted after six years of discord. The organization was, however, by no means complete, for many Socialist units remained outside its fold. The congress declared emphatically against the acts and programme of Lenin and Soviet Russia and adopted in the main British Labor Party features and principles. A score of Socialist parties attended the conference and affiliated with the new international body. Amsterdam was chosen as the permanent seat. The Third International held a congress at Moscow in 1921, which was attended by several hundred delegates from 42 countries. The result of this meeting was the maintenance of the Soviet doctrine in all its purity. Socialist groups that were opposed both to the nationalist tendencies of the Second International and the exclusive Communist character of the Third International organized in Vienna, Feb. 2, 1921, the International Working Union of Socialist Parties, or, as it was commonly termed, the Second-and-a-Half International. The chief adherents of this body were the Independent Labor Party, the German Independent Socialists, the Socialist Party of France, the Austrian, Swiss, and Rumanian Socialists, and the Russian Mensheviks. This intermediary organization soon manifested a desire, however, to coöperate with the other Internationals, and at its instance, a conference of the three Internationals was held in the Reichstag Building in Berlin, Apr. 2-5, 1922, at which a basis for common procedure was discussed.

While the conference and the subsequent meeting of its Committee of Nine, Berlin, May 23, 1922, ended in a failure, so far as the Moscow International was concerned, it succeeded in bringing the other two organizations closer together. This rapprochement continued during the remainder of the year and at the meeting of the executives of the two bodies at The Hague, Dec. 10, 1922, it was decided to call a congress at Hamburg for May 20 of the following year, in order to bring about united Socialist action. At this congress, 424 delegates from 30 countries, representing 43 Socialist parties or groups, were present. The Vienna International and the Second International merged and formed the Labor and Socialist International with its permanent seat in London. Thus, the Socialist parties of the world, with the exception of the Communist groups, were united for the first time since August, 1914. The new organization and the Third International continued their hostility to each other.

In the following years, however, the Second International did not play a particularly significant rôle, Socialist development being almost exclusively along nationalist lines. In 1925 the Second International met at Marseilles (August), where 600 delegates representing 30 nations assembled. These reported that they stood for seven million party members and 28 million votes. Resolutions passed by the congress favored the 8-hour day, approval of the League of Nations, and undying enmity for the Communists. In 1926 these Socialists plainly showed that their loyalties were nationalist rather than internationalist when the World Migration Congress, called by the International, refused to pass a resolution favoring free migration for working populations. Socialists from

the European countries opposed restriction but had to bow before the wishes of the delegates from Canada, Australia, and New Zealand, who supported their governments in restrictive legislation. This congress met at London in June and was attended by delegates representing 15 million trade-unionists. During the period, it became apparent that the International Labor Office was largely taking the place of the Second International in watching out for the interests of the laboring classes throughout the world.

The United States. The American Socialist Party lost rather than gained during 1914. Although it elected Meyer London to Congress, it polled at the November elections over 200,000 votes less than in 1912. During 1915 there was a great deal of strife in the party over the non-participation of the American Socialists in the Copenhagen Conference. The party was rather successful in that year in electing candidates to State and local offices. At the presidential election of 1916, however, it polled over 150,000 votes less than in 1912. America's entrance into the War in 1917 had the same disrupting effect on the American Socialist Party that the War had had on the Socialist parties of other countries. After endeavoring in vain to have the party repeal its expression of opposition to the War, a patriotic group seceded and formed the Social Democratic League in 1918. During the same year, the American government suppressed many anti-war activities of the Socialists by imprisoning a number of them, including Eugene Debs. New factional disputes arose in 1919 after the Chicago Convention at which the party declared in favor of the Second International. The radical elements left the party and formed the groups subsequently known as the Communist Party and the Communist Labor Party (see COMMUNISM). Thus, the American Socialist Party lost considerable influence due to its middle-course policy. On the one hand, it alienated the more conservative elements; while, on the other hand, it lost those who were Communist in sympathy and wished to stand squarely on the Moscow programme.

In 1920 the American Socialists took a definite stand against Moscow by insisting on using their own judgment as to their principles and tactics. That year was also marked by the suspension of the five Socialists elected to the New York State Assembly. When these were reelected, three of them were again suspended in December of the same year. At the national elections in 1920, the party polled about one million votes. In 1921 the sentences of Debs and a number of other Socialists, imprisoned during the War under the Espionage Act and other war-time measures, were commuted. At the Convention of 1922, the Socialist Party voted for affiliation with the Vienna International and for unreserved recognition of Russia. In Wisconsin, the Socialists sent Victor Berger (died 1929) to Congress in the elections of 1922, while Daniel W. Hoan became mayor of Milwaukee for a third term. In New York City, the Socialist Party joined in the elections with the Farmer-Labor Party to form the American Labor Party. An invitation from the Workers' Party, the successor of the Communist Party, for coöperation in various matters was rejected unanimously at the annual convention, May 19-23, 1923. In the elections of the same year, the Socialist Party in New York City coöperated again with the Farmer-Labor Party.

The events of 1924-28 showed that Socialism in the United States had not yet recovered from its decline. The Socialist National Convention on July 6, 1924, at Cleveland, threw in its lot with the La Follette movement, and by this step set back the progress of socialism for at least a decade. Men like Victor Berger and Morris Hillquit prevailed over the counsels of the group represented by Scott Nearing and endorsed a liberal programme that said nothing of the basic principles of socialism. The defeat of La Follette (see UNITED STATES) proved the futility of hoping for Socialist success without a permanent organization and a definite code of principles. The Socialist Party was unable to repair its political fences during the next four years, with the result that it entered the presidential campaign weaker than ever before. In April, the party placed in nomination Norman Thomas of New York and James H. Maurer of Pennsylvania on a platform calling for public ownership of natural resources and public utilities, governmental relief of unemployment by the extension of public works, outlawry of war, the recognition of Russia, etc. The valiant efforts of Mr. Thomas availed nothing, despite a brilliant campaign, in which he sought to win away the liberals from supporting Smith on the ground that the Democratic candidate was doomed to defeat. Only some 300,000 votes were cast for Thomas, one-third of which came from New York City. The vote was the smallest in the history of the party since 1900. See COMMUNISM.

Great Britain. Early in 1914, the three outstanding British Socialist societies, the British Socialist Party, the Independent Labor Party, and the Fabian Society, drew up a plan for closer coöperation, but here, as elsewhere, Socialist progress was checked by the advent of the War. In England, as in Germany, there was at first organized Socialist protest against the War. This changed, once the conflict had become a reality. The Labor Party, only partially Socialist in character and composition, gave full support to the Government while the Independent Labor Party remained aloof. Thus, on the whole, British socialism and the Labor Party remained loyal to the Government throughout the War (except for a group of British Socialists) and in the closing years of the struggle, Socialist members of the Labor Party accepted posts in Lloyd George's war cabinet. After the War, in 1919, unsuccessful attempts were made to bring together the British Socialist Party, the Independent Labor Party, and the Fabian Society. There had been a fourth group, the former Social Democratic Federation, now called the National Socialist Party, which in 1920 assumed its old name and joined the Labor Party. The latter, still only partially a reflection of Socialist views and principles, became in the post-war period increasingly Socialist in character and its gains in the elections of 1919 were regarded as Socialist gains. In 1920 it expressed itself as opposed to the Third International. At the same time, the Radical British Socialist Party became the British Communist Party (see COMMUNISM) and was joined by the Socialist Labor Party, an offshoot of the American Socialist Labor Party. Toward the end of the War, guild socialism (q.v.) and syndicalism (q.v.), two nonpolitical and strongly industrial movements, began to exert an ever-increasing influence on British socialism, but

toward the end of the period 1924-29, this influence had waned. The elections of 1922 made the Labor Party, with 142 members in the Commons, the chief party of opposition and after the elections of 1923, which increased its strength to 191 seats, the Labor Party took over the government with the passive support of the Liberals.

The Labor government, headed by the very able Ramsay MacDonald, continued in control from Jan. 21 to Nov. 4, 1924, when the general election of that year returned a Conservative government with a powerful majority. The Labor Party became the official Opposition and worked steadfastly with its eye on the general election of 1929. As a result of the failure of the general strike and the disaster that overtook the miners, Communist sentiment for a time was strong and the Labor Party found itself confronted by a strong opposition from within. The wise direction of Mr. MacDonald, together with unemployment, the heavy burden of debt, and the high cost of the armaments programme, all contributed toward the rehabilitation of the party, with the result that the end of 1928 and the early months of 1929 saw Labor candidates winning a number of by-elections from Conservatives. So great were the preliminary successes of the party that it was announced that candidates would be placed in the field in rural districts. In the election manifesto of July, 1928, the party announced that it was its intention to transfer "capitalism into socialism" by peaceful methods. It also was opposed to a reduction in wages, favored the repeal of the Trade Unions Act, was for a 48-hour week, extension of the factory code and the minimum wage, and nationalization of coal, transport, power, life insurance, etc. During the period after the War, the Labor Party acted as the leading spirit of the Second International. As a result of the three-cornered contest, Laborites obtained a plurality of seats and the summer of 1929 saw the second English Socialist government with MacDonald once more as the Premier. See GREAT BRITAIN, under *History*.

Germany. While the War was still imminent, the German Socialists voiced their protest against it in organized mass meetings, but once war was declared, the Social Democratic Party in the Reichstag, with a few exceptions, supported the Government and voted the war credits. As the War progressed, dissatisfaction with the party's attitude toward the Government and the War appeared in the Reichstag group and, although few in numbers during 1914 and 1915, the dissenters were strong enough in 1916 to break with the party and form a new organization, the Socialist Union of Labor, which mustered 20 members in the Reichstag and adopted a programme uncompromisingly opposed to the War. During 1917, the new organization grew in strength and called itself the Independent Social Democratic Party. With the disastrous close of the War, and the revolution, the Majority Socialists took over the government. When the Independent Socialists seemed to be willing to support them, a minority among them, which had been most outspoken in its hostility to the War, seceded and expressed sympathy with the Soviets. The Spartacists, as these ultra-radicals called themselves, began an uprising in January, 1919, which was forcibly suppressed by the Majority Socialist government. As a result of the elections of 1919, the Government passed completely into the hands of

the Majority Socialists, but the Independents also made considerable gains. Of the three Socialist groups which thus existed in Germany, the Majority and Independent Socialists favored the Second International; and the Spartacists, the Third International. At their annual national congress at Gölitz in September, 1921, the Majority Socialists decided to coöperate with the bourgeois parties. In September, 1922, in the Convention of Nuremberg, the Majority Socialists and the Independents combined into the United Social Democratic Party. The Reichstag group of the Communists joined in 1923 the Reichstag group of the United Socialists and formed with some of the former Independents the left wing of that party, but in the Reich, the Socialists lost many members to the Communists. This leftward trend within the Socialist rank and file became clearly apparent in the elections of May, 1924, when the seats of the United Socialists in the Reichstag were reduced from 166 to 100, while the Communists obtained 60 seats against 15 in the old Reichstag.

In the national elections of May 20, 1928, the Social Democrats (Socialists) elected 152 deputies to the Reichstag and polled the largest popular vote in the election. Out of the 30,500,000 votes cast, the Social Democrats received 9,000,000. The Communists elected 52 deputies and received a popular vote of 3,000,000. The Social Democrats had run on a platform which included: loyalty to the Republic, more protection for the workers, separation of Church and State; and the socialization of industry. For the rôle played by the Social Democrats in the politics of the country, see GERMANY, under *History*.

France. The elections of 1914 increased the number of seats of the Socialists in the French Chamber to 101. The outbreak of the War found the French Socialists giving uniform support to their Government. They regarded the War as a war of defense on the part of France and dropped the anti-militarist plank from their platform. During 1915 and the greater part of 1916, they continued this solid indorsement of the Government, but late in 1916, a steadily growing minority element sprang up which opposed the War. At the Socialist Congress of Bordeaux, October, 1917, it became apparent that the majority had swung over to the minority viewpoint, but a fusion of the two groups did not take place, since no agreement could be reached on the question of war credits. In April, 1919, the French Socialist Party voted to remain in the Second International, protested against the Peace Treaty of Versailles, and condemned the League of Nations. At the elections of 1919, it polled 1,750,000 votes, a gain of 40 per cent, but its representation in the Chamber was reduced to 55 seats. In 1921 the Communist element seceded from the Socialist Party and founded an independent organization, which polled 321,444 votes against 578,466 for the Socialists, in the elections of May, 1922. At its national congress at Lille, 1923, the French Socialist Party rejected a proposal from the Communists for united action against the occupation of the Ruhr and the danger of an imperialist war. On the same occasion, it voted for recognition of Russia. In the May elections of 1924, it increased its membership in the Chamber from 55 to 101 seats. With the secession of the Communist element, the party be-

came more moderate, this being manifested by its apparent willingness to support a Radical Socialist government, without, however, actually participating therein. During 1924-28 this continued to be the rôle of socialism in France.

SOCIAL PSYCHOLOGY. The new science of social psychology was called into being to supplement the science of individual psychology. The latter science, being investigated on an experimental, physiological basis, did not bring together the complex facts and tendencies of human life, as they manifest themselves in the interaction among individuals or among groups, and it was therefore necessary to add a new member to the intellectual encyclopædia.

The best illustration of the early development of social psychology is to be found in the writings of Wilhelm Wundt. For nearly half a century, the director of the Leipzig laboratory dominated the science of psychology in Germany. In his later years, he turned from individual psychology to *Volkpsychologie*, but he continued to apply the same "structural" formula—the search for elements and laws. He defined the social mind as an individual synthesis possessing actuality, although in his physiological psychology actuality was regarded as immediacy of experience and was therefore personal. Moreover, in dealing with the group as a synthesis, Wundt entangled himself in the same difficulty as in his apperceptive synthesis of the individual mind. The apperceptive synthesis was a union of psychophysical sensations, and yet it had a reality over and above its component atoms.

So, too, the group mind was a synthesis of individual minds and seemed to have a substantial existence of its own. Wundt held that the attributes of the group mind were to be determined by the analysis of its products; thus the attributes of the German mind were to be formulated by an analysis of the collective acts of the German people, those of the French mind by an analysis of French acts, etc.; but in practice, Wundt's laws of folk psychology were but applications of individual psychology; just as in practice his analysis of immediate psychological experience tended to be degraded more and more into mere physiology.

In Germany, Wundt's folk psychology met the opposition of those who approached collective phenomena from the study of history and the evolutionary development of peoples. Krüger was the leader of this group—the school of *Entwicklungspsychologie*, or developmental psychology of groups. The conflict paralleled the historic quarrel in France between the objective sociologists and psychologists like Gabriel Tarde who hoped to explain all social phenomena through the mechanism of the instinct of imitation.

In the United States and in England, the issues were never so sharply drawn; for one reason, because no rigorous discipline was developed for the study of social facts. McDougall's *Social Psychology* served for many years as a model for all students of the subject. Its method was thoroughly empirical—empirical, that is, in the British sense, without being objective. Inspired largely by the *Dynanic Sociology* of Ward, Professor McDougall had undertaken to put into relief the component individual motivations which go to make up the movement of life which we call society. These motivations were found in the instinctive equipment of the individual, together with the

emotions that were associated with the instincts (see *INSTINCTS*). Authorities disagreed as to the number of instincts and inherited dispositions man possessed at birth; whether these instincts were immutable or could be propitiated by a favorable environment; and, finally, as to the relation of these instincts to ethics and religion.

The most recent development in social psychology grows out of a number of contributing circumstances. The attack upon the conception of instincts, on which the social psychology of McDougall and others was founded, with the attempt to substitute the reflex as the only inherited mechanism, had a profound effect upon current thought. Added to this was the advent of the conditioned reflex (see *BEHAVIORISM*) which furnished the mechanism by which complex forms of behavior similar to those conceived as instincts could develop in the early life history of the individual. Furthermore, the psychoanalytic movement (see *PSYCHOLOGY, ABNORMAL AND PSYCHOANALYSIS*) looked upon social institutions and customs as powerful forces affecting the life of the individual, thwarting his desires, and distorting his behavior. The progress of mental measurement made available the instruments required for measuring the effects of one individual or a group of individuals upon the attitudes and actions of other individuals. These various factors have crystallized into a new social psychology represented by the work of F. H. Allport (*Social Psychology*, 1924). Its nature is indicated in the following quotation (Allport):

Social psychology is the science which studies the behavior of the individual in so far as his behavior stimulates other individuals, or is itself a reaction to their behavior, and which describes the consciousness of the individual in so far as it is a consciousness of social objects and social relations. . . . Behavior in general may be regarded as the interplay of stimulation and reaction between the individual and his environment. Social behavior comprises the stimulations and reactions arising between an individual and the social portion of his environment, that is, between the individual and his fellows. Examples of such behavior would be the reactions to language, gestures, and other movements of our fellowmen, in contrast with our reactions toward non-social objects, such as plants, minerals, tools, and inclement weather. . . . In and through others many of our most urgent wants are fulfilled, and our behavior toward them is based on the same fundamental needs as our reactions toward all objects, social or nonsocial. It is the satisfaction of these needs and the adaptation of the individual to his whole environment which constitute the guiding principles of his interactions with his fellowmen.

There is no place in this conception of social psychology for a "collective mind," or a "group consciousness." See William McDougall, *The Group Mind*, 1920.

There is no psychology of groups which is not essentially and entirely a psychology of individuals. Social psychology must not be placed in contradistinction to the individual, it is a part of the psychology of the individual, whose behavior it studies in relation to that sector of his environment comprised by his fellows.

For a criticism of the point of view of Allport, see R. S. Woodworth, "Social Psychology: A Review," *Journal of Abnormal and Social Psychology*, 1925.

Typical of the experimental studies of the interaction among individuals and groups are F. H. Allport, "The Influence of the Group upon Association and Thought," *Journal of Experimental Psychology*, 1920; H. E. Burt, "Sex Differences in the Effects of Discussion," *Journal of Experimental Psychology*, 1920; L. E. Travis, "The Effect of a Small Audience upon Eye and

Hand Coördination," *Journal of Abnormal and Social Psychology*, 1925. Among the more important systematic treatises on Social Psychology are F. H. Allport, *Social Psychology*, 1924; L. L. Bernard, *An Introduction to Social Psychology*, 1926; C. A. Ellwood, *Introduction to Social Psychology*, 1918; Knight Dunlap, *The Foundations of Social Psychology*, 1925; R. H. Gault, *Social Psychology*, 1923; William McDougall, *The Group Mind*, 1920; E. A. Ross, *Social Psychology*, 1915.

SODDY, FREDERICK (1877-). A British physicist, chemist, and economist (see VOL. XVI). He held the professorship of chemistry at Aberdeen from 1914 to 1919, when he became Lee's professor of inorganic and physical chemistry at Oxford. In 1921 he was Nobel Prize winner in chemistry. He is the author of *Science and Life* (1920), *Cartesian Economics* (1922); *Inversion of Science* (1924), *Wealth, Virtual Wealth and Debt* (1926); and *The Wrecking of a Scientific Age* (1927).

SÖDERBLOM, LARS OLOF JONATHAN (NATHAN) (1866-). A Swedish archbishop and ecclesiastical historian. Born in Helsingland and educated at Hudiksvall and the University of Upsala, he served as pastor of the Swedish church in Paris (1894-1901) and as professor of ecclesiastical history in the University of Upsala and, in 1912-14, at Leipzig University. In the latter year, he became Archbishop of Upsala and pro-chancellor of the University of Upsala. In 1921 he was elected to the Swedish Academy. His works include *Religionsproblemet* (2 vols., 1911); *Naturliche Theologie und allgemeine Religionsgeschichte* (1913), *1r Religionsens historia* (1915), *Religionen och staten* (1918), *Narstunderna varla* (4 vols., 1921), *Christian Fellowship* (1923), also in German, Swedish, and Dutch, *Kristenhetens Moete* (1926), *Kristi Pians Historia* (3d ed., 1928); *Die Einheit der Kirche und der papstliche Stuhl* (1928).

SOILS. Important advances are being made in the efficient use of the soil in crop production. Soils are being surveyed and mapped and the best crop adaptations and methods of soil management are being determined with a certainty not heretofore possible. The potential possibilities thus disclosed have gone far to allay fear of an imminent shortage of food with increasing population.

One of the most important of the many agencies fostering the study of soils is the International Society of Soil Science. The First International Congress of Soil Science, held at Washington in 1927, under the auspices of this society and of the American Society of Agronomy, brought together a representative body of scientists from all parts of the world to discuss soil problems, and gave a great impetus to the application of science to their solution.

Soil surveying and mapping is of world-wide interest as an aid in the better utilization of soils. A generalized soil map of Europe has recently been made under the auspices of the International Society of Soil Science, and a similar map for the United States has been prepared by the Bureau of Soils of the U. S. Department of Agriculture. Less comprehensive and complete soil maps are available for other regions. These soil surveys are especially useful in dif-

ferentiating lands which can be profitably tilled from those that are marginal or of doubtful value for cultivation, and in determining those especially suited to certain kinds of crops. The soil surveys of the United States by 1929 had covered over 800,000,000 acres, or about one-half of the arable area of the country. With such knowledge as these surveys, supplemented with more detailed investigation in soil fertility, supply, the present tendency in the United States is to discourage the bringing of more land under cultivation but to encourage the making of better use of that already available.

Soil conservation, particularly protection against erosion, is receiving much attention. The grave consequences of unrestrained soil erosion, as typically illustrated in China, is evident in varying degrees in other countries. It has been estimated that 15,000,000 acres of tillable land have been rendered permanently unproductive in the United States by erosion, and that the annual loss to farmers from this cause amounts to over \$200,000,000, involving a loss of soil fertility far in excess of that resulting from the growth and removal of crops. Progress is being made in determining the kinds of soil most subject to destructive erosion and the best means of preventing it. The relation of soil colloids and various physical and chemical properties to erosion are being studied, and the advantages of terracing and plant cover as preventive measures have been demonstrated.

Recent investigations emphasize the importance of certain minor constituents of soils, such as manganese, copper, iodine, and others, in relation to production and the food and forage value of crops. It seems clear that these substances play a more important part in this respect than has been fully recognized. The relation of crops to varying degrees of acidity or alkalinity of the soil is becoming better understood as a result of continued study of the subject, as are the best means of adjusting such conditions to different kinds of crops.

Bibliography. From the voluminous literature on soils, the following have been selected as representative sources of information on the subject. M. Whitney, *Soil and Civilization* (New York, 1925); R. P. Teele, *The Economics of Land Reclamation in the United States* (Chicago and London, 1927); T. L. Lyon and H. O. Buckman, *The Nature and Properties of Soils* (New York, 1922); Edward J. Russell, *Soil Conditions and Plant Growth* (London and New York, 1927); Sir John Russell, *Farm Soil and Its Improvement* (London, 1923); M. F. Miller, *The Soil and Its Management* (Boston and London, 1924); F. E. Bear, *Soil Management* (New York and London, 1927); J. F. Cox, *Crop Production and Soil Management* (New York, 1925); E. L. Worthen, *Farm Soils: Their Management and Fertilization* (New York and London, 1927); F. V. Coville, "The Agricultural Utilization of Acid Lands by Means of Acid-Tolerant Crops," in U. S. Department of Agriculture *Bull.* 6 (1913); S. A. Waksman, *Principles of Soil Microbiology* (Baltimore, 1927); P. Ehrenberg, *Die Bodenkolloide* (Dresden and Leipzig, 1922); F. S. Harris, *Soil Alkali* (New York, 1920); H. H. Bennett and W. R. Chapline, "Soil Erosion a National Menace," in U. S. Department of Agriculture *Circ.* 33 (1928). *Proceedings and Papers of the First International Congress of Soil Science*, vols. i-iv (Washington, D. C., 1928); U. S. Department of Agriculture Library, *Bibliograph-*

ical Contributions 13, A Classified List of Soil Publications of the United States and Canada (June, 1927); *14, List of the Publications on Soils Issued by the U. S. Department of Agriculture, 1844-1926* (May, 1927); and *15, List of the Publications on Soils Issued by the State Agricultural Experiment Stations of the United States through 1926* (July, 1927).

SOISSONS. See **WORLD WAR, Western Front.**

SOKOLOFF, sò-kò'lòf, NIKOLAI (1886-). An American violinist and conductor, born at Kiev, Russia. Having received his first instruction from his father, he entered the Yale University School of Music in 1899, studying the violin under C. M. Loeffler. In 1903, he became a violinist in the Boston Symphony Orchestra. His career as a virtuosa began in 1911 with a tour of England and France. For a time, he lived in San Francisco, where he organized a string quartet in 1916 and made his début as conductor with the Philharmonic Orchestra there, which he conducted during the summer of 1916. In 1918 he became conductor of the Cleveland Symphony Orchestra, which he brought to a high degree of efficiency. He also appeared as guest-conductor with several of the great American orchestras and with the London Symphony Orchestra. In 1919 he formed a string quartet with Edlin, Kalodkin, and de Gomez, members of the Cleveland orchestra.

SOLAR PHYSICS. See **PHYSICS.**

SOLAR SYSTEM. See **ASTRONOMY; PHYSICS.**

SOLE, WILHELM (1862-). A German public official, born in Berlin. He was much interested in the Oriental languages, studied Sanskrit, and lived a long while in Calcutta. Returning to Germany, he studied political science and was appointed Governor of German Samoa in 1900 and German colonial secretary in 1911. He achieved much success in the reform of German colonial administration. He was appointed Secretary of State for Foreign Affairs in October, 1918, and in this capacity conducted the negotiations for the Armistice. He continued to hold this office under the revolutionary Socialist government until December, 1918, when he resigned. In 1920 he was appointed Ambassador to Tokyo. He wrote *Weltpolitik und Kolonialpolitik* (1918), and *Kolonialpolitik, Mein Politisches Vermächtniss* (1919).

SOLOMON ISLANDS. See **PACIFIC OCEAN ISLANDS.**

SOMALILAND. A British African protectorate comprising the Somali Coast on the Gulf of Aden, extending from Labadu to Bandar Ziyada. Its area is 68,000 square miles; its population about 344,700, for the most part Mohammedan and nomadic in character. The chief towns had, by the 1921 census, the following populations: Berbera, 30,000; Zeyla, 7000; Bulhar, 7300. The exports are largely pastoral in nature, i.e., skins and hides, cattle and sheep. The imports are foodstuffs and textiles. Exports for 1927 were £355,575, as compared with £216,596 in 1913-14. Imports for 1927 and 1913-14 were £427,516 and £238,218. Expenditures still continue in excess of revenues and imperial grants-in-aid are necessary to make up deficits. Revenues for 1926-27 were £90,568 (largely from customs); expenditures, £149,125. Transport still depends for the most part on the camel. In 1920 the Mullah Mahommed, who for

20 years dominated the interior and consistently fought off the attempts at British penetration, was completely broken when an attack from the air by British airplanes wrecked his camp and killed great numbers of his followers. He himself died in hiding soon afterward, and with him passed the power of the dervishes. British rule was thus triumphant.

French Somali Coast. A French colony lying between Italian Eritrea and British Somaliland on the Gulf of Aden. Area, 5790 square miles; population (estimate of 1928) 85,778. Jibuti, the largest town in 1921 had 8306 inhabitants of whom 354 were Europeans. Chief exports include hides and skins, ivory, salt, and fish; total in 1926, 401,543,750 francs. Chief imports are cotton goods and foodstuffs; total in 1926, 457,751,424 francs. A large share of the trade was in transit to and from Abyssinia via the railway from Jibuti to Addis-Abeba (590 miles). The influence of the railway (completed in 1917) on trade was seen in the increased tonnage entering Jibuti. In 1912, 247 ships of 737,748 tons entered; in 1926, 1423 ships (245 French) of 1,145,271 tons. The local budget for 1928 balanced at 13,002,000 francs. As a result of the enlightened colonial policy, the natives continue orderly.

Italian Somaliland. A colony and three protectorates of Italy extending along the east coast of Africa from British Somaliland to the Juba. Area, 190,000 square miles; population about 1,200,000. Mogadiscio, the capital of the colony, has a population of 25,000. Attempts were made in the south, in the colony, to turn the native Somali from pastoral pursuits toward agriculture. In 1922, under the Duke of Abruzzi, 7500 acres were put under cotton. In the north, however, the native products continue to be cattle, sheep, and skins. Exports for 1927 were 25,300,950 lire, imports, 156,246,673 lire. Leading imports are cotton goods, sugar, rice, petroleum, yarn. Leading exports are hides (from 75 to 80 per cent), dura, maize, gum, butter, cotton. The budget for 1928-29 called for revenues and expenditures of 76,255,250 lire. There are no railways. Mileage of roads in 1928 was 1500 miles. Communications were maintained by 29 wireless stations. By the secret Treaty of 1915, to facilitate Italy's entry into the War, Great Britain agreed to augment Italy's territories to the right of the Juba River in order to assure Italian control of this important watercourse. Italy also obtained the port of Kismayu. See **AFRICA, History.**

SOMERVILLE, sòm'èr-vil. EDITH ANNA GENONE (1861-). An Irish novelist and artist, specializing in illustration (see Vol. XXI), who collaborated as an author with her cousin Violet Martin ("Martin Ross," died 1915). Miss Somerville had exhibitions of her paintings at the Goupil Galleries (1920) and at Walker's Gallery (1923 and 1927). Her later books include *Irish Memories* (1918); *Mount Music* (1919); *Strayaways* (1920); *Wheel-tracks* (1923); *The Big House of Inver*, and *French Leave* (1928). Although Miss Martin was dead, the books were still signed Somerville and Ross. In 1927 a deluxe edition of their sporting works, called the Hitchcock edition, was published.

SOMME, BATTLES OF THE. See **WORLD WAR, Western Front.**

SOMMERFELD, ARNOLD JOHANNES WILHELM (1868-). A German physicist, who was born at Königsberg and educated at the uni-

versity there. He has been professor of theoretical physics at the University of Munich since 1906. In 1929 he was elected a foreign associate of the National Academy of Sciences (American). He has published numerous works on physics, including *Atomic Structure and Spectral Lines* (trans. 1923); *Three Lectures on Atomic Physics* (trans. 1926); *Probleme der modernen Physik* (1928).

SONIC SOUNDING. See NAVIGATION.

SONNECK, OSCAR GEORGE THEODORE (1873-1928). An eminent American musicologist (see Vol. XXI). In 1921 he became vice president of G. Schirmer, Inc. and when the American section of the International Society of Contemporary Music was organized in 1923, he was elected its first president. In 1927 he was chosen by the Government to represent the United States at the Beethoven Centennial in Vienna. He added to the list of his publications: *Early Opera in America* (1915); *Suum Cuique*, a collection of essays (1916); *Miscellaneous Studies in the History of Music* (1921); *Beethoven Impressions of Contemporaries* (1927); *Beethoven Letters in America* (1927); *The Riddle of the Immortal Beloved* (1927).

SONNINO, sōn-nē'no, SIDNEY, BARON (1847-1922). An Italian statesman (see Vol. XXI). He was Minister of Foreign Affairs in Salandra's cabinet (1914-16), during which time he negotiated the secret Treaty of London, and again under Orlando during the Peace Conference, which he attended as second Italian delegate from Jan 18 to June 19, 1919, when he retired on the Orlando cabinet's going out of office. Sonnino was blamed in some quarters for the Allies' policy toward Italy at the Peace Conference. He was later made a senator. In 1925 his parliamentary speeches were published in three volumes.

SOREL, sō-lē', GEORGES (1847-1922). A French engineer and social philosopher (see Vol. XXI). During the World War, he temporarily left the syndicalist ranks and seemed to accept the ultra-nationalistic philosophy of Maurras. The Russian Revolution, however, brought back his faith in social reform through violence, and in a new edition (1920) of his celebrated *Réflexions sur la Violence*, he included a brilliant plea for the Russian Dictator, Lenin. Among his writings published since the War is a collection of essays under the general title, *De l'Utilité du Pragmatisme* (1919).

SORLEY, WILLIAM RITCHIE (1855-). A British philosopher (see Vol. XXI). He has held the professorship of moral philosophy at Cambridge University since 1900. His publications include *Moral Values and The Idea of God* (Gifford Lectures, 1918; 1925); *Reconstruction and the Renewal of Life* (1919); *The History of English Philosophy* (1920); and *Tradition* (1926).

SOROLLA Y BASTIDA, sō-lō'ya ē ha-stē'da, JOAQUIN (1863-1923). A Spanish painter (see Vol. XXI). His work for the Hispanic Society of America, which included a series of portraits of Spanish writers and a "Panorama of the Forty-Nine Provinces of Spain," was finished in 1920, and was the last work done before he became paralyzed. The Hispanic Society's museum in New York contains the largest and best collection of his paintings.

SOSMAN, ROBERT BROWNING (1881-). An American chemist born at Chillicothe, Ohio. He studied at Ohio State University and received

his Ph.D. (1907) from the Massachusetts Institute of Technology. In 1908 he entered the service of the Geophysical Laboratory of the Carnegie Institution of Washington as physicist. He was consulting chemist of the nitrate division of the Ordnance Bureau of the United States Army during the World War. His special investigations included studies of the electromotive force of solutions, conductivity and ionizations of aqueous solutions 0-300°, specific volume of minerals at fusion temperatures, and other similar topics pertaining to mineral chemistry and physics. He wrote *The Properties of Silica* (1927).

SOUND. See AUDITION; PSYCHOLOGY, EXPERIMENTAL; PHYSICS.

SOUNDING, DEEP-SEA. See NAVIGATION.

SOUTH, UNIVERSITY OF THE. An institution of higher education founded at Sewanee, Tenn., in 1857, under the auspices of the Protestant Episcopal Church. The student enrollment increased from about 160 in 1914 to 345 in the fall of 1928; the members of the faculty from 20 to 28; and the library from 35,000 to 43,000 volumes. The productive funds were \$400,000 in 1914 and largely through an endowment campaign carried on in 1919, the income was increased from \$125,000 in 1915 to \$341,000 in 1928. A stone dormitory was opened in 1921 and courses in forestry were added to the curriculum in 1923. President, Benjamin Ficklin Finney, LL.D.

SOUTH AFRICA, UNION OF. A self-governing British Dominion, constituted by the South African Act of September, 1909, as a legislative union, comprising the provinces; the Cape of Good Hope, Natal, Transvaal, and the Orange Free State. Total area 471,917 square miles. Total population in 1928 was estimated at 7,777,583, as compared with 5,973,394 in 1911. Whites increased from 1,276,242 to 1,738,937 in the same period. Natives in 1928 numbered 5,277,023; Asiatics, 183,771, and mixed and others, 577,852, according to official estimates. In 1921 Europeans included 21.93 per cent of the total population. Of the white population (1921), 847,508 were classed as urban and 671,980 as rural, urban colored numbered 888,177 and rural, 4,520,915. The total European population according to the final audit of the 1926 census was 1,676,660, an increase of 10.34 per cent since 1921.

There were 115.92 white males to 100 white females in 1911 and 106.05 to 100 in 1921. The following record the marriage, birth, and death rates of whites per 1000 of the white population for 1913 and 1921: marriage rate, 9.08 and 8.48; birth rate, 31.68 and 28.42; death rate, 10.27 and 10.41. Provincial towns in 1921 were: Johannesburg, Transvaal, 288,131, of which 151,836 were white; Cape Town, Cape of Good Hope, 207,404, of which 113,302 were white; Durban, Natal, 146,310, of which 57,095 were white; Pretoria, Transvaal, 74,052, of which 45,361 were white; Port Elizabeth, Cape, 46,094, of which 25,982 were white; East London, Cape, 34,673, of which 20,374 were white.

Religion and Education. In 1921 whites professed the following faiths: Dutch churches, 838,982; Anglicans, 294,026; other Protestants, 207,466; Roman Catholics, 61,246; Jews, 63,103. In 1913 there were 4286 schools for whites with 203,421 pupils which increased by 1927 to 4665 schools with 336,459 pupils; in 1913 there were 2363 schools for colored pupils with 167,708 pupils, which increased by 1927 to 3501 schools

with 304,617 pupils. Expenditure for education increased from £2,268,026 to £6,766,688. Primary and secondary schools are controlled by the four Provincial Administrations. In 1927 there were 10 institutions of higher learning with 6460 students and 682 instructors. In 1918 the University of the Cape of Good Hope was divided into three universities, viz., University of Cape Town, University of Stellenbosch, University of South Africa. The other six institutions became constituent colleges.

Agriculture. This industry has made great advances in recent years, partly as a result of the stimulus of high prices during the World War, but as much because of the enlightened interest manifested by the Union agricultural department which coordinated the activities in all four provinces. The maize crop increased from 863,252 tons in 1911 to 1,381,500 tons in 1927. Similarly, wheat increased from 181,032 tons in 1911 to 276,289 tons in 1926. The 1918 crops were 304,485 tons wheat and 1,264,009 tons maize. Other crops include oats, barley, kaffir corn, potatoes, citrus and deciduous fruits, and tobacco. Droughts and locusts are frequent. Cotton culture has gained in popularity. In 1910, 22 bales were produced, in 1926, 24,936,775 pounds of unginned cotton. The 1927 crop was 11,822,612 pounds. In Natal and the native reserves, the yield of sugar cane was 2,311,293 tons in 1926. Tea and tobacco showed little or no advances. The pastoral industries rank high in importance. Stocks increased from 1911 to 1927 as follows: sheep, 30,656,000 to 40,109,826; cattle, 5,796,000 to 10,109,826. In 1927 there were 7,565,613 goats and 848,272 swine. Horses numbered 856,040 in 1926, when there were 103,668 ostriches.

Wool production, measured in exports, showed gains. In 1913, 176,971,000 pounds were exported; in 1928, 285,000,000 pounds. Mohair (derived from the Angora goat) maintained its important position. In 1928, 8,250,000 pounds were produced. By 1921, the Union was self-sufficing as regards its meat and dairy supplies and was even beginning to export considerable quantities of both. Ostrich-farming, which had been hard hit during the War, recovered to some extent after the Armistice. The great yield of 1913 of 1,023,000 pounds of ostrich feathers glutted the market so that production during the ensuing years dropped. The number of ostriches dropped off steadily. Irrigation projects from 1912 on became the interest of the Government. In 1921-22 a total of £1,010,000 was spent. In 1922 the works in the Lake Mentz region along the lower course of the Sunday River were opened. These serve 4900 acres. The project aimed ultimately to reach 40,000 acres. In 1921 the total area under irrigation was 808,899 acres. In 1925-26, £403,137 were spent on irrigation, and in 1926-27, £342,918.

Manufacturing. The War gave an impetus to local industries. The number of establishments increased from 3998 in 1916 to 7172 in 1926-27. Leather tanning extract, tobacco, cement, showed the greatest advances. Value added to products by manufacture in 1926-27 was £47,507,685, gross value of manufactured products in 1926, £97,878,822. Average number of persons employed in 1926-27, 202,689, of whom 80,755 were Europeans. Local industries were encouraged by tariffs and rebate during 1914-19, and from 1921 on the Government applied itself to aiding industrial developments. Boun-

ties were offered for pig iron manufactured, for steel produced from native ores, and for meat exported.

Mining. The gold-mining industry is the dominating factor in the economic life of the Union of South Africa. In 1927 the value of mineral production was £61,158,470, to which gold contributed £42,997,608, diamonds, £12,392,308, and coal, £3,825,664. The production of the more important minerals was as follows: asbestos, 22,043 short tons; coal, 13,306,000 short tons (in 1928, 13,388,000); copper, 10,741 short tons; diamonds, 4,708,000 carats; gold, 10,122,000 fine ounces; silver, 1,012,000 fine ounces; tin concentrates, 1929 short tons. The diamond situation in the Union was so demoralized in 1927 by the discovery of alluvial deposits in western Transvaal, that governmental intervention became necessary, and a comprehensive alluvial diamond act was passed in October, 1927, curbing the alluvial production at once and giving the Government broad powers of restriction and regulation of output.

Commerce. The following are total import and export figures for selected years

	1911	1919	1927
Imports	£38,035,000	£50,791,000	£73,955,308
Exports	£57,308,000	£104,561,000	£80,046,654

Leading imports are foodstuffs, cotton piece goods, machinery, oils, wood, hardware, iron and steel manufactures, and leather goods. Leading exports are gold, wool, diamonds, hides and skins, corn, mohair, and coal. Proportions of the merchandise import trade by countries of origin, for 1910 and 1927, were Great Britain, 70 and 42.8 per cent; United States, 8 and 15.3 per cent. In 1927 German imports were 6.2 per cent (9 per cent in 1913). Proportions of export trade by countries of destination, for 1910 and 1927, were, Great Britain, 81 and 65.2 per cent; United States, 17 and 2.2 per cent. Exports to Germany for 1927 were 5.7 per cent. Principal imports from the United States are oils, automobiles, cotton piece goods, hardware and cutlery, lumber and agricultural and mining machinery. The leading ports are Cape Town, Durban, Port Elizabeth, and East London. In 1912, 4106 vessels of 12,205,300 tons entered, and 4080 vessels of 12,163,081 tons cleared, the ports. In 1927 these were entered, 1403 vessels of 5,268,000 tons, cleared, 1389 of 5,250,000 tons.

Transportation. In May, 1910, the provincial railways were amalgamated into a single system denominated the South African Railways under the control of the Union. To this were added the railways of Southwest Africa in April, 1922. On Dec. 31, 1913, the total government mileage was 8282, in March, 1927, this was 12,624 miles. New lines built were from Prieska to Kalkfontein, for military purposes; Krugersdorp to Mafeking; the completion in the Cape Province of the Mossel-George-Oudtshoorn line connecting Cape Town and Port Elizabeth. In 1913 earnings of the railways were £13,214,000; in 1926-27 they were £24,093,347.

Finance. Revenues and expenditures for 1911-12 were £17,369,030 and £13,234,505 and for 1927-28 £30,094,004 and £23,008,174. The budget for 1928-29 estimated ordinary receipts at £27,516,000 and ordinary expenditures at £22,641,137. Chief sources of revenue are income, super-excess profits and dividend taxes, customs

and excise, interest, posts, telegraphs, and telephones. Native taxes are hut and poll taxes. The public debt in 1912 was £117,260,534; in 1928, £238,926,064. Expenditures for war purposes raised by loans during 1915-22 totaled £23,173,985. After 1913 the provinces were made to depend for their finances upon assigned revenues made to them by the Union together with annual subsidies limited to 50 per cent of their normal expenditures. Expenditures were primarily for education. In June, 1921, a central Reserve Bank was established at Pretoria with branches at Cape Town and other important centres. The subscribed capital was £1,000,000 and on Dec. 31, 1927, the Bank had issued £7,200,000 in notes. On June 30, 1922, the note-issuing powers of the joint-stock banks had come to an end. In addition to its functions as a bank of issue, and the principal holder of the gold reserves of the country, the Reserve Bank operated as a bank of discount.

In 1929 the Union of South Africa decided to maintain a legation in the United States and Eric H. Louw was made the first Minister.

History. The generation of Boers who had fought against Great Britain in 1902 was alive when the World War broke out in Europe. Many of the Boers still entertained nationalistic aspirations and saw in the War an opportunity to gain release from the domination of the British Empire. However, the more important Boer leaders, such as Botha and Smuts, were true to the British purpose and by the weight of their example gained the Union for the Allies and gave material assistance in subjugating the German African colonies. The Dutch nationalistic cause was, nevertheless, real, and in 1914 assumed serious proportions. The immediate reason for the disaffection was the decision of the Government to send a force against German Southwest Africa. In October, 1914, a serious rebellion was launched by Boer irreconcilables most of whom sought to further their own aims rather than the purposes of Germany. The leaders were General de Wet and General Beyers, while the man to whom all looked for inspiration was General de La Rey. Unfortunately for the rebels, General de La Rey was shot and killed by a police patrol on Sept. 15, 1914, while on his way to join the insurgent camp. The rebellion broke out actively, however, under de Wet and Beyers, and General Botha was obliged to take the field against his erstwhile companions in arms. After some desultory fighting, the Boers were dispersed and de Wet surrendered (Dec. 1, 1914) and Beyers was drowned in the Vaal River while trying to evade capture (Dec. 9, 1914). The losses were not heavy, although the forces engaged were considerable. In all, 10,000 rebels had taken up arms. Only one of the leaders, Fourie, was sentenced to death for his part in the insurrection. Clemency was shown to the others in the way of light prison sentences, so that by December, 1915, de Wet was free.

With active opposition gone, the move on German Southwest Africa went through successfully, with the result that by July, 1915, the colony was subjugated. Considerable aid also was rendered by Briton and Boer alike in the European and East African campaigns, 150,000 South Africans seeing service. Throughout the war period, the Dutch Nationalists, led by General Hertzog, continued in opposition and a coalition of the South African Party (Botha-Smuts) and the Unionists was necessary to carry on the govern-

ment. Republican propaganda became more and more virulent and by 1917 the Nationalists were outspoken in favor of a republic. They appealed to President Wilson to intercede; in fact, General Hertzog made a trip to Paris via New York to lay the matter before the President, but without success. At Versailles, Botha and Smuts signed the treaty for the Union. Botha having died in 1919, Smuts became Prime Minister. The election of 1920 indicated that the Nationalists had gained ground rather than lost. The poll showed: Nationalists, 45; South Africans, 40; Unionists, 25; Labor, 21. The only hope for a strong government was a permanent alliance between the two pro-British parties, and this Smuts was able to effect after many pourparlers in 1920. The election of 1921 could therefore be held on the frank issue of republicanism. The result gave Smuts a clear majority, the poll returning 76 of the enlarged South African Party, 47 Nationalists, 10 Laborites.

In 1922, the Nationalists and Laborites came to an understanding by which the urban districts were to be contested exclusively by Labor candidates and the rural districts by Nationalists, the condition being, however, that the Republican agitation was to cease for the life of the existing Parliament; however, the Nationalists openly set forth their secessionist principles the following year with the result that two of the most important Labor leaders, Colonel Creswell and Mr. Barlow, were estranged. Inherently weak as the Labor-Nationalist alliance was, it harried the Government during three uneasy years, reduced the Government's parliamentary majority, little by little, until it was finally only four, and eventually provoked General Smuts to dissolve the Union Parliament on Apr. 7, 1924, and appeal to the electorate in a general election. From 1921 on, the Government had been steadily losing ground, for a variety of reasons. The Nationalists still smarted under the defeat of 1914, the Laborites resented the severity with which strikes had been suppressed, there was general complaint over the fact that Smuts had consistently neglected common affairs because of his international interests. The result was, in the elections of June, 1924, a decisive defeat for the Government's party and the return of the Labor-Nationalist alliance. Even Smuts himself lost his seat. General Smuts resigned on June 23, and was succeeded by a Labor-Nationalist coalition headed by General Hertzog. Colonel Creswell, leader of the Laborites, joined the cabinet with the portfolio of Minister of Defense and Labor. Particularly significant was the pact of April 21 between the two government groups which was to serve as the basis of the coalition. By it, the Nationalists promised to relinquish their secessionist agitation for five years, while the Laborites, for the same period, pledged themselves to refrain from Socialist propaganda.

Within the next year or two, the coalition Government introduced a large number of measures calculated to reshape governmental policies in accordance with their ideas. None aroused such a storm of controversy as that for the adoption of a Union flag, in line with an effort to define South African nationality more precisely. The bill was introduced in May, 1926. It derived its importance from the fact that the selected design did not include the Union Jack, symbol of the British Empire. At once, the old fires of racialism as between Briton and Boer, quiescent now for some time, blazed up anew.

The Premier's party opposed the Union Jack as the remainder of "domination, conquest, and defeat," while the British faction was so determined to include it that threats of disunion were heard if the Government's design should be adopted. In the meantime, Premier Hertzog departed for London to attend the important Imperial Conference. The chief work of the conference was to define more closely the changed status of the dominions within the Empire, and the result of its deliberations, the recognition of an equal and autonomous position for all the dominions and for Great Britain, was so gratifying to General Hertzog that he declared it removed "all further grounds of doubt and suspicion" as to the national status of South Africa. He spoke also in warm terms of the helpful attitude of British statesmen.

When the flag question again came up in the session opening in January, 1927, there was accordingly a more favorable atmosphere for negotiation and agreement; but in the following months, the conciliatory feeling was dissipated as the debate again became bitter in the extreme. It was October before an agreement was finally reached by adopting two flags, the Union Jack and a flag with horizontal stripes of orange, white, and blue, and a shield bearing the Union Jack and the emblems of the former Orange Free State and the Transvaal. The two flags were to be flown over government buildings in the Union and provincial capitals, in ports, and over government offices abroad.

The coalition between the Nationalist and Labor parties continued to work harmoniously; but in 1928 the success of the arrangement was threatened by factionalism in the Labor ranks, which split the party wide open. As the 1929 elections approached, the old controversy between adherents of the Empire and secessionists threatened to break out again when the Government proposed a trade treaty with Germany. It was denounced as being directly opposed to the idea of imperial preference which the Union had previously advocated. It formed a leading issue in the elections, which were held on June 12, 1929.

The other issue brought forward most prominently was the perennial dispute over the status of the natives, which came to the front again when the Assembly, on February 25, failed to give the two-thirds vote necessary for adoption to the Premier's native-representation bill. When this failed, he abandoned the rest of his programme relating to the question of relations between natives and whites. The election resulted in a decisive victory for the Nationalists, to whom early reports gave 71 seats in the Assembly, a clear majority over all. The South African Party obtained 50 seats, the Creswell Laborites, 5, and the National Council Laborites, 3.

Among the major problems which presented themselves in the post-war years was that relating to the status of immigrants from India. It was very acute on the eve of the War, but was allowed to rest during the world conflict, partly for the sake of patriotic solidarity, and partly because of the agreement which had been reached in 1914 between General Smuts and Mahatma Gandhi (whose leadership of the passive-resistance movement among the Indians of South Africa before the War served as training for his subsequent and more prominent career in India). By this agreement, the Government promised that the existing laws relative to the rights of Indians in the Union would be enforced in a just manner and with due regard to vested rights;

this was generally understood to mean that the rights of Indian residents would not be further curtailed by legislation or by administrative interpretation of the laws.

During the war period, however, this interpretation was challenged. In the Transvaal, where by a state law Indians were forbidden to purchase land, as individuals, the Indian merchants evaded this restriction by forming joint-stock companies to acquire real estate. The frequency of their purchases alarmed the white community, who insisted on the prohibition of this practice by new legislation, and accordingly an act of the Union Parliament in 1919, forbade corporations of Asiatics to acquire realty. Once more race hatred burst into flames. Curiously enough, the most frenzied agitation against the "Asiatic peril" was not in Natal, where about four-fifths of the 150,000 Indians in the Union were concentrated, outnumbering the whites, but in the Transvaal, where the number was relatively small. The explanation of the seeming paradox is that in Natal the greater number of the Indians were coolie laborers on sugar and tea plantations, whereas in the Transvaal the Indians were merchants and traders, often prosperous and aggressive business men whose competition was feared, perhaps in an exaggerated degree.

The Union government in 1920 appointed an Asiatic Inquiry Commission to go into the whole matter. The Commission's report, dated March, 1921, sustained the 1919 law and recommended that in Natal Asiatic landownership for agricultural purposes should be confined to the coastal zone, while elsewhere a policy of voluntary segregation should be pursued. This expression of anti-Indian sentiment, though couched in the most restrained terms, was sufficiently pointed to evoke a protest from the Government of India, which, by the way, was at this time manifesting grave concern regarding the rights of Indians in Kenya Colony (see KENYA). When, in the summer of 1921, the problem was aired in the British Imperial Conference at London, the determined efforts of the Indian government to secure the adoption of a general principle of equal rights for natives of India were met by an even more determined, and successful, opposition by the South African delegates, General Smuts and Sir Thomas Smartt. There the matter rested. In 1924 a fresh outburst of racial antipathy was caused by agitation for and against the Class Areas Bill, which proposed to impose drastic restrictions, amounting almost to prohibition, on the holding of property, leases, and trading licenses by Asiatics, outside of designated areas.

The bill was violently denounced, but had the approval of the Assembly, and would no doubt have passed but for the fall of the Smuts government. An ordinance passed by the Natal Provincial Council, however, which also aroused intense opposition, received the Governor General's assent in December. It disfranchised Asiatics in local elections. In 1925 the Hertzog government revived the Class Areas Bill in an amplified form, which covered the recommendations of the Asiatic Inquiry Commission. Indian residents in South Africa at once became a unit in denouncing the measure. They appealed by cable to the Government of India, and sent a delegation to India in December, while another delegation came from India to South Africa at about the same time. As a result of the agitation, the Government of India suggested a round-table conference, which after some delay the Union gov-

ernment accepted. A deputation came from India to South Africa in December, 1926, and the conference on Feb. 21, 1927, arrived at a settlement which was accepted by both countries. Under it, the Reserved Areas bill was dropped, Indians domiciled in the Union were encouraged to conform to Western standards, and government aid was offered in a scheme of voluntary repatriation of Indians in South Africa.

More fundamental and far-reaching was the Government's other color problem, the determination of the status of the natives. Many Bantus were well-educated and engaged in the professions, and they demanded citizenship and equality of treatment. Contention centred around the question of segregation of natives in restricted areas, the Nationalists and South Africans favoring, and the Unionists opposing, such segregation. In 1920 a segregation act was passed applicable to the rural districts. It stood frankly for white supremacy and though it granted some autonomy to the natives, it held out no hope for political fusion of the two races. In 1923 an act was passed permitting natives to settle in urban districts.

After the Nationalists came into power in 1924, the Premier did not formulate a party policy on the natives question until Nov. 13, 1925. A series of proposals in brief gave the natives seven European representatives in the Assembly, to be elected by natives only; provided for a system of local and general councils with powers chiefly advisory; and did away with existing native franchise in the Cape Province. These measures, it was understood, were to be accompanied by the setting aside of additional land areas in which the natives were to be segregated. The proposals were not pressed until after the government had succeeded in forcing through a "color-bar" bill in 1926, which had been rejected in the previous year and which kept colored persons out of certain skilled employments. Premier Hertzog then introduced four bills incorporating the proposals already advanced, but they did not come up for discussion until March, 1927. No action was taken during the 1927 session. By the time of the January, 1928, session, opposition among not only the natives but also the more liberal Europeans in South Africa and even in England, as well as the church people, and others, had grown so strong that the Government, for the time being at least, dropped the bills entirely.

Labor troubles during the War period, among the natives particularly, were frequent and for some years after the War, there was great unrest. Strikes occurred on the Rand and elsewhere during 1917-20, and blood was spilled at Port Elizabeth in 1920. On May 24, 1921, at Bulhoek, a body of natives calling themselves Israelites, on refusing to disperse and leave for their homes, were fired upon and 400 casualties were the result. Labor unrest, due to the closing of the diamond mines after the depression of 1921, was equally acute. In 1922 a strike in the gold, coal, and diamond mines took on serious proportions and led to open warfare. A general strike was called on one hand, and martial law was declared on the other; Fordsburg, one of the strongholds of the strikers, was shelled and finally taken. Though hostilities were brief, the losses on both sides were 183 killed and 524 wounded. Financial losses were placed at \$25,000,000. The miners contended that owners were attempting to introduce wholesale native

labor and cut wages radically; the owners and the Government charged the outbreaks to the extremists who had communistic leanings. By 1925 the labor unrest which followed the war in South Africa as in the rest of the world, was fairly quieted and ensuing years were peaceful.

The Governor General of South Africa for 1914-20 was Lord Buxton; he was succeeded by Prince Arthur of Connaught, who in 1923 gave way to the Earl of Athlone.

SOUTH AMERICA, EARLY CIVILIZATION OF. See ETHNOGRAPHY.

SOUTH AUSTRALIA. A state of the Australian Commonwealth occupying the central and southern part of the continent. Area, 380,070 square miles; population (excluding aborigines) in 1911, 408,558, in 1928, 576,576, average annual increase, 2.45 per cent. Adelaide, the largest city, including suburbs, had 327,686 inhabitants in 1927 (200,117 in 1913). The area under cultivation continues to increase, the total in acreage in 1926-27 being 3,883,920. Wheat in particular shows gains. From 16,938,988 bushels of wheat in 1913-14, production mounted to 24,066,012 bushels in 1927-28. Other crops are barley, oats, hay, and vines. Pastoral activities continue to occupy a prominent rôle. Mineral production in 1927 amounted to £1,188,522, (£634,318 in 1913). Value of production for 1926-27, agricultural, £16,635,366; pastoral, £6,128,006; manufacturing, £13,077,334; mining, £1,032,353; dairying, £1,881,658; total, £41,154,716. Imports and exports for 1913 were £7,348,240 and £9,809,763; for 1926-27, £15,454,801 and £17,123,012. Government accounts showed revenues and expenditures for 1913-14, £4,822,766 and £4,604,129, for 1927-28, £11,346,903 and £11,621,834. The public debt, from £33,564,332 in 1914 mounted to £90,612,402 in 1928. See AUSTRALIA.

SOUTH CAROLINA. The thirty-ninth State in size (30,989 square miles) and the twenty-sixth in population; capital, Columbia. The population increased from 1,515,400 in 1910 to 1,683,724 in 1920, a gain of 11.1 per cent; estimated population, 1928, 1,864,000. The white population increased from 679,161 (1910) to 818,538 (1920), the Negro (which exceeds the white), from 835,843 to 864,719, native white, from 673,107 to 812,137; foreign-born white, from 6054 to 6401. Urban population rose during the decade from 224,832 to 293,987, rural, from 1,290,568 to 1,389,737. The growth of the principal cities was as follows: Charleston, 58,833 in 1910 to 67,957 in 1920, and 75,900 (estimated) in 1928; Columbia, 26,319 to 37,524, and 50,600 in 1928, estimated; Greenville, 15,741 to 23,127.

Agriculture. As South Carolina is one of the most important cotton-producing States, agricultural conditions have reflected the ravages of the cotton-boll weevil, which reached the State in 1918 or 1919. This is indicated by a comparison of the acreage and production of cotton for the various years. 1920, 2,946,000 acres, 1,023,000 bales; 1922, 1,912,000 and 492,000, 1924, 2,404,000 and 807,000, 1928 (estimated), 2,355,000 and 725,000 (See BOLL WEEVIL AND COTTON). The number of farms increased 9.2 per cent, or from 176,434 in 1910 to 192,693 in 1920, but thereafter fell sharply to 172,767 in 1925. The total acreage in farms decreased from 13,512,028 (1910) to 12,426,675 (1920) and 10,638,900 (1925). The improved land in farms totaled 6,184,159 acres in 1920, while the percentage of

total land area used for agricultural purposes decreased from 69.2 (1910) to 63.7 (1920) and 58.4 (1925). The total value of farm property mounted from \$392,128,314 in 1910 to \$953,064,742 in 1920, or 143 per cent, but fell back to \$523,084,383 in 1925; the average value per farm was \$2223 in 1910, \$4946 in 1920, and \$3028 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 59,969 were operated by owners; 368, by managers; and 112,430, by tenants. The comparative figures for 1910 were 64,350,863 and 11,221. White farmers in 1920 numbered 83,083, of whom 83,542 were native; the Negro farmers numbered 109,005. White farmers in 1925 numbered 82,186, and the Negro farmers, 90,581. Farms reported as under mortgage, 14,299 in 1920, numbered 15,521 in 1925. Dairy cows numbered 228,569 in 1920; 146,556 in 1925. The number of swine, 844,981 in 1920, was 534,642 in 1925. "Beef" cows decreased in number from 64,949 in 1920 to 60,391 in 1925; sheep, from 23,581 in 1920 to 14,418 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 17,064,000 bushels; wheat, 800,000; oats, 7,751,000; potatoes, 4,068,000. sweet potatoes, 4,214,000; tobacco, 82,288,000 pounds; peanuts, 6,900,000; and hay, 380,000 tons. Comparative figures for 1913 are corn, 38,512,000 bushels; wheat, 972,000; oats, 8,480,000, potatoes, 800,000, tobacco, 33,288,000 pounds; and hay, 244,000 tons.

Manufactures. The industrial development of South Carolina has been gradual but well maintained. The chief increase in recent years was in the various phases of cotton manufacturing. In 1920 there were six cities in the State with more than 10,000 inhabitants, having 10.3 per cent of the total population of the State. These cities, in 1919, reported 21.3 per cent of the value of the State's manufactured products. There were 1854 manufacturing establishments in the State in 1909, 2004 in 1919; 1134 in 1925; and 1059 in 1927. Persons engaged in manufactories numbered 78,040, 86,360, 100,144, and 108,992, respectively, and the capital invested amounted to \$173,220,870 in 1909, and \$374,537,636 in 1919. The value of the products in 1909 was \$113,235,945, in 1919, \$381,452,984; in 1925, \$373,359,810, and in 1927, \$358,334,205. The abnormal increase in value of products in and about 1919 being to a great extent due to the change in industrial conditions produced by the World War, statistics of this item cannot be used as an exact measurement of the growth of manufactures between the industrial censuses of 1914 to 1919.

The first industry as to value of product is the manufacture of cotton goods, valued in 1909 at \$65,930,000; in 1919, at \$228,440,000, in 1925 at \$230,665,000; and in 1927 at \$231,272,599. The manufacture of cottonseed oil and cake stood second till lately, with a product valued in 1909 at \$10,903,000, in 1919, \$38,675,000; in 1925, \$13,015,407; and in 1927, \$12,608,931. Fertilizers, formerly third, in 1909 were valued at \$9,025,000; in 1919, \$30,412,000; in 1925, \$15,972,729; and in 1927, \$11,739,872. The production of mineral and soda waters was next in order in 1909, \$740,000, in 1927 beverage products totaled \$3,186,308. The chief manufacturing cities are Charleston and Columbia.

According to the returns received at the quinquennial census of electrical industries taken

in 1928, the total output of electric current in South Carolina in 1927, as reported by the central electric light and power plants was 1,116,266,957 kilowatt hours, an increase of 32.2 per cent, as compared with 844,416,989 kilowatt hours generated in 1922. During the same period, the generator capacity increased from 292,880 kilowatts to 490,148 kilowatts, or 67.4 per cent. There were 58 electric light and power establishments in 1927 comprising 23 commercial and 35 municipal plants, as compared with 40 commercial and 47 municipal plants in 1922. In this period a number of municipal plants were abandoned in favor of commercial systems which assumed the generating stations and distribution lines.

Education. South Carolina has undoubtedly a more difficult educational problem than most of the other States, due to the extremely large Negro population and to the large rural population. Recent steps in educational progress have been chiefly toward mastering these difficulties. While South Carolina had in 1920 the largest percentage of illiteracy of any of the States, it also showed the largest decrease in the decade 1910-20. The movement has since continued. The Legislature has passed many important laws designed to improve educational conditions. Among these were the compulsory education law passed in 1918 and revised in 1920, which proved a great stimulus and incentive to school attendance and added thousands of pupils to the enrollment list. The general assembly of 1922 made unusually liberal appropriations for public education. The State has an excellent rural grade-school act, supplemented by an equalizing act guaranteeing the seven-month term. Great progress was made in vocational education, especially in agriculture, textiles, home economics, and the training of teachers. Cooperation is given by Clemson College, Winthrop College, and the State Colored College. The total enrollment in public schools in the academic year 1925-26 was 483,269. Of this number, 435,425 were enrolled in the kindergarten and elementary grades and 47,844 in the secondary grades. According to color, the enrollment was: white, 248,562, colored, 234,707. Of the colored pupils, only 7347 were enrolled in the secondary grades. In 1913, the total enrollment was 361,161; 167,914 white, 193,247 colored. The enrollment in the high schools in 1922 was 113,461. Expenditures for schools in 1925-26 were: current, \$12,603,571; outlays, \$3,454,795. The percentage of illiteracy in the State decreased from 29.6 per cent in 1910 to 23 per cent in 1920. Among the native whites, it decreased from 11.4 to 8.5 per cent; among the colored population, from 46.9 to 38.7. Among the foreign-born whites, it remained for both periods 6.5.

Finance. State expenditures in the year ended Dec. 31, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$12,815,410 (of which \$3,737,384 was aid to local education); for interest on debt, \$401,366; for permanent improvements, \$9,819,582; total, \$23,036,358 (of which \$10,564,098 was for highways, \$1,966,769 being for maintenance and \$8,597,329 for construction). Revenues were \$17,464,224. Of this, property and special taxes formed 32.8 per cent; departmental earnings and charges for officials' services, 7.5 per cent; sales of licenses and taxes on tobacco in various forms, soft drinks, and gasoline, 48.1 per cent. Property valuation was \$422,169,895; State taxation

thereon, \$2,894,979. Net State funded debt on Dec. 31, 1927, was \$29,566,742, chiefly in the form of highway bonds.

Political and Other Events. South Carolina, consistently Democratic since the Civil War, has experienced no political party overturn after 1914: Ellison D. Smith was reelected to the Senate in 1914, and Richard I Manning was elected governor. Governor Blease, whose term was a sensational one, brought it to a close by wholesale pardon of State prisoners. At the expiration of his term, he had freed more than 3000 prisoners as a protest against the prison laws of the State. In January, 1915, prior to his leaving office, he disbanded the organized militia of the State, as a result of a difference with the Federal War Department over its administration. Manning, on taking office, revised the order disbanding the militia. State-wide prohibition was adopted by a majority of the people, to go into effect Jan. 1, 1916. Governor Manning was reelected in 1916. It was necessary to hold two primaries, as under the South Carolina primary system, a nominee must receive a majority of all the votes cast. In the first primary, Blease led by more than 20,000 votes but lacked 500 of the majority. In the second primary, however, Governor Manning received the majority of the votes. In 1916 Wilson received 61,846 votes for President, and Hughes, 1550. Upon the death of Senator Tillman in 1918, Christie Benet was appointed senator and in November, N B Dial was elected as successor. R. E. Cooper was elected governor. On May 20, 1922, he resigned and was succeeded by Lieutenant Governor Wilson G. Harvey. In 1922 Thomas G. McLeod defeated Governor Blease in the Democratic primary for governor and was elected. The presidential vote in 1924 was Davis, 49,008, Coolidge, 1123, La Follette, 620, ex-Governor Blease was elected senator. Extensive development of hydroelectric power plants has proceeded for a number of years. In 1926 John D. Richards was elected governor. He made energetic efforts to enforce the State blue laws. In 1928 the presidential vote was Smith, 62,700, Hoover, 3188.

Legislation. In 1915 several important measures relating to the regulation of the liquor traffic were enacted. The Legislature in 1916 enacted a State system of rural credits. Liquor laws were amended, as were the laws relating to insurance and public utilities. The Legislature of 1919 put further restrictions on child labor and enacted compulsory school attendance of children under 14. The Legislature of 1921 provided for a State Board of Fisheries and passed an act regulating the storage, grading, and marketing of cotton and other nonperishable farm products. The Legislature of 1923 passed a measure under which cities with populations between 20,000 and 50,000 are permitted to adopt the manager plan of city government. The Highway Commission received authority over automobile traffic in 1925.

SOUTH CAROLINA, UNIVERSITY OF. A nonsectarian coeducational State institution at Columbia, S. C., chartered in 1801 and opened in 1805. The enrollment of students increased from 540 in 1915 to 1475 in the fall of 1928. The faculty consisted of 82 professors, instructors and assistants. Dormitories for men and a dormitory for women were completed in 1923-24 and in 1925 an addition to the school of pharmacy, a women's dormitory and the Abney Library were finished. In 1926 courses in music and art were added to the curriculum. Sloan College, a physics and engineering building; two annexes to the library; an athletic field house; and an astronomical observatory were erected in the following year. President, Davison McDowell Douglas, D.D., LL.D.

SOUTH DAKOTA. The fourteenth State in size (77,615 square miles) and the thirty-seventh in population; capital, Pierre. The population increased from 583,888 in 1910 to 636,547 in 1920, or by 9 per cent; estimated population, 1928, 704,000. The white population increased from 563,771 (1910) to 619,147 (1920), native white, from 463,143 to 536,756. The Indians decreased in number from 19,137 to 16,384 and the foreign-born whites, from 100,628 to 82,391. Urban population rose from 76,673 to 101,872; rural, from 507,215 to 534,675. There are two important cities in the State, Sioux Falls and Aberdeen. The former increased from 14,094 in 1910 to 25,202 in 1920; the latter, from 10,753 to 14,537.

Agriculture. As South Dakota is almost entirely an agricultural State, it was greatly affected by conditions which prevailed during and after the World War. From 1917 to 1920, there was a period of prosperity due to the world-wide demand for wheat and other grains which are the chief agricultural products of the State. This period was succeeded by depression caused especially by overproduction of wheat, which rendered this crop unprofitable. These conditions prevailed from 1921 to 1923. The number of farms decreased 3.9 per cent, or from 77,644 in 1910 to 74,637 in 1920, but rose thereafter to 79,537 in 1925. The acreage in farms increased from 26,016,892 (1910) to 34,636,491 (1920), but fell to 32,017,986 (1925). The improved land in farms totaled 18,199,250 acres in 1920. The percentage of the total land in farms rose from 52.9 in 1910 to 70.4 in 1920, dropping to 65.1 in 1925. The total value of farm property increased 142.2 per cent, or from \$1,166,096,980 in 1910 to \$2,823,870,212 in 1920, but shrank to \$1,658,921,488 in 1925; the average value of farm property was \$15,018 in 1910, \$37,835 in 1920, and \$20,857 in 1925. These values reflect alterations in the purchasing power of money incident and subsequent to the War. Of the total number of farmers in 1925, 46,160 owned their own farms; 331 were managers, and 33,046 were tenants. In 1910 owners numbered 57,984, managers, 431; and tenants, 1923. White farmers in the State in 1920 numbered 73,025, compared with 74,836 in

SOUTH DAKOTA CROPS FOR 1928 AND 1913

Crop	1928			1913		
	Acres	Bushels	Value	Acres	Bushels	Value
Corn	4,469,000	93,849,000	\$58,186,000	2,640,000	67,320,000	\$37,699,000
Wheat	3,262,000	34,546,000	29,320,000	3,775,000	33,975,000	24,122,000
Barley	1,644,000	85,675,000	17,121,000	958,000	16,765,000	7,712,000

* Tons instead of bushels

† Given as wheat only, not differentiated into spring and winter.

1910; there were 27,262 farms reported as mortgaged in 1920; 28,813 in 1925. The acreage, production, and value of the principal crops in 1928 were as shown in the accompanying table.

Manufactures. The census of manufactures for 1927 reported 472 manufacturing establishments with 5551 wage earners who received \$6,785,893 in wages and with products valued at \$83,001,103. Butter making was the most important industry with a product valued at \$15,868,381 in 1927.

Education. Educational progress in South Dakota has been persistently carried on. Not only has the number of teachers increased at a more rapid rate than in many States, but large sums were spent in a State-wide building programme for fine rural and city schools. Teaching requirements were considerably raised and general teaching conditions vastly improved. Among the specific accomplishments was the establishment of a high-school division with a director in charge. In 1919 there were only 112 accredited high schools in the State; in 1923 there were 249, with much more rigid requirements. Another feature was the establishment of Americanization work. The total enrollment in the evening schools after the introduction of that work exceeded 3000. Home economics and agricultural courses were established in high schools under the Smith-Hughes Act, and the rehabilitation of disabled civilians was also undertaken. A "better-school drive" in 1919 produced excellent results, including the erection of dozens of fine consolidated schools and hundreds of modern one-teacher schools. The Legislature passed a law providing State aid to consolidated standard and rural schools, and State inspection of rural and consolidated schools was also established. A new compulsory-attendance law was enacted, and legislation provided for State supervision of its enforcement, as a result of which the average attendance per rural pupil enrolled increased from 102 to 127 days per year. The law provided for at least an eight-month term in every school in the State. The total enrollment below the grade of high school in 1912 was 90,389; in 1925-26 it was 138,166. In the high schools in 1925-26, there were 26,385 pupils enrolled. Total expenditures for schools in 1925-26 were current, \$13,504,426; outlays, \$1,624,834. The percentage of illiteracy in the State decreased from 3.7 in 1910 to 2.2 in 1920; in the native white population, it remained at 0.4 per cent; among the foreign-born white, it decreased from 5 to 4.9 per cent, among the colored, from 6.8 to 6.7 per cent.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were, for maintenance and operation of the governmental departments, \$9,110,066 (of which \$1,818,212 was aid to local education); for conducting public-service enterprises, \$543,382; for interest on debt, \$3,104,714; for permanent improvements, \$3,629,526, total, \$16,387,688 (of which \$4,016,341 was for highways, \$1,169,244 being for maintenance and \$2,847,097 for construction). Revenues were \$16,338,291. Of this, property and special taxes formed 30.4 per cent, departmental earnings and charges for officials' services, 7.5 per cent; sales of licenses and taxation of gasoline, 25.5 per cent. Property valuation was \$1,805,466,033; State taxation thereon, \$4,807,950. The net State funded debt on June 30, 1927, was \$15,014,772.

Political and Other Events. The influence of the Nonpartisan League was for a time considerable in the State, although less than in North Dakota. The Republicans in 1914 re-elected Governor Byrne, but Senator Crawford was defeated for reelection by E. S. Johnson, Democrat. In 1916 Peter Norbeck, Republican candidate, was elected governor. For President, in 1916 Hughes received 64,261 votes; Wilson, 59,191. Governor Norbeck was reelected in 1918. In this year, the Nonpartisan League cast over 25,000 votes for a candidate for governor. Thomas Sterling, Republican, was elected to the Senate. In 1920 the Republican candidate for governor, W. H. McMaster, was elected, and Peter Norbeck, former governor, was elected to the Senate. In the presidential voting, Harding received 109,874 votes, Cox, 35,938. T. P. Christiansen, the Farmer-Labor and Nonpartisan candidate for the Presidency, received over 34,000 votes. Governor McMaster was reelected in 1922. The State was seriously affected during this year by a bituminous coal strike and by a strike of railroad shopmen, which continued from July 1 until the autumn. As a result, elevators and granaries were for a long period congested with crops, while the impossibility of moving the crops broke down the market to such an extent that much of the produce was sold at a loss. The vote for President in 1924 was Coolidge, 101,299; LaFollette, 75,355; Davis, 27,214. Carl Gunderson, Republican, was elected governor. He sought to check the rural credit system under which the State had lent over \$40,000,000, but lost the support of his own party. W. J. Bulow, Democrat and supporter of the State's bank guarantee system, was elected governor in 1926. The Rural Credit Board in 1928 reported defaults on \$16,000,000 of its loans and a capital deficit of \$5,344,000, and levied a special tax to meet the situation. Bulow was reelected in 1928; the vote for President was Hoover, 157,603; Smith, 102,660.

Legislation. The Legislature of 1915 passed a bill abolishing the death penalty. The Supreme Court of the State in this year declared the so-called "blue sky" law of the State unconstitutional. In 1917 a budget system was created. A new primary law was enacted and a prohibition law was passed. The Legislature also passed a workmen's-compensation law and amended the banking laws of the State. The Legislature of 1919 passed measures forbidding the display of the red flag. It also passed a measure providing for a land-settlement commission to encourage and to assist former soldiers and sailors to build homes and to own farms. Provision was made in 1921 for the loan of money for urban home building under the Rural Credits Board. Amendments providing for a State bank and State hydroelectric development were submitted to the people, and were defeated in the election of 1922. The Legislature of 1923 passed a measure prohibiting expenditures in excess of appropriations. It also made provision for a constitutional convention, passed a uniform flag act, and enacted a measure to facilitate the cooperative marketing of agricultural products. Departments of Finance and of Agriculture were created in 1925 and regulations were made for an executive budget.

SOUTH DAKOTA, UNIVERSITY OF. A coeducational State institution of higher learning at Vermillion, S. D., founded in 1882. During the period of 1914-28, student enrollment increased from 421 to 1227, the faculty from 50 to 135, and the library from 20,500 to 65,000 volumes. Dur-

ing the same period, the women's building, engineering shops and observatory, the chemistry building, the stadium, and administrative building were completed. Departments in journalism and commerce were opened in 1915. Productive funds amounted to approximately \$500,000 in 1928 and the annual income to \$75,306.02. Robert L. Slagle, Ph.D., LL.D., president, died in 1929.

SOUTH DAKOTA STATE COLLEGE. A coeducational State institution at Brookings, S. D., founded in 1882. The enrollment in the autumn of 1928 was 1214; the faculty numbered 158. Productive funds of the college for 1928 amounted to \$749,268.31. The Coolidge Sylvan Theatre and the Lincoln Memorial Library were dedicated in September, 1927, by President Calvin Coolidge. In 1928 the library contained 35,000 bound volumes and 12,000 pamphlets, President, Charles W. Pugsley, D. Agr.

SOUTHERN CALIFORNIA, UNIVERSITY OF. An institution of higher learning for men and women at Los Angeles, Calif., founded in 1879. The student enrollment increased from 2649 in 1913-14 to 15,084 in 1927-28, including summer-session enrollment and extension classes, the enrollment in the summer session of 1928 being 4948. The teaching staff increased correspondingly from 207 to 500 members, the productive funds from \$412,548 to \$1,200,000, and total yearly income from \$106,766 to \$1,408,777. The school of commerce and business administration was organized in 1920, and in the first three years of its existence increased more than 200 per cent in enrollment; an extension division was organized in 1922, and in the following year, the school of social welfare under the direction of Dr. Emory S. Bogardus. Metropolitan College was organized in 1924, giving educational opportunities to 2680 people. One building of the science unit, for the college of pharmacy and department of chemistry, was erected in 1924, and construction begun on a residence hall for women, which was completed in the following year, when a law building, and a school of architecture building were also under construction; a student-union building was erected on the campus during 1926-27 and Bridge Hall and a new addition to the science building in 1927-28. President, Rufus B. von Kleinsmid, LL.D., Sc.D., J.D.

SOUTH POLE. See POLAR RESEARCH.

SOUTHWEST AFRICA PROTECTORATE. Formerly German Southwest Africa, but since 1920 a mandate territory of the British Empire administered by the Union of South Africa. It has an area of 311,820 square miles, and an estimated native population of 231,790. The European population, according to the 1926 census, was 24,115. The capital, Windhoek, had 4602 Europeans and 10,489 natives. Diamond mining, exploited by British capital, continues the most important activity and was the largest factor in the protectorate's foreign trade. In 1927, 723,877 carats of diamonds, valued at £1,620,862, were produced. Other exports are live stock, copper ore, vanadium, lead, and tin. In 1913, exports were valued at £3,446,220; in 1919, £1,679,534; in 1920, £5,401,385 (of which £4,265,294 was diamonds); in 1927, £3,475,561. Leading imports in 1927 were foodstuffs, apparel, cotton goods, mineral oils, etc. Under the Germans, in 1913, imports were valued at £2,171,230, in 1919 they were valued at £1,135,116; in 1920, £2,180,183; in 1927, £2,490,816. In 1928 there were 1361 miles of railway of 3-foot 6-inch

gauge and 409 miles of 2-foot gauge. The most important port, Walvis Bay, was opened up when the British built a 22-mile line from Walvis Bay to Swakopmund, the western terminus of the territory's most important railway. The Union of South Africa was linked to the protectorate when a line was built for military purposes from Prieska to Kalkfontein.

In October, 1915, after the military forces had occupied the country, a civil administration was established, though martial law was maintained until 1921. Germany, in the Treaty of Versailles, renounced her sovereignty, with the result that Southwest Africa was assigned to the Union of South Africa as a mandate territory in May, 1919. The mandate was approved by the League of Nations Council on Dec. 17, 1920. The governor general delegated his powers to a local administrator who was to be assisted by a nominated council of nine made up of four Germans, four South Africans, and one official. For the fiscal year 1927-28, revenues amounted to £691,190 (in 1917-18 they were £650,000). The principal source of revenue was the tax on diamonds, while £160,000 is paid annually as revenue from customs by the Union Customs Department. The expenditure in 1927-28 was £963,935, including £269,607 loan expenditure. The laws of the Union are gradually being introduced into the country. See GERMAN SOUTHWEST AFRICA.

SOWERBY, LEO (1895-). An American composer, born at Grand Rapids, Mich. He received his entire musical education in Chicago, studying with C. F. Lampert, P. Grainger (piano), E. Delamarter (organ) and A. O. Anderson (composition). In 1918-21 he taught theory at the American Conservatory there, and was also organist at the South Congregational Church and critic for the *Inter-Ocean*. In 1921 he was awarded a special fellowship by the American Academy in Rome, where he spent the following two years. He appeared as soloist in his own works. As a composer, he is a decided futurist, although he himself claims affinity with the neo-classicists (Franck-d'Indy). His works comprise a symphony; a symphonic sketch, *The Sorrow of Mydath*; an overture, *Comes Autumn Time*; *Suite in the Old Style*, *Rhapsody on British Folk-Tunes*; *The Ballad of King Estmere*, for two pianos and orchestra; an orchestral suite, *From the Northland*; a violin concerto, a 'cello concerto, and a piano concerto; a quintet for wind instruments; besides piano pieces and choruses.

SPACE, SPACE-LATTICE. See PHYSICS.

SPA CONFERENCE. See PEACE CONFERENCE AND TREATIES; REPARATIONS.

SPAETH, J(OHN) DUNCAN (ERNST) (1868-). An American philologist. He was born in Philadelphia, Pa., and studied at the University of Pennsylvania and at Leipzig, then in Italy and France. He was professor of English at several colleges and, after 1911, was professor at Princeton. He is author of *Christian Theology in Browning's Poetry* (1916) and *Old English Poetry* (1921); and editor, with Henry S. Pancoast, of *Early English Poetry* (1921). During the World War, he was educational director of two army camps and edited *Camp Reader for American Soldiers*, adopted by the War Department for the American Expeditionary Forces.

SPAIN. A constitutional monarchy of southwestern Europe. Continental Spain has an area of 190,050 square miles; Greater Spain (including the Balearic and Canary Islands and the Spanish possessions in the north and on west coast of Africa) has 194,800 square miles. Population in 1910 was 19,950,817; in 1920, 21,347,335; in 1927 (estimated), 22,444,156; average annual increase, 0.65 per cent. The density of population in 1920 was 109.5 per square mile; maximum density in Province of Biscay, 490.1 per square mile, minimum density in Province of Soria, 38 per square mile. In 1927 it was estimated at 115.2 per square mile. Principal cities with population in 1927 were: Madrid, 808,366; Barcelona, 760,348; Valencia, 267,346; Seville, 215,107; Malaga, 158,733; Saragossa, 153,681; Murcia, 152,945. The movement of population in 1926 was: births, 657,229; deaths, 421,762; marriages, 159,848. Emigration, after the World War, took on large proportions once more, 101,980 Spaniards quitting the country in 1919; 185,918 in 1920; 92,504 in 1921; 93,591 in 1922, and 76,883 in 1927, as compared with 129,576 in 1914. Their destinations were for the most part the Argentine, Cuba, Brazil, Uruguay, and Mexico. It should be noted, however, that these emigrations were largely seasonal, covering the period of the harvest only, and that most of the emigrants returned immediately after. In 1920, 45.46 per cent of the population was illiterate. Education in the primary grades has made slow progress, though institutions for higher education are fairly well attended. On Jan. 1, 1926, there were 28,870 primary schools in Spain. In 1929, 60 secondary schools had 74,273 pupils, and the 11 universities in the country with the university section of Canary Islands, 31,562 students. In 1927 the total expenditure on education and the fine arts was 166,141,510 pesetas, as compared with 62,584,378 in 1914.

Industry. Agriculture is the mainstay of the country. Areas under cereal crops have increased little: wheat, 9,676,879 acres in 1914 and 10,566,985 in 1928; rye, 1,886,206 in 1914 and 1,839,770 in 1928; barley, 3,402,553 and 4,447,657. The acreage under vines remained about the same (3,452,670 in 1927), though production in gallons was 748,351,573 in 1927 to 432,617,000 in 1913. Similarly, the production of olive oil was 265,422 tons in 1913 and 230,112 metric tons in 1923. Other important products are rice, beans, peas, lentils, tares, vetches, flax, hemp, pulse, esparto, oranges, hazelnuts, onions, almonds.

The sugar industry received some attention, there being 26 cane-sugar factories and 48 beet-sugar factories in 1929. In 1913, 13,231 metric tons of cane sugar were produced, as compared with 8704 tons in 1926. Production of beet sugar was 95,986 tons in 1927. Pastoral activities are once more on the increase, sheep increasing in number from 14,500,000 in 1913 to 20,067,000 in 1925; goats, 3,394,000 to 4,749,000; horses, 540,000 to 697,678, mules and asses, 1,824,000 to 2,363,737, cattle, 2,878,000 to 3,794,000; hogs, 2,750,000 to 5,267,000. Some 505 factories prepare sardines and preserved fish for the home and export markets. During the World War, interest in mining was stimulated, but except for coal, soon flagged. All the principal minerals in 1926 showed smaller yields than those of 1912. Iron dropped from 9,139,000 tons to 3,195,019 tons in 1926. Total values of mineral products at the mine mouths were, for typical years. 1910, 453,-

000,000 pesetas; 1917, 1,323,000,000; 1927, 416,902,801. The War had a heightening influence on the manufactures of the country, which, because of the dearth of capital and Spain's inexperience, was also only temporary. There were 2,614,500 spindles in the cotton establishments in 1910 and only 2,000,000 in 1923; 274,800 spindles in the wool factories in 1923, as compared with 662,000 in 1910. Cork and paper production have increased slightly.

Trade. The years 1913 and 1914 saw an excess of imports over exports, but with the beginning of the war period and the heavy demands made on Spain for her products, the balance turned favorable and continued so through 1919. From thence on, imports once more exceeded exports. The figures for typical years in thousands of dollars at the prevailing rates of exchange are (excluding treasure)

	1913	1918	1921	1927
Imports	252,067	109,773	382,449	502,625
Exports	204,123	170,626	211,488	378,442

In July, 1929, a continued unfavorable balance of trade caused the Government to grant a state subsidy to grain producers and to announce the adoption of proposed enactment of decrees protecting and stimulating Spanish industries and exports. A general tariff revision, by which the importation of certain foreign merchandise would be restricted, was to be effected Oct. 1, 1929. Leading exports are, of course, alimentary substances, including grain, sugar, and wine, metals and their manufactures, wool, timber, and cotton. Imports are machinery, drugs, metals, foodstuffs, etc. In 1927 exports to the United States were valued at 211,958,000 pesetas and imports from the United States at 512,540,000 pesetas. In 1914, 18,915 vessels of 22,229,159 tons entered and 16,482 of 19,265,265 tons cleared Spanish ports. In 1918 the figures were entered, 12,475 of 6,745,084 tons, cleared, 13,936 of 7,204,843 tons. In 1926 entered, 18,820 of 24,804,418 tons; cleared, 16,317 of 21,342,118 tons. The Spanish merchant marine consisted of 628 steamers of 844,322 tons and 236 sailing vessels of 32,000 tons in 1914, in 1927 there were 1763 steamers of 1,232,805 tons and 529 sailing vessels of 83,585 tons. There was therefore a substantial increase in spite of the war losses by submarine and mine.

Railways. In 1913 total length of railways open was 9310 miles; in 1927, 10,010 miles. The railway service was severely taxed during the World War because of the increased traffic caused by the cessation of the coasting trade. The continued depreciation of equipment, the higher wages, and only the slight rate increase of 15 per cent allowed, put the railroads in a sorry condition. It was incumbent on the Government to increase annually the state subsidies, so that 6,950,343 pesetas had to be paid over during 1925. In 1929 the railways were preparing to electrify 1372 miles of road, including the widening of some narrow-gauge line and the construction of two hydroelectric plants. In 1919 the first Spanish subway, that of the Madrid tubes covering a length of 3 miles, was opened.

Finance and Economic Conditions. The revenue in 1914 was 1,343,000,000 pesetas and the expenditure, 1,430,000,000. By 1925-26 the revenue had mounted to 3,335,790,000 pesetas (exclusive of loans) and the expenditure, to 3,525,081,000. Estimates for 1929 were: expenditure, 3,370,104,000 pesetas, and revenue, 3,399,-

770,000. The total funded public debt on Mar. 31, 1929, was 19,272,742,000 pesetas, of which 5,261,406,000 pesetas was internal. In 1914 there were 1,885,847,000 paper notes in circulation; by December, 1927, these had increased to 4,202,000,000. However, the metallic reserves of the Bank of Spain were 2,604,000,000 pesetas. The period of the War saw a quickening of interest in internal affairs and an increased prosperity. Many joint-stock companies, particularly during 1916-17, were formed for industrial enterprises and the Government aided by the creation of a commission for the promotion of industry. Also, the external loan placed abroad was taken up by Spaniards, so that the great majority of the bonds were held at home. The application to the domestic coal fields saw a doubling of pre-war production in anthracite and lignite, and though the coal was of an inferior quality, it served very well for the use of the electrified railways which were being extended. The demands for raw materials and foodstuffs from belligerents caused home stringencies and necessitated strict governmental regulation. From 1914 on, the Government applied itself to the regulation of cereal exports, the control of domestic prices, the removal of import duties from foodstuffs, the stimulation of agriculture by bounties, etc. In 1917 a general agricultural law was passed for the encouragement of the industry through the creation of a central agricultural loan bank. In 1918, after the failure of local boards of supply to control the traffic in provisions adequately, full powers were given to a commissary general. The rise of prices, the growing intransigency of labor, profiteering, etc., all contributed to a general industrial unrest that took on a revolutionary character and prepared the way for the *coup d'état* of General Primo de Rivera.

History. The outbreak of the World War divided Spanish opinion into two groups: the pro-French Spaniards, who were largely liberal in their tendencies, as well as anti-monarchical and anti-clerical; and the conservatives, who, because of French expansion in Morocco and the separation of Church and State in France, were pro-German in their sympathies. This cleavage and the fact that Spain could hardly gain anything from war led to the decision to remain neutral. The Cortes, meeting in October, 1914, endorsed the general policy, with the result that the country settled down, first to a state of uncertainty because of the fear of suspended food imports, and then to one of complacency as orders for materials began to pour in from France. A steady stream of metals, clothing, and pack-animals, crossing the frontier during the whole period 1914-18, brought in return, increased prosperity to certain classes. Shipbuilding flourished as well as trading with Allied ports. Naturally, many vessels were lost by torpedoing and mines. In 1915 the Dato ministry, in power since 1913, was succeeded by a cabinet made up of the liberal elements headed by Count Romanones. The new Government was generally characterized by a pro-Allied attitude, although it took no active steps to lead Germany to a war declaration. On Apr. 20, 1917, Count Romanones resigned, to be followed by Garcia Prieto, leader of another wing of the Liberals, who was more nearly neutral in his tone. The Liberal stay in power was, however, very brief. The demands for a more aggressive policy toward Germany, because of the intensification of its submarine campaign, and the unsuccessful attempt of the Spanish govern-

ment to cause the dissolution of the military juntas which had rapidly spread among the infantry officers, hastened the crisis.

In June, 1917, Dato (Conservative) was once more called to head a cabinet, and he immediately acceded to the revolutionary demands of the military cliques. Their agitation, fed by the inefficiency of the bureaucracy, was to culminate in the events of 1923. Three movements were to march side by side in the subsequent years: the increasing distemper of the laboring classes, manifesting itself in industrial struggles of growing bitterness; the larger part in affairs that the military juntas assumed; and the regionalist movement, centring in Catalonia, whose purpose was a greater measure of local autonomy. From all this agitation, it was to be expected that the parties of the Left should adopt an uncompromising attitude. An extensive programme was announced, including greater decentralization, popular election of senators, elimination of the right of the Government to suspend the constitutional guarantees and to prorogue Parliament at will, annual meetings of Parliament, etc.

Labor troubles were frequent throughout 1917, and the demands of the Catalans took on more insistency. Most of the Catalan members of the Cortes met in an assembly at Barcelona on July 19, 1917, to press for reforms. The general strike that followed (July-August) and the forced resignation of the War Minister as a result of the intrigues of the military committee hastened the fall of the Government. Prieto again formed a cabinet of Maurists (extreme Conservatives), Liberals, and Catalanists. A general election took place early in 1918, the Government fell at the first meeting of the Cortes on March 18. The highhanded conduct of the War Department under La Cierva had precipitated the crisis. Only through the personal influence of the King could a new cabinet be formed. This was made up of the strongest men in public affairs, including Mauro, Dato, and Romanones, but it, too, fell (November 6). It was followed by a short-lived Prieto ministry which in turn was succeeded by a Romanones government on December 3.

The end of the War and the popularity of the democratic doctrines which reverberated around the world were reechoed in Spain. The Ministry of Public Works announced an extensive programme of economic reconstruction. In December, 1918, a Catalan parliamentary delegation issued a manifesto demanding home rule. A general strike broke out in Barcelona early in 1919, hastened by syndicalist propaganda. The attempt to mobilize the strikers on the one hand, and the desire to propitiate them, on the other, by the appointment of liberal civil authorities at Barcelona, brought the civil and military officials into conflict. The Government therefore resigned and a cabinet formed by Maura (Apr. 15, 1919) effected a dissolution of the Cortes and a new general election; but Maura was compelled to retire soon after, and the following ministries could maintain only a brief tenure. The machinations of the juntas and the continued industrial conflicts made any permanent civil government an impossibility.

In November, 1919, the Spanish Employers' Association threatened a nation-wide lockout if the Government did not treat both the employers and the workmen more fairly. By January, 1920, a reign of terrorism prevailed. In April, 1920, Dato once more headed a ministry. His attempt to conciliate the extreme conservatives of his

party, i.e., Maura and La Cierva, and the Liberals, by a programme of social reform including arbitration, insurance, and land measures, was unavailing, for as a result of the December elections, he was left without a majority in the Cortes. His endeavors to reconcile all Conservative elements were occupying him when he was assassinated on Mar. 8, 1921.

From 1921 on, the conduct of the war in Morocco became the leading question in Spain. The increasing taxation, the intolerable censorship, and the rumors of Moroccan disasters served to antagonize further all classes of opinion against the ruling political leaders. The Maura ministry, embarrassed by the juntas in its handling of the Moroccan War, attempted to force their dissolution and was compelled to resign when the King refused to sign the decree (Jan. 11, 1922). Maura was called back, to last only another two months, and was followed by a Liberal coalition under Guerra. The latter immediately became popular by restoring the constitutional guarantees, suspended three years earlier, and by moving against the military juntas. On Nov. 14, 1922, a decree was promulgated, ordering their abolition. A prolonged discussion over the responsibility for the disasters of 1921 in Morocco, an attempt to impeach the Allende-Salazar ministry under which they had taken place, and demands for such reform of the constitution as would end the suspension of the guarantees, caused the overthrow of the ministry. After great difficulty, a new Liberal government was formed under Prieto on December 7. In December, a sensation was caused when the former High Commissioner of Morocco, General Berenguer, assumed full responsibility and demanded a trial in order that the whole matter might be aired. His charges of inefficient equipment and a general lack of foresight on the part of the administration stirred a country which had already been aroused over the great loss of life and the expenditure of 500,000,000 pesetas. By the middle of 1923, parliamentary commissions investigating the conduct of the campaign were prepared to bring charges against the ministry and the high officers in command, as concessions to public opinion.

A parliamentary commission, the Committee of Twenty-One, under the chairmanship of General Picasso, was appointed to investigate the conduct of the administration. In the summer of 1922, this committee rendered the Picasso Report to the Council of Ministers, recommending death penalties for several generals and ministers, and suggesting a number of governmental reforms. The Report was suppressed and fear of a *coup d'état* led the Government to prorogue the Cortes.

From Mar. 22, 1918, to Sept. 13, 1923, 12 cabinets rose and fell. In the year ending September, 1923, strikes, riots, and reprisals in the Province of Barcelona alone resulted in the death of 337 workmen and employers. Catalan agitation increased with every passing year. On top of all this came the example of Mussolini's successful dictatorship in Italy. The time for a military coup was therefore at hand as the year 1923 drew to a close. On September 13, Captain General Ferdinand Primo de Rivera, Military Governor of Barcelona, seized the civil administration of the city, and then proceeded to oust the entire ministry. It was evident at once that the revolution was not directed against the throne but against the prevailing political methods.

It eventually appeared that the coup was carried out in conjunction with the Crown. When

the King arrived in Madrid shortly after the coup, he requested General Rivera to put himself at the head of a military directorate and form a government. Parliament was dissolved by decree on September 16; the ministerial departments were placed under the permanent under-secretaries; trial by jury was suspended, and a strict censorship imposed. The military directorate headed by General Rivera and made up of Generals Adolfo Espasno, Luis Navarro, Luis Hermoso, Dalmacio Rodriguez, Antonio Mayenda, Gomez Jordana, Ruiz Portal, and Mario Muslera, with Admiral Marquis Mavez, exercised the real functions of government. First measures were characteristically severe. All local officials were dismissed and new elections ordered. Decrees were promulgated abolishing the salaries of life senators, amending judicial procedure, and establishing a commission for the review of railway administrative methods. The support of the middle classes was demanded under a veiled threat of compulsion. The result was the oversubscription on November 5 of 350,000,000 pesetas of treasury bonds. That the dictatorship did not contemplate a brief stay in power was indicated when Count Romanones and Don Alvarez, speakers, respectively, of the Senate and the late Chamber of Deputies, were removed from their posts for petitioning the King to convoke the new Cortes. The lot of the dictatorship was not an easy one. Hostility was evoked by the dissolution of the provincial legislatures, the exile of the popular Professor Unamuno to the Canary Islands, and the failure of the directorate to cope with the repeated Moroccan disasters, for Rivera was no more successful than had been his predecessors in fighting the Riff tribesmen.

Early in 1925, the novelist Blasco de Ibañez assailed the dictatorship through an attack on the King. Ibañez strewed his pamphlets over a number of towns from airplanes. It was the censorship, in particular, which made him and many other intellectuals impatient with the system. By way of removing some of the people's grievances, the Government, on May 17, 1925, abolished the martial law which had been in force since Sept. 15, 1923. On Aug. 20, 1925, a royal decree provided for an annual subsidy of 10,000,000 pesetas for shipping, and of 8,000,000 in addition for shipbuilding. Finally, on December 3, the military directorate was superseded by a civil government, still under Rivera's presidency, but composed of a number of civilians, as well as generals. All its members belonged to the new political party which Rivera had formed, the Union Patriótica. Despite all this, however, there was a serious revolt in the artillery corps in 1926, because of the Government's policy of promoting men by favoritism rather than by seniority.

In June, 1926, there was also another of the many attempts to assassinate Rivera. The latter now proceeded to exercise his control over the press to such an extent that it reported Spanish victories in Morocco at the very time Abd-el-Krim was winning his greatest battles. As a further bait to Nationalists, Rivera, on Sept. 11, 1926, gave the required notice that Spain would withdraw from the League of Nations in two years, because her demand for a permanent seat in the Council was refused. Perhaps because of these shams, and also because of a policy of intimidation adopted by the Government (martial law was reestablished Sept. 5, 1926), a plebiscite of Sept. 11, 12, and 13, 1926,

upheld the dictatorship by a majority of several millions, the total votes cast in its favor being reported as 6,989,043. Rivera's popularity increased still further when, on July 12, 1927, Spanish Morocco was again "pacified," with the invaluable aid of the French. Spain had spent \$800,000,000 in Morocco in 18 years, and for a decade the average annual loss of lives had been 13,000 soldiers.

Martial law was again done away with, on Jan. 1, 1927, and on September 12, a National Advisory Assembly was convoked to sit in place of the Parliament that had been dissolved on Sept. 16, 1923. This Advisory Assembly met for the first time on Oct. 10, 1927. The make-up of the Advisory Assembly, as modified by a royal decree of Dec. 5, 1928, was 400 members, nominated directly or indirectly by the Government, and holding office for three years. The general electorate, every man and woman of 23 or over, could only vote in some local elections and in special plebiscites. Moreover, as its name indicated, the Advisory Assembly had no real legislative powers, its sole functions being consultative. In 1928 the Assembly was directed to draft a new constitution to supersede the one of 1876 which was still in force—at least theoretically. On July 5, 1929, debates on a tentative draft, embodying the idea of a corporate state, were begun.

With the close of 1928, it seemed as though the Dictator might be in undisputed control. Even the Unión General de Trabajadores (National Labor (Confederation) supported him, since several labor leaders had been given public service positions, but on Jan. 29, 1929, another revolt broke out in the artillery corps, in Ciudad Real, over the questions of unfair advancement and the restoration of the constitutional monarchy. As a result, the corps was dissolved and the leader of the revolt, ex-Minister Sanchez Guerra, imprisoned on a war ship. The artillery schools were closed, too, but the parents of children whose careers were thus ended were subsidized by the Government. Before long, however, the corps was ordered reestablished, and most of the schools reopened.

On March 9, a general strike of university students broke out because of the alleged favored treatment accorded some of the students of the closed artillery school at Segovia, to the disadvantage of the engineering students at Madrid. The Government proceeded to close five universities and dismissed many of the professors. Although most of the schools were again opened in short order, a decree of March 16 closed the University of Madrid until Oct. 30, 1930, because of a street fight between students and police. Soon the same decree was applied to the universities at Valladolid and Salamanca because the students there had gone on sympathy strikes for their Madrid colleagues. On May 29, 1929, however, all universities were reopened.

Despite this prevalence of disorders and revolts, Rivera announced his determination to continue in control. On Mar. 6, 1929, he had declared, however, that if he were living in March, 1931, he would then be ready to abandon his functions. By that time, he felt the country would be in a "proper state for the best citizens to maintain the upper hand over the politicians." In April, 1929, nearly every important bank, business firm, and industry was reported to have signed a statement pledging adherence to the Dictator's régime.

Catalan Question. The Catalan question, which had agitated Spain to a greater or lesser degree for 50 years, came to a head, as indicated above, in the years 1917-19. It embraced two aspects: a weak separatist movement for independence, and a stronger and more popular movement for regionalism or home rule. At first, purely sentimental and literary, the movement for home rule had taken on a political and economic character. The Catalan language was revived, and the particularistic tone of the agitation became more pronounced. An assembly met in Barcelona in 1917 in defiance of the Government and voted resolutions asking for drastic reforms in the constitution. In spite of the arrest of the members attending, the agitation continued. In 1918 a parliamentary delegation of Catalans presented to the government a full statement of demands. This included delimitation of Catalan territory, to take in the existing four Catalan provinces, definition of the respective limits of the powers of the central government and those of the Catalan and the calling of a Catalan constituent assembly, political, economic, and financial autonomy through the organization of a Catalan government with two chambers, regional control of taxes on mines, forests, railways, and water courses; a court of arbitration for the settlement of disputes between the central and regional authorities. An attempt was made to place this manifesto before President Wilson and the Peace Conference, but the nationwide hostility which it aroused, together with the threats of the military to apply force and of the middle class to declare an economic boycott, softened the ardor of the intransigents. Incidentally, a large mass of the supporters of the movement fell away when the workers lost interest and became absorbed in the trade-union movement. Yet the undercurrent continued to be felt from time to time. From 1921 to 1924, it appeared from the disorders and propaganda prevalent that the movement had lost none of its vitality. Even the decree of Sept. 18, 1923, which inveighed against regionalism had no real effect.

Naturally, the flamboyant nationalism which the dictatorship represented did not look kindly upon the movement. The Catalans, moreover, were openly hostile to the directorate, going so far, in April, 1924, as to appeal to the League of Nations for intervention. In 1925 there were two attempts to assassinate Rivera and one to blow up a royal train near Barcelona. All three of these attempts were traced to Catalan influences. Then, on Nov. 2, 1926, by arresting several Catalan leaders, the French police frustrated a Separatist plot to set up an independent Catalonia by an invasion from across the French border. Rivera managed to secure the support of the manufacturing interests of the Catalan provinces for a while when he suppressed the Catalan labor movement and pronounced himself in favor of a high tariff, but by 1928 and 1929, this group, too, was dissatisfied with the Dictator's attacks upon Catalan cultural sentiments and with his failure to grant them any further concessions. On Sept. 13, 1928, a plot to overthrow the Dictator was uncovered in Barcelona. Effective repressive methods prevented much vocal propaganda, but in 1929 both separatism and regionalism were stronger than ever.

Foreign Affairs. Domestic concerns during 1914-18 distracted attention from foreign affairs. The result was that the tone of the nego-

tiations carried on with Germany over submarine sinkings never became obstreperous. In 1918 an agreement was reached with Germany for a ton-for-ton indemnity to cover all losses. In 1919 Count Romanones attended the Peace Conference and succeeded in obtaining for Spain a place in the Council of the League of Nations. All talk of a Franco-Spanish alliance, which was current rumor in 1919-20 and was quickened by Count Romanones's presence at the Peace Conference and the King's visit to Paris in 1919, came to naught because of the Spanish pretensions in Tangiers. Spain's desire to assume an important place in foreign affairs and in the Mediterranean in particular was not to be frustrated, for with the assumption of the reins of government by the Directorate, *pourparlers* were at once commenced with Italy. In November, 1923, the King and Queen, accompanied by General Rivera, were entertained by Italian royalty. A commercial treaty was at once effected, and it appeared certain that Mussolini and Rivera meant to hasten a rapprochement of the two Powers for the maintenance of an equilibrium in the Mediterranean.

Meanwhile, negotiations were under way for commercial treaties with France, Germany, Switzerland, Portugal, and the United States. Considerable hard feeling was engendered by the fact that France in 1920 increased all tariffs considerably. The matter was debated in 1921-22 and seemed on the way to solution in 1923, when the Government was authorized to negotiate a treaty, but the *coup d'état* ended all discussions for the time. The same was true of the German and United States treaties which lapsed in 1922 and 1923, respectively. The Dictator's economic nationalism made it difficult for him to come to satisfactory terms with a number of the Powers. High tariffs and retaliatory measures embittered relations. In one case, when Germany made the importation of Spanish grapes prohibitive, several Spanish provinces suffered severely; but by 1927 agreements had been reached with nearly all countries. Then, on May 1, 1927, the American Chamber of Commerce in Spain protested that recent modifications of the Spanish commercial treaties with Great Britain and France virtually removed the United States from the class of most-favored nations. It was not long, however, before a compromise agreement was attained.

On July 13, 1926, a Franco-Spanish agreement over Morocco was signed, and exactly seven days later, the Spanish Cabinet ratified an agreement permitting the United States to search Spanish vessels for contraband liquor within one hour's steaming distance of the American coast. Aug. 7, 1926, saw the signing of an Italo-Spanish Treaty of Friendship and Conciliation in which each party undertook to remain neutral in case the other were attacked by a third party. This was generally taken to mean that Spain and Italy were adopting a common policy in the Mediterranean, to the possible disadvantage of France. Among the arbitration treaties signed by Spain were one with Chile on May, 1927; one with Belgium on July 17, 1927; and one with Sweden on Apr. 27, 1928. On Mar. 22, 1928, Spain announced her desire to remain in the League of Nations. On July 10, 1929, a treaty of arbitration of commercial disputes was signed with France. In 1929 King Alfonso opened two Spanish world expositions, one at Barcelona, and one at Seville.

SPANISH LITERATURE. Spanish literature in the nineteenth century had a veritable renaissance in the drama, the novel, and in lyric poetry, three fields in which Spain had been supreme in the heyday of her Golden Age. To these, she added an excellent school of criticism. In all four of these forms of literary activity, Spain has continued to shine thus far in the twentieth century. The "generation of 1898" was the name applied to the forward-looking group which, while preserving all that was best in their native inheritance, wished to profit by all that was best beyond the borders of their own land. Keen observers saw the lessons to be learned from foreign experience, and patriotic hearts and minds adapted those lessons to the native needs, so that Spanish literature of the twentieth century has been racially Spanish and typical.

In the novel, two old favorites went into new fields. Blasco Ibáñez (died 1928) wrote a series of novels about the War, one of which, *Los Cuatro Ginetes del Apocalipsis*, is remarkable for its grasp of the extent of the racial problems involved; and Pio Baroja wrote a series of novels that tend to show the development of liberal ideas in Spain in the nineteenth century. These have been compared, *mutatis mutandis*, with the *Episodios Nacionales* of Pérez Galdós.

The novel appears in several attractive fields—the historical novel, the regional novel, the realistic novel, the latter sometimes showing keen analysis of modern problems. Ramón Maífa del Valle-Inclán wrote about 30 *cuentos*, and three historical novels dealing with the Carlist War in Galicia. Alejandro Pérez Lugín (died 1926) made a great furor with his *La Casa de la Troya* (Fastenrath Prize), which portrays the life of Santiago de Compostela. His subsequent novels, *Currito de la Cruz* and *La Corredorera y la Rúa*, also deal with Galicia, as do those of Francisco Camba, whose *Revolución de Laiño* won the Fastenrath Prize (1922). Mauricio López Roberts won the Fastenrath Prize (1917) with his *El Verdadero Hogar*; his *El Ave Blanca* (1922) deals attractively with a strange Basque legend. Guillermo Díaz-Caneja won the Fastenrath Prize (1918) with his *El Sobre en Blanco*, while his later novel, *La Virgen Palca*, was considered his most beautiful work up to that time. Without intending to be so, he is a moralist. The Puyo Prize (1922) was awarded to M. D. Benavides, whose *Lamentación* revealed a young author of great promise. Ricardo León was esteemed by many as being stylistically the author most nearly entitled to be considered the successor of Juan Valera. In subject matter and in manner of treatment, he continued the traditions of Alarcón and Pereda. His *El Amor de los Amores* is a kind of reversal of *Pepeña Jiménez*. Among his latest novels are *Amor de Caridad*, *Cuentos de Antaño y de Hogaño*, *Humos de Rey*, *El hombre nuevo* (a real event in 1925), and *Juaya* (1928). Beatriz Galindo (Sra. Isabel O. de Palencia) wrote one of the most effective books of the year 1923, *El Sembrador Sembró su Semilla . . .*, a fascinating novel and a medically sound study of eugenics. Concha Espina de la Serna, after winning the Fastenrath Prize for 1914 with her *La Esfinge Maragata*, was forging rapidly to the front, with *La Rosa de los Vientos*, *Ruecas de Marfil*, *El Metal de los Muertos*, *Despertar para Morir*, *Dulce Nombre*,

El Caliz Rojo, *Altar mayor*, and *Las niñas desaparecidas* (1927). In 1923 the Royal Spanish Academy awarded her the Castillo de Chirel Prize for her *Tierras del Aquilón*, and she was already being spoken of for the Nobel Prize. Azorín's *Doña Inés* (1925) is meritorious; and Palacio Valdés's *Cármenes de Granada* (1928) immediately exhausted a first edition of 20,000 copies.

During the period under consideration, poetry gave us not only the editions of the complete works of such poets as José María Gabriel y Galán, Vicente Medina, and Antonio Machado y Ruiz, but new works of very real worth and inspiration, which drink deep from the fountain of the national life. Francisco Villaespesa gave us *Andalucía*, *La Maja de Goya*, and *Paz*. J. M. Bello's *Cantigas de Juglaría* exhibits a surprising variety of rhymes and meters, and the polished verse and beautiful thoughts of E. Carballo's *Cançonero de Amor* met with favor. The *Ruta de Ensueño* (1917) of F. Pérez Menéndez Maturana was deemed better than any of his previous work. The *Poemas* (1918) of A. Torre-Ruiz caused him to be hailed as a new poet of real inspiration. Juan de Contreras, Marqués de Lozoya, showed himself to be a graceful versifier with a real inspiration in *Poemas de Añoranzas* (1915), *Sonetos Espirituales* (1918), and *Poemas Castellanos* (1920), the last of which, treating of Segovian legends, won the Fastenrath Prize. The great poetic event of 1922 was the discovery of a real poet in the person of an authentic shepherd of Castile, Julián Sánchez Prieto, whose book *En el Chozo* was written in the fields among his sheep. The outstanding poetic event of 1927 was E. Marquina's writing of the poem for the national hymn which is to be sung to the *Marcha Real*.

The drama flourished as one would expect, and some of the best work was done in verse, verse whose charm yields in no respect to the verse of earlier periods. Francisco Villaespesa produced *La Leona de Castilla* (1915), *Abcnhimeya*, *El Rey Galaor*, *La Maja de Goya*, and *Judith*, the last a Biblical subject which has been fairly popular in Spanish literature. Eduardo Marquina gave us *El Gran Capitán*, *La Morisca*, *La Extraña* (1921), *El Paro Real* (the most beautiful production of the year 1922, and dealing with an exquisitely dainty legend of British India), *Una Noche de Verano en Venecia* (1923), a happy combination of profound love and sound thinking, set to verse that needs no musical accompaniment; *Don Luis Mejía* (1925, a play in verse, written in collaboration with Hernández Catá), *Fruto bendito*, and especially *La crmita, la fuente y el río* (both 1927). Antonio Rey Soto, a churchman, ranks well as a poetic dramatist, as shown by his *Amor que vence al Amor* (1917) and his mystic tragedy *Cuento del Lar* (1918). Next to Eduardo Marquina, the most graceful dramatic poet probably is Luis Fernández Ardavin, whose works *La Dama del Armario* (1921), *El Doncel Romántico* (1922), *Romance de Doña Blanca* (1923), *El desco*, and *La nave sin timón* (both 1925), were all very well received. In the nonpoetic drama, there is also much excellent work to record. Despite his great age, Benito Pérez Galdós (died 1920) won a triumph with his tragi-comedy, *Santa Juana de Castilla* (1918), as had the almost equally aged Catalan dramatist, Angel Guimerá, with his peace play, *Jesús que Vuelve* in 1917. Julián Sánchez Prieto (see above) had a riotous success with *Al escampero!* (1926); and Ignacio Sánchez Mejías

(a beginner of great promise) gave the clearest note of originality for the year 1928 with *Sinrazón*.

The Alvarez Quintero brothers have continued to keep the Spanish stage supplied with their clean, witty, light comedies and with occasional pieces of a more serious nature, such as *Malva loca* (crowned by the Academy), *La Calumnada*, *Ramo de Lorura*, *La Prisa*, and *Cristalina*, all of which, without losing any of the usual charm of the authors, deal with serious questions. Two other authors of note belong to this lighter school, Carlos Arniches (whose *La Tragedia de Marichu* and *La Mala Hora* were very successful) and Pedro Muñoz Seca, who keeps his public in gales of laughter by his unexpected quips and flashes of repartee (for example, in *El Conflicto de Mercedes*), but who can also write for children, as shown by his engaging *La Muerte del Dragón*.

There still remain four great names connected with the drama of the twentieth century: Jacinto Benavente, from the nature of his work, has been called the Spanish Shakespeare. After 1916 (when he produced *La Ciudad Alegre y Confiada*, which is an exquisite allegory treating the question of national civic preparedness, as against personal selfishness), he gave us *La Inmaculada de Dolores*, *Mefistófela*, *Los Cachorros*, *La Ley de los Hijos*, *La Vestal de Occidente*, and *Por ser con Todos Leal ser para Todos Traidor*. He was awarded the Nobel Prize for 1922. Later successes were *Los nuevos yernos* (1925); *La Mariposa que voló sobre el mar* (1926); and *El demonio fué antes ángel* (1928). Manuel Linares Rivas won a succession of triumphs with his careful studies of vital problems—*Cobardías* (1918, attacking all kinds of moral cowardice), *El Caballero Lobo* (1919), *Álmas Brujas*, *Lo Pasado, Como Dios nos Hizo*, *Frente a la Vida* (problem of educating middle-class girls to economic efficiency, so as to avoid necessity of loveless marriages), and his success of 1923, *La Mala Ley*, which is a piercing study of a bad inheritance law. In the later years, Gregorio Martínez Sierra was devoting a great deal of his time and talent (and he was ably seconded therein by his talented wife) to staging with exquisite taste the plays of others (e.g. *El Paro Real* and *Una Noche de Verano en Venecia*, by Marquina, and *El Conflicto de Mercedes*, by Muñoz Seca); but that did not prevent him from doing some creative work, such as *El Corazón Ciego*, *Don Juan de España* (a new treatment of an old legend), and *El Grillo del Hogar*, which is a dramatization, with delicate touches, of Dickens's *Cricket on the Hearth*. J. López Pimillos, who wrote under the pen name of "Parmeno," worked indefatigably during his last years, as witness *Los Senderos del Mal*, and *Esclavitud* (Piquer Prize for 1918), *El Condenado*, *La Red* (1919, Academy Prize in 1921), *Como el Humo*, *La Tierra*, and *El Caudal de los Hijos* (all produced in 1921, all handling serious problems and the last one treating honor as a spiritual inheritance that parents must hand down unsullied to their children); he died in 1922, leaving behind him two works for posthumous production. *Los Malcasados* and *Embrujamiento*, which latter was a tremendous success.

The school of criticism following in the footsteps of Clarín, Menéndez y Pelayo, and Valera shows such names as Azorín, Blanca de los Ríos de Lampérez, Carmen de Burgos, E. Díez Canedo, Miguel de Unamuno, Ramón Pérez de Ayala, Ricardo León, Luis Astrana Marín, and the

two special followers of Menéndez y Pelayo: Ramón Menéndez Pidal and Adolfo Bonilla y San Martín (died 1926), each of whom has in turn developed a following.

SPARTACISTS. See COMMUNISM; GERMAN.

SPAULDING, EDWARD GLEASON (1873–) An American philosopher, born at Burlington, Vt., and educated at the University of Vermont and at Bonn in Germany. He taught philosophy in the College of the City of New York from 1900 to 1914 when he became professor of philosophy at Princeton University. For several years, he lectured at Woods Hole, Mass. He collaborated with six others in *The New Realism* (1912) also wrote *The New Rationalism* in (1918), and *What Am I?*, essays (1928). He served in the Engineers and the Chemical Warfare Service of the U. S. Army during the World War.

SPECTROHELIOGRAPH. See ASTRONOMY.

SPECTROSCOPY. See ASTRONOMY; PHYSICS.

SPENCER, ARTHUR COE (1871–). An American geologist, born at Carmel, N. Y. He studied at the Case School of Applied Science, and in 1896 received his Ph.D. at Johns Hopkins. Later, entering the service of the United States Geological Survey as assistant geologist, he attained the rank of geologist in 1902. He studied the general geology and ore deposits of Virginia, Colorado, Wyoming, Alaska, and Cuba, and more particularly the zinc and iron deposits in the pre-Cambrian rocks of New Jersey, as well as those of Texas, including the iron ores, and the Triassic iron ores of Pennsylvania.

SPENCER, ROBERT (1879–). An American landscape painter, born at Harvard, Nebr., and trained at the National Academy of Design school in New York and at the New York School of Art. He studied under Chase, DuMond, Henri, Garber, Francis Jones, and F. Luis Mora. Among his numerous awards were the George Innes Gold Medal of the National Academy of Design (1914), the gold medal of the Boston Art Club (1915), the gold medal of the Panama-Pacific Exposition (1915), and the second Altman Prize, National Academy of Design (1920 and 1921). His paintings are permanently hung in the Metropolitan Museum of Art in New York City and in the most important collections of the United States, including those of Chicago, Washington, Pittsburgh, Detroit, and Buffalo. He became a National Academician in 1920.

SPENDER, JOHN ALFRED (1862–). A British journalist and author, who was born at Bath and educated at Bath College and Balliol College, Oxford. He edited the *Eastern Morning News* at Hull from 1886 to 1890, when he joined the staff of the *Pall Mall Gazette*, later going to the *Westminster Gazette* of which he was editor from 1896 to 1922. He was a member of the special mission to Egypt in 1919–20, and visited the United States, where he delivered lectures. He wrote *The State and Penisons in Old Age*; *The New Fiction. A Modern Journal, Comments of Bagshot*; *The Foundation of British Policy*; *The Indian Scene. The Life of Sir Henry Campbell-Bannerman*; *Public Life* (1925); *The Changing East* (1926); *Life, Journalism and Politics* (1927); and *Through English Eyes* (1928), in which the author gives his impressions of America.

SPENGLER, shpëng'lër, OSWALD (1880–) A German scholar and writer on philosophical topics. He received international notori-

ety through the publication of his *Untergang des Abendlandes, Umriss einer Morphologie der Weltgeschichte* (2 vols., 1920–22). In this work he attempted to trace a philosophy of history and to predict, on the basis of the post-bellum disorganization of Europe, the eclipse of Western civilization. His other works include a study of the philosophy of Heraclitus (1904) and a sociological tract, *Preussentum und Sozialismus* (1922). Among his other works are *Praxismismus* (1921), *Neubau des deutschen Reiches* (1924); and *Politische Pflichten der Jugend*. The two volumes of his *Untergang des Abendlandes* were translated into English under the title *The Decline of the West*, vol. i, "Form and Actuality" (1926), and vol. ii, "Perspectives of World History" (1928).

SPERRY, ELMER AMBROSE (1860–). An American scientist and electrical engineer (see VOL. XXI). In 1926 he retired from the presidency of the Sperry Gyroscope Company, becoming chairman of the board. Since 1915 he has been a member of the Naval Consulting Board (chairman of committees on aeronautics, mines and torpedoes, and aids to navigation). He was awarded the John Fritz Medal in 1927.

SPINDEN, HERBERT JOSEPH (1879–). An American anthropologist who was born in Huron, S. D. He did field work for the Peabody Museum of Harvard University in the Western States, Mexico, Central America, etc., and was an assistant curator of the American Museum of Natural History in New York, 1909–21. Since 1921 he has been curator of Mexican archeology and ethnology at the Peabody Museum, Cambridge, Mass. He conducted an archaeological expedition to Venezuela, which was financed by the Museum of Natural History, in 1915, and published *Ancient Civilizations of Mexico and Central America* (1917); *Yellow Fever First and Last* (1921); *Civilization of the Wet Tropics* (1922); *The Reduction of Mayan Dates* (1924).

SPIRE, ANDRÉ (1868–). A French writer of Jewish extraction, the leader of a group of Franco-Jewish poets and writers in Paris, who wanted to carry forward the Jewish tradition regardless of language. Spire's published works include: *Et j'ai voulu paix, Four-nissecurs, Le secret* (war poems); *Versets: Et vous ricz, poèmes juifs* (1908); *Quelques juifs*, critical essays (1913); *Les juifs et la guerre* (1917); *Poèmes juifs* (1919); and *Tentations*, poems (1920). As a poet, Spire reflected a restless and powerful lyricism.

SPIRITUALIST ASSOCIATION, NATIONAL. An association incorporated in 1893 for the union of local spiritualist societies of the United States into an organization of mutual help and cooperation in charitable, educational, religious, and missionary activities relating to the objects and phenomena of spiritualism. Annual conventions are held in which matters relating to spiritualism are discussed. By 1929 there were 22 State associations, as well as local societies and churches. The number of churches grew from 343 in 1916 to 543 in 1926; the membership from 23,197 to 41,233; and the Sunday schools from 75 to 86. The activities of the association are carried on through four departments, the Progressive Lyceums (Sunday schools); the Bureau of Phenomenal Evidence; the Bureau of Propaganda, and the Bureau of Education. The organization conducts the Morris Pratt Institute, Whitewater, Wis., and issues the periodicals, *Progressive Thinker*, *Banner of Life*, *Reason*, and

the *National Spiritualist*. Officers in 1928 were: President, Joseph P. Whitwell, St. Paul, Minn.; secretary, the Rev. Harry F. Strack, Washington, D. C.; treasurer, F. W. Constantine, Buffalo, N. Y.

SPITZBERGEN. See SVALBARD.

SPITZKA, EDWARD ANTHONY (1876-1922). An American physician, anatomist, and psychiatrist, son of Edward C. Spitzka. Born in New York City, he was educated at the College of the City of New York and received his M.D. degree from Columbia University in 1902. His early years after graduation were devoted to anatomy and especially to brain study. He was connected with the anatomical department of Jefferson Medical College after 1904 and was director of the Daniel Baugh Institute of Anatomy from 1911 to 1914, when he removed to New York to enter upon the practice of neurology and psychiatry. He was for many years identified with brain study in general, with especial reference to comparative anatomy of the brain, including research into the brains of distinguished and abnormal individuals, such as Czolgosz, the assassin. He studied especially the action of high-voltage currents on the brain, the effects of electrocution, of reanimation after electric shock, etc., and wrote many papers on these and allied subjects. During the World War, he was a lieutenant colonel of the Medical Corps of the U. S. Army. After 1921 he was chief of the medical rating section of the U. S. Veterans Bureau. His only large contribution was an American edition of *Gray's Anatomy* with notes (1908).

SPLEEN. DISEASES OF THE. See ANEMIA.

SPOKANE, spó'kán. A manufacturing city of Washington. The population increased from 104,402 in 1910 to 104,437 in 1920 and to 109,100 in 1928, by estimate of the U. S. Bureau of the Census. The population of the metropolitan area in 1928 was 155,120. A zoning ordinance, dividing the city into six use districts with height and area restrictions, was adopted in 1928. Building construction has been active, reaching a peak in 1928 with the issuance of 2281 building permits, valued at \$5,725,232. Among the notable buildings newly erected are the Paulsen Medical and Dental Building, Montgomery-Ward Company Building, Roosevelt Apartment House, and the Episcopal Cathedral of St. John the Evangelist. Between 1917 and 1927, 180 new industries located in the city, according to a survey of the Manufacturers' Association. In 1928, 15,332 persons were employed by 492 industrial establishments in the metropolitan area and received \$22,250,000 in wages; the value of products manufactured was \$60,000,000. The municipal airport, located 3 miles east of the city on the Spokane River, was the scene of the 1927 national air races. In 1928 there were 43 public grade schools, 3 junior high schools, and 3 high schools, with an enrollment of 31,396 pupils. The clearings of Spokane's 12 National and State banks in 1928 amounted to \$700,491,595. The Federal Farm Loan Bank for the Pacific Northwest area, a branch of the Federal Reserve Bank of the twelfth district, and the Intermediate Credit Bank also are located in Spokane. The assessed valuation of property in 1928 was \$80,622,459; the net debt was \$4,688,714.

SPORTS. Separate articles on the major sports will be found under such titles as ATHLETICS, TRACK AND FIELD, BASEBALL, FOOTBALL, GOLF, OLYMPIC GAMES, TENNIS, etc.

SPRINGFIELD. A manufacturing city of Massachusetts. The population rose from 88,926 in 1910 to 129,614 in 1920 and to 149,800 in 1928 by estimate of the U. S. Bureau of the Census. A zoning ordinance, dividing the city into distinct use districts, was adopted in 1921. In 1922 the Hampden County Memorial Bridge across the Connecticut River, dedicated to the memory of the county's World War veterans, was erected at a cost of \$6,635,000. In 1925 the North End Bridge was erected on the site of a wooden structure (destroyed by fire) at a cost of \$990,171. The Shriners' Hospital for Crippled Children for the New England district was located at Springfield in 1925, and the following year the construction of the new \$5,000,000 Union Station was completed. In 1929 Springfield enlarged its municipal water-supply system by the construction of Cobble Mountain Dam on Little River above Westfield. This dam, which was built by the hydraulic-fill method, rose 245 feet above its foundations and had a total volume of 1,800,000 cubic yards. The main outlet was a 7000-foot tunnel which also was to furnish water to a hydroelectric plant located on the Little River. The annual Eastern States Agricultural and Industrial Exposition was established at Springfield in 1916. In 1927, 16,782 persons were employed by approximately 320 industrial establishments and received \$22,011,898 in wages, the value of products manufactured was \$103,921,502. Springfield ranks third in financial importance among the cities of New England, having 3 national banks, 5 trust companies, and 3 savings banks; it is also the headquarters of the Federal Land Bank of the first district. Bank clearings in 1928 amounted to \$296,082,000. In 1928, 1198 building permits representing a value of \$5,976,799 were issued. The assessed valuation of property in 1928, according to local estimate, was \$315,663,180, the net debt in 1927 was \$14,860,000.

SPROUL, ROBERT GORDON (1891-). An American University president. He was born at San Francisco, Calif., and graduated at the University of California. Since 1920 he has been comptroller and secretary of the regents of the University of California, and since 1925, vice president. He has been chosen to succeed Dr. W. W. Campbell as president on July 31, 1930. In 1921-23 he served as a member of the California State Commission on Agricultural Education.

SPROUL, WILLIAM CAMERON (1870-1928). An American public official, born at Octoraro, Pa. He was graduated from Swarthmore College in 1891 and for several years was engaged in farming. He afterward became president of the *Daily Times* and *Morning Republican*, of Chester, Pa., and he organized several important iron and steel plants and developed numerous railroad, mining, traction, and power enterprises in West Virginia. In 1896 he was elected to the Pennsylvania Senate as a Republican. He was five times reelected. In 1919 he was elected governor of Pennsylvania, serving until 1923, and taking special interest in the development of highways. At the National Republican Convention of 1920, he received the entire vote of his State for the presidential nomination, through seven ballots. Governor Sproul built and endowed the Sproul Observatory at Swarthmore College. He received the degree of LL.D. from nine colleges and universities, including Swarthmore and the University of Pennsylvania.

SPROULE, WILLIAM (1848—). An American railway president. He began in the railroad business with the Southern Pacific in 1882, and after holding various positions in the freight department of the Pacific system, became general traffic manager in 1898. In 1910 he became the president of Wells Fargo & Co. and from September, 1911, to July, 1918, he was director and president of the Southern Pacific Company. During the World War, he was put in charge of Western railways. This work occupied him until December, 1919. In 1920 he resumed the office of director and president of the Southern Pacific Company.

SPURR, JOSIAH EDWARD (1870—). An American geologist, born at Gloucester, Mass. He was graduated from Harvard University and also studied in Berlin. After a year's experience as mining engineer and geologist to the Sultan of Turkey, he became geologist of the United States Geological Survey (1902-06). During 1906-11, he was in consulting practice and in the latter year became vice president and consulting engineer of the Tonopah Mining Company of Nevada. During the World War, he served on the committee of mineral imports with the United States Shipping and the War Trade boards, after which he was chief engineer of War Minerals Investigations for the United States Bureau of Mines. From 1919 to 1927, he was editor-in-chief of the *Engineering and Mining Journal*. In 1921 he was president of the Mining and Metallurgical Society of America. He is the editor of *Political and Commercial Geology* (1921) and the author of *The Iron-Bearing Rocks of the Mesabi Range in Minnesota* (1894); *Through the Yukon Gold Diapirings* (1900); *Geology Applied to Mining* (1904); *The Ore Magmas* (1923).

SQUIER, GEORGE OWEN (1865—). An American military engineer, born at Dryden, Mich. He studied at the United States Military Academy and entered the Army as second lieutenant of the 3d Artillery, continuing in the military service until his retirement on Dec. 23, 1923. Meanwhile, having shown a decided interest in electromagnetic phenomena, especially as applied to its uses in telegraphy and telephony, he studied at The Johns Hopkins University. Among his military assignments were an appointment as instructor of electricity and mines at the United States Artillery School at Fort Monroe (1895-98); command of the United States cable-ship *Burnside* during the laying of the Philippine cable-telegraph system (1900-02); service as chief signal officer, department of California (1902), as chief of signal corps with rank of brigadier general (1917); and charge of army air service with rank of major general (1916-18). General Squier's own researches and inventions included studies on the sine-waves systems of telegraphy, multiplex telephony and telegraphy over open bare wires laid in the earth or air, tree telephony and telegraphy, and the absorption of electromagnetic waves by living organisms.

His attainments were generally recognized and he was awarded the John Scott Gold Medal (1896), the Elliott Cresson Gold Medal (1912) of the Franklin Institute, and membership in the National Academy of Sciences. For his services in the World War, he received the Distinguished Service Medal from the United States and was made a Knight Commander of St. Michael and St. George by Great Britain. He

has written a number of books on aeronautics, including *Military Aeronautics* (1908) and *Aeronautics in the United States* (1918).

SQUIRE, J(ohn) C(OLLINGS) (1884—). A British journalist and author, founder and editor of the London *Mercury*, who was born in Plymouth, and educated at Blundell's and St. John's College, Cambridge. He was literary editor (1913) and acting editor (1917-18) of the *New Statesman*. A brilliant literary critic, parodist, and journalist, he was also a poet and dreamer. His writings include *Imaginary Speeches* (1912); *Steps to Parnassus* (1913); *The Survival of the Fittest* (1916); *Tricks of the Trade* (1917); *Poems: First Series* (1918); *Books in General*, three series (1918-20-21); *Life and Letters* (1920); *Collected Parodies* (1921); *Poems: Second Series* (1922); *Essays at Large* (1922); *Books Reviewed* (1922); *Essays on Poetry* (1924); *Grub Street Nights*, stories (1924); *The Comic Muse* (1925); *Poems in One Volume* (1926), and *Life at the Mermaid* (1927). He edited *English Men of Letters* and compiled the *Cambridge Book of Lesser Poets* (1927).

STAFF, (GENERAL) See ARMIES AND ARMY ORGANIZATION.

STALIN, stā'lin, JOSIF VISSARIONOVICH (DZHUGASHVILI) (1879—). General secretary of the executive committee of the Russian Communist Party and Lenin's successor as the supreme power in Soviet Russia. Born in Georgia in the Caucasus, he joined the Social Democratic Party in 1896 and for his political activities was banished a number of times to Siberia, first in 1904. He was liberated from prison following the Menshevik Revolution of February, 1917, was one of Lenin's closest associates in the November revolution, and served as People's Commissary for Workers' and Peasants' Inspection (1919-20), and as a member of the Revolutionary Military Council of the Republic (1920-23). As secretary of the Executive Committee of the Communist Party, he gradually established himself in a dominant position by eliminating his rivals. Trotsky, his principal opponent, and 98 other members of the opposition were expelled from the Communist Party in 1927, and in 1928 many of them, including Trotsky, were banished to distant parts of the Soviet territory. In the latter year, Stalin adopted a policy calling for the systematic industrialization of the rural districts intended to eliminate the "kulaks" (well-to-do peasants) and other elements favorable to the extension of capitalism. In 1929 his effort to force a system of highly mechanized state farms upon the individualistic peasant class had provoked strong opposition. It was predicted that Stalin's continuance in power and the success of the Communist experiment in Russia depended upon the outcome of the struggle.

STALLINGS, LAURENCE (1894—). An American literary critic and playwright. He was born at Macon, Ga., and after graduating at Wake Forest (N. C.) College, did newspaper work on the *Atlanta Journal* and the *New York World*. In the World War, he served as captain in the 5th Marines, 2d Division, U. S. Army. He is the author of a novel, *Plumes* (1924), and collaborated with Maxwell Anderson in writing the plays, *What Price Glory?* (produced, 1924); *The Buccaneer* (1925); *First Flight* (1925); *Deep River* (1926); and the motion pictures, *The Big Parade* and *Old Ironsides*.

STAMBULISKY, ALEXANDER (1879-1923). A Bulgarian statesman, born at Slavovitsa, Bul-

garia, and educated, at Sofia and Halle. He became a journalist and in 1902 edited a newspaper of the Agrarian League, later becoming a member of the Bulgarian Assembly, and acquiring great influence in the Agrarian Party. He strongly opposed most of King Ferdinand's policies, and for this, and for his public statement that if King Ferdinand led the country into war again he would lose his throne, Stambulisky was sentenced to prison for life. He was released in 1918 when the Allies took Sofia. In the elections of Aug. 7, 1919, the Agrarians made great gains, and in October, Stambulisky became Premier. In the March, 1920, elections, further gains encouraged him to put into effect his plans for solving the economic and financial problems of the country. On Oct. 11, 1921, the trial, inspired by Stambulisky, of the ministers charged with responsibility for Bulgaria's participation in the World War as Germany's ally was started, and dragged through most of 1922, resulting in the conviction of 22 ministers. In 1922 he retained power by making many arrests, and when, in the next year, he announced that the constitution would be revised in such a way as to curtail royal privileges, the leaders of all the other parties were aroused and combined with the army and the King to overthrow the Government. On June 9, its members in Sofia were arrested, but Stambulisky escaped by flight, at first being accompanied by a guard of 2000 men, but later being obliged to proceed almost alone. He was shot and killed as he was crossing an open field on June 15, 1923. See BULGARIA.

STAMP, SIR JOSIAH (CHARLES) (1880-) A British economist and statistician who was educated at London University. He was in the Civil Service from 1896 to 1919, serving as assistant secretary to the Board of Trade after 1916. He received a BSc (1911) and a DSc (1916) from London University, where he was Newmarket lecturer in statistics from 1919 to 1921, and again in 1923. He was examiner for, and on the boards of, several universities, Guy Medalist of the Royal Association (1919), on the North Ireland Finance Arbitration Committee (1923-24), a British member of the commissions that drew up the Dawes Plan in 1924 and the Young Plan in 1929, and on the court of inquiry into the coal-mining industry dispute (1925). He received honorary degrees from Cambridge, Oxford, Harvard, and London universities, was knighted in 1920, made a Knight Grand Cross of the Order of the British Empire in 1924, and a fellow of the British Academy in 1926. He was chairman of the London, Midland & Scottish Railway, and also a director in other large companies. His writings include *The Application of Official Statistics to Economic Problems* (1916); *The Fundamental Principles of Taxation in the Light of Modern Developments* (1921); *Studies in Current Problems in Government and Finance* (1924); *The Christian Ethic as an Economic Factor* (1926); *On Stimulus* (1927); *Modern Economic Factors* (1928).

STANFORD UNIVERSITY. A nonsectarian coeducational institution at Stanford University, Calif., founded in 1891. The university

grew with great rapidity during the period 1914-28, both in the size of the student body and in its physical equipment and resources. The enrollment rose from 1879 in the former year to 3478 in the latter; the faculty from 229 to 506 members; and the library from 239,122 to 490,000 volumes. Herbert Hoover presented to the university in 1919 a collection of material on the World War, including the official records of the American Relief Association, the Commission for Relief in Belgium, and other great relief organizations headed by him, to these were added government documents and publications and archives and collections moved for the Food Research Institute. The Hoover War Library, as it is called, contained over 125,000 titles. The Food Research Institute was founded at Stanford in 1920-21 on endowment from the Carnegie Corporation in New York City of approximately \$700,000 to be given in annual installments over a period of 10 years. Its purpose was the intensive scientific study of the problems of the production, distribution, and consumption of food from the wide national and international viewpoint.

Three new schools and three departments were added and the system of undergraduate instruction was organized. The school of biology was organized in 1922-23 from the departments of anatomy, bacteriology, and experimental pathology, biochemistry, botany, entomology, palaeontology, psychology, physiology, and zoology, and the Food Research Institute and the Hopkins Marine Station were opened in the same year. The school of education was established in 1917 and the school of nursing in 1922. The department of mining and metallurgy was separated from the department of geology and mining, and the department of political science was established in 1918-19. The departments of Greek and Latin were combined in 1922 to form the department of classical literature.

Many buildings were erected during the period, including the Thomas Welton Stanford Art Gallery, the building on the site of the Hopkins Marine Station, and the Stanford Hospital, costing \$500,000, in 1917; a laboratory building for aircraft investigation, and Roble Hall, a dormitory for women, in 1918; a library with capacity for about 700,000 volumes forming the central structure of a new quadrangle, in 1919; the stadium, in 1921; the Stanford Union and the basketball pavilion in 1922, and in 1923 a series of dining halls for Encina Hall, and two dormitories for men, Toyon Hall, and Branner Hall, which was erected by the board of athletic control from the earnings of the stadium. In 1919 the Stanford Home for Convalescent Children was installed in the old Stanford residence and an endowment of \$100,000 was subscribed in memory of Mrs. Stanford. Through the gift of \$40,000 from Mrs. Henry Crocker, another unit of 20 beds was opened in 1924. President, Ray Lyman Wilbur, M.D., Sc.D., LL.D., resigned in 1929 to become Secretary of the Interior in President Hoover's cabinet.

STANGE, shtang'ē, CARL (1870-). A German Protestant theologian and author (see Vol. XXI). Among his later works are *Der Weg zu Gott* (1915); *Wunder- und Heilengeschichten* (1917); *Die Religion als Erfahrung* (1919); *Luther und das Sittliche Ideal* (1919); *Zum Verständnis des Christentums* (1920); *Die Ethik Kants* (1920); *Hauptprobleme der Ethik* (1922); *Christliche und philosophische Weltan-*

schauung (1923); *Jesus der Heiland* (1924); *Die Unsterblichkeit der Seele* (1925); *Unser Glaube* (1926); and *Dogmatik* (1927).

STARLING, ERNEST HENRY (1866-1927). A British physiologist. He was born at Bombay, India, was sent to King's College School, London, and afterward studied at Guy's Hospital and in Heidelberg. His collaboration with Bayliss, the great English physiologist of the time, resulted in discoveries relating to the electrical phenomena of the heart, the action of the nerves on the heart, the regulation of the circulation, and the movements of the intestines. In the World War, Dr. Starling was chemical adviser of the Saloniki forces. His works include *Elements of Human Physiology* (8th ed., 1908); *The Fluids of the Body* (1909); *The Feeding of Nations* (1919); *The Action of Alcohol on Man* (1923); and *Principles of Human Physiology* (1925).

STARR, FREDERICK (1858-). An American anthropologist (see Vol. XXI). He retired from his University of Chicago professorship in 1923, as well as from his curatorship in the Walker Museum. He edited many scientific works and is the author of *Mexico and the United States* (1914); *Dictionary of the Choctaw Language* (1917); *An Early Account of the Choctaw Indian* (1918); *The First Man* (1919); *The Origin of Religion* (1919); *Korean Buddhism* (1919); *Fuyuyama, the Sacred Mountain of Japan* (1924).

STARS. See ASTRONOMY.

STATE FINANCES. The financial condition of each State of the United States is detailed separately in the articles on the respective States. That of the State governments as a whole may be summarized in such a manner as to show the trend of State-government taxation, expenditure, and borrowing. The figures presented below, assembled by the Federal Department of Commerce, relate to State governments only and not to the public bodies governing subdivisions, such as counties, towns, cities, or tax-levying districts. The total expenditures of all the 48 States in the fiscal year 1927 (ending commonly June 30, but in many cases on other dates) were \$1,726,989,016. They were more than three times as high as the corresponding total for the fiscal year 1917, which was \$517,503,220.

A number of reasons coincided to occasion the increase in State expenditure that took place in the course of the 10 intervening years. Of these, the most obvious was the increase in population, which, although it could not be substantiated until the occasion of another Federal census, was estimated by the Census Bureau to have amounted to 17,840,000 persons, the estimated population of 1917 having been approximately 102,173,000 for the continental United States, and that of 1927, 120,013,000. The rise in the general price level, already in progress in 1917, had then hardly exerted its effect on the costs of governmental activities. As it did so later on, the expenditure upon salaries and wages, purchases, and public buildings and works increased, independent of any increase in the amounts of these things that the States required.

A third element in the causation of increasing State expenditure was the tendency to expand State functions and services. This was particularly noticeable in the matter of road building and in that of assistance to public-school education as conducted by State subdivisions. To some extent, a postponement of State public work

in the period of economic unsettlement from 1914 to 1920 and a subsequent acceleration of such work, under the spur of need to make up for lost time, had a part in swelling State expenditures after 1917.

The group of expenditures classified as payments for maintenance and operation of State departments formed the chief part of State expenditure in 1927. It aggregated \$1,120,004,895, and attained the rate of \$9.55 per capita of the population. The corresponding rate for 1917 had been but \$4.10. Thus, with allowance made for a greater population, this class of expenditure increased by 128 per cent. Only a minor part of this rise was attributable to the rise in the level of prices. These, indeed, were at approximately the same level in 1917 as in 1927, but the rise in public salaries after 1917 and, to some extent, the cost of State purchases ran behind the rise in the general price level. An important element in the higher figure for 1927 was the item of States' contributions to local public-school education. This item amounted to \$292,148,156 in 1927, which was more than one-fourth of the departmental operating and maintenance expense.

The other chief groups of State expenditures in 1927 were outlays for permanent improvements, \$518,787,568, interest on debt, \$78,721,778, and payments for maintenance and operation of public-service enterprises, \$9,474,775. The greatest of these, the group of outlay for permanent improvements, was composed, to the extent of 77.9 per cent, of outlays for highway construction. The expansion of the activity of the State governments as builders and improvers of highways was the foremost of the numerous factors in the rise of State government expenditure. It was occasioned by the general spread of the use of motor vehicles and the consequent popular demand for improved highway facilities. Maintenance of highways formed another important element in the aggregate of expenditure.

Of the divisions of the total of expenditure for operation and maintenance of State departments, that of expenditure for education made up 39.9 per cent of the total, charities, hospitals, and corrections, 17.3 per cent, highways, 15.2 per cent; general government, 8.9 per cent, protection of person and property, 5.7 per cent, development and conservation of natural resources, 5.8 per cent, health and sanitation, 2.5 per cent, recreation, 0.4 per cent, and miscellaneous expenditures, including soldiers'-bonus payments in 14 States, 4.4 per cent.

The 48 States received in 1927 revenues to the total of \$1,758,381,361. The total of their revenues thus exceeded the total of their expenditures of all sorts by \$31,392,245; nevertheless, in a number of the States, the outlay for permanent improvements caused expenditure to exceed revenue. For the States as a whole, the aggregate revenue of 1927 exceeded by \$550,179,913 the expenditures, exclusive of permanent-improvement outlay. With regard to the types of State revenue, the most noteworthy development in the period from 1917 to 1927 was the increase in the collections from licenses, which included not only corporation and business licenses but automobile licenses and the tax upon sales of gasoline. The receipts of the States from this group of taxes in 1927 were \$679,324,123; of this amount, the receipts from automobile licenses supplied \$248,846,402 and the gasoline-sale taxes furnished \$165,543,999.

STATE FINANCES FOR 1916, 1922, AND 1927

From the U. S. Bureau of the Census

State	Year	Total Receipts	Total Expenditures	Net Debt	Per Capita

* Gross debt.

* Gross debt per capita.

General property taxation, although diminished or even extinguished in some of the States, contributed a large part of the receipts of the States as a whole; the total from this source in 1927 was \$370,434,735. The property tax and the group known as special taxes furnished 38.3 per cent of the States' revenue in 1927. Their total was 121.4 per cent greater for 1926 than for 1917 and was 4.4 per cent greater in 1927 than in 1926; their per-capita ratio was \$5.73 for 1927, as against \$2.86 in 1917. Of the special taxes, the inheritance dues furnished the most important element, aggregating \$105,947,031 for 1927; 45 States levied a tax of this description. Another important special tax, the income tax, levied in 12 States, yielded an aggregate of \$54,959,392.

The total of the States' net indebtedness continued to increase in 1927, despite the fact that States' revenues on the whole tended slightly to exceed their expenditures. The net indebtedness, i.e., funded or fixed debt less sinking fund assets, attained for all the States at the end of the fiscal year 1927, \$1,444,927,194; it was \$459,661,269 in 1916. It averaged, for 1927, \$12.32 per capita, as against \$4.30, for 1917. The 1927 assessed valuation of the property in the 48 States reached the total of \$146,432,287,461. The 1928 general property tax levies of the sev-

eral States upon this total amounted to \$366,789,406. All the States save three (Pennsylvania, North Carolina, and California) made such levies.

STEAM AUTOMOBILES. See MOTOR VEHICLES.

STEAM ENGINES AND STEAM TURBINES. For large power and central-stations work (except a number of small central stations and municipal plants that employ Diesel engines) the steam turbine has almost completely superseded the reciprocating steam engine. A few of the latter are occasionally installed in rolling mills and for driving large compressors, the maximum size of such engines being approximately 5000 horse power. Also, for installation in hotels, office buildings, and public buildings, reciprocating engines of the uniflow type, in sizes under 1000 horse power, continue to be used quite extensively. Industrial plants, on the other hand, seem to favor the turbine, because of its adaptability to operating at high back pressure, to bleeding steam for process, and to operation at mixed pressure.

There are, of course, exceptions to the general practice in industrial plants and some engines

STEAM TURBINES

**TURBINE-GENERATOR OF SOUTHERN CALIFORNIA EDISON COMPANY
TURBINE-GENERATOR SET OF 94,000 KILOWATTS CAPACITY BUILT BY GENERAL
ELECTRIC CO. AND SHOWN PARTLY INSTALLED AT THE
LONG BEACH STATION**

**THE 160,000-KILOWATT CROSS-COMPOUND TURBINE-GENERATOR PUT INTO
SERVICE IN HELL GATE STATION OF UNITED ELECTRIC
LIGHT & POWER CO., NEW YORK, LATE IN 1928**

STEAM TURBINES

are being employed. One noticeable exception is the Philip Carey plant near Cincinnati which employs a steam pressure of 1800 pounds per square inch and which will have two engine-driven units of approximately 7000 horse power each. These engines are being built (Jan 1, 1929) in Germany from American designs. These engines will exhaust steam to process at 60 pounds per square inch. Owing to the higher Rankine-cycle efficiency of the steam engine at these extremely high pressures, many engineers are of the opinion that the steam engine will be more extensively used in this range if more industrial plants go to such pressures.

The uniflow type of steam engine in its present form was perfected in Germany and introduced into the United States in 1914, although the uniflow principle dates back to an American engineer, by the name of Perkins, who lived in England and built engines of this type as early as 1825. The uniflow (meaning uni-directional flow) engine is distinguished by a cylinder with a central exhaust port and a long piston. Admission ports are in either end of the cylinder and the steam flow is toward the central exhaust port. Thus, the relatively cool exhaust steam does not sweep by the hot heads on the exhaust stroke and cylinder condensation is largely eliminated. This accounts for the high steam economy of this type of engine.

Steam turbine-generating units are now built in all sizes up to 208,000 kilowatts capacity. They include a 165,000-kw., cross-compound, three-cylinder machine at Philo, Ohio, a 165,000, cross-compound, two-cylinder turbine for Hell Gate Station in New York, a 160,000, cross-compound, two-cylinder unit for the same station, a 160,000 tandem-compound with double-flow low-pressure element for East River Station, New York, a 110,000-kw, two-cylinder, cross-compound at Hudson Avenue, Brooklyn, N. Y.; a 104,000-kw, three-cylinder, cross-compound at Crawford Avenue, Chicago; and a 94,000-kw at Long Beach, Calif. The largest single-cylinder machine is a 75,000-kw., 1800-r p m unit built for Cahokia, St. Louis, and the largest 25-cycle, single-cylinder machine has recently been placed in operation at the Charles R. Huntley Station, Buffalo. The 208,000-kw, three-cylinder machine for State Line Station, Chicago, is now in service. Ultimate plans call for five such units.

Worthy of special note is the 160,000-kw. tandem machine installed in 1928 at East River Station, New York City, inasmuch as the single generator has two separate windings in alternate slots, each having a capacity of 80,000 kw. These windings are not connected electrically, but tie in with adjacent bus sections. By this arrangement, half the load could be obtained from one of the windings should the other be out of commission. On the steam end, the high-pressure element has eighteen stages and the low-pressure six. The operating conditions are 375 pounds pressure, 700° F. total temperature, and three-point extraction.

From the foregoing, it would appear that the present limits are about 75,000 kilowatts for single-cylinder machines, 160,000 kilowatts for the tandem-compound, and 208,000 kilowatts for cross-compound units. None of the large turbines mentioned is intended to operate at more than 600 pounds, or 750° F. In the opinion of one builder, 700 pounds is the practical limit for single-cylinder units and for all pressures over

this, multiple-cylinder units, with reheating, are recommended. Furthermore, 775° F. temperature seems about the limit so far sanctioned for large single-cylinder machines. Abroad, the 80,000-kw. is about the largest turbine unit employed.

The present accepted practice in central-station work is to bleed steam at several successive stages in the turbine to heat boiler feed water. Formerly, it was the practice to utilize exhaust steam from the turbines driving auxiliaries to heat feed water, but with the increased use of motor-driven auxiliaries, the other method was adopted. It is known as the regenerative cycle and results in increased plant efficiency.

Practically all central-station turbines are of the straight condensing type, with the exception of some of the 1200-lb. units that exhaust to the lower pressure turbines at around 375 pounds. On the other hand, industrial-plant turbines are of four types—(1) straight condensing turbines; (2) back-pressure turbines, which exhaust to process or heating systems; (3) mixed-pressure turbines, which receive live steam at boiler pressure and supplement this with steam from process at some lower pressure; and (4) bleeder turbines which operate under either condensing or back pressure and from which some steam at one or more intermediate pressures is bled for process.

Most steam turbines are of the axial-flow type. That is, the steam flows through successive stages parallel with the turbine shaft. A quite different type is the Ljungström, brought out some years ago in Sweden, which is of the radial-flow type. In this, the steam flows through successive stages from the centre to the periphery of the machine. Instead of alternate rows of moving and stationary blades, as in the axial-flow turbine, the alternate sets of blades in the Ljungström turbine revolve in opposite directions. This necessitates two shafts and double generators. Exceptionally high efficiencies are claimed for this turbine and a considerable number (mostly in smaller sizes, the largest being 17,000 kilowatts) are in successful operation in Europe. In 1929 none is in operation in the United States.

STEAMSHIP. See SHIPPING, SHIPBUILDING, etc

STEBBINS, JOEL (1878-). An American astronomer, born at Omaha, Neb. He studied at the University of Nebraska, and while holding a fellowship at Lick Observatory, received his Ph.D. from the University of California in 1903. He went to the University of Illinois as instructor in 1903 and became professor of astronomy and director of the observatory. In 1922 he accepted a similar position at the Washburn Observatory, University of Wisconsin. He made a specialty of stellar photometry. The American Academy of Arts and Sciences honored him with the Rumford medals in 1913 and he received the Draper Medal of the National Academy of Sciences in 1915. Dr. Stebbins served on the Lick Observatory eclipse expedition to Labrador in 1905 and also with the similar expedition to Wyoming in 1918.

STEELE, RUFUS (MILAS) (1877-). An American author, born at Hope, Ark., and educated at Pacific Methodist College, Santa Rosa, Calif. He edited various newspapers on the Pacific coast and was Sunday editor of the *San Francisco Call* and the *San Francisco Chronicle*. During the World War, he was appointed editor

of the division of films of the United States Committee on Public Information (1918-19). He has written many motion-picture scenarios and has been associated in producing the pictures. He wrote *The City That Is* (1909); *The Fall of Ug—A Masque of Fear*, produced in the Bohemian Grove in California (1913); *Rule G* (1915); *Aces for Industry* (1919); *What's Right with the Movies?* (1925); *What's Right with Florida?* (1925).

STEELE, WILBUR DANIEL (1886-). An American author, born at Greensboro, N. C., and educated at the University of Denver, the Museum of Fine Arts in Boston, and the Académie Julien in Paris. He published many short stories in magazines, and in 1914 *Storm* appeared, followed by *Land's End* in 1918. The O Henry Award Committee awarded him the second prize in 1919 for *They Know Not What They Do*, and in 1921 he received a special award from the same committee for "maintaining highest level of merit for three years among American short-story writers." In 1925 he received the first award in the Harper short-story contest for the story, *When Hell Froze*, and in the following year the first prize from the O. Henry Award Committee for the story, *Bubbles*. He wrote *Meat*, a novel, (1928).

STEEL-MAITLAND, RT. HON. SIR ARTHUR HERBERT DRUMMOND RAMSAY, FIRST BARONET (1876-). An English government official, educated at Rugby and Balliol College, Oxford, and a fellow of All Souls College (1900). He was elected to Parliament as a Conservative in 1910 and became chairman of the Unionist Party (1911), Parliamentary Under-Secretary for the Colonies (1915-17), and from 1917 to 1919, Joint Parliamentary Under-Secretary of State for Foreign Affairs, and Parliamentary Secretary to the Board of Trade. He was made a baronet in 1917, a privy counselor in 1924, and was Minister of Labor (1924-29).

STEFANSSON, VILHJALMUR (1870-). A Canadian Arctic explorer (see VOL. XXI). In 1914 he made a 600-mile sled journey over broken and moving ice from Martin Point, Alaska, to Banks Island, and in 1915 discovered new land north of Prince Patrick Island. The next year, he discovered new islands west of Heiberg Island, and in 1917 found that the polar ocean is shallow in the region northwest of Cape Isachsen. In 1929 Stefansson delivered before the Lowell Institute of Boston a course of lectures on the Arctic regions. He wrote: *The Friendly Arctic* (1921); *Go North, Young Man* (1922); *The Northward Course of Empire* (1922); *Hunters of the Great North* (1922); *The Adventure of Wrangell Island* (1925); *The Standardization of Error* (1927).

STEIN, stin, SIR (MARK) AUREL (1862-). A British Orientalist and archaeologist (see VOL. XXI), officer on special duty at the Indian Archaeological Survey, and a fellow of the British Academy. During 1913-16 he made geographical and archaeological explorations in central Asia and western China, being awarded the gold medals of the French and Swedish Geographical Societies. In 1926-28 he worked in Baluchistan and Upper Swat, receiving the Petrie Medal (1928). His later publications were *The Thousand Buddhas* (1921); *Serindia* (1921), and *Memoir on Maps of Chinese Turkestan and Kansu* (1923). F. H. Andrews wrote and illustrated *Ancient Chinese Figured Silks*, excavated by Sir Aurel Stein in central Asia

(1920); H. M. Boyer, E. J. Rapson, and E. Senart edited and transcribed and published, as *Kharosthi Inscriptions*, those discovered by Sir Aurel Stein in Chinese Turkestan (parts 1 and 2, 1920-27); and Sir George A. Grierson edited and translated, as *Hatim's Tales*, stories which had been recorded by Sir Aurel Stein (1923).

STEINACH, EUGEN (1862-). An Austrian physiologist who became famous in connection with the possibility of rejuvenating elderly animals and men through grafting the sexual glands of young animals and latterly through simple division or ligation of the efferent duct. Born at Hohen Ems, Vorarlberg, Steinach was educated at the University of Vienna (M.D. 1886) and in 1895 was appointed professor of physiology in the German University of Prague. He fitted up a laboratory for the study of comparative physiology—the first of its type in the German-speaking countries. Building on a foundation laid by the labors of two French scientists, Anel and Bouin, he performed many experiments on rats with extraordinary results. When made professor of physiology in Vienna, he was placed at the head of a special biological research institute and continued his labors. Steinach himself is not a surgeon, and gland operations on men were performed by Viennese surgeons who also reported the cases. Steinach's most important work is his small manual dealing with experiments on rats only, *Er jungung durch Experimentelle Neubelchung der Aclternden Pubertatsdrusen* (1920). Books on Steinach's work have been written by several authors. See SECRETIONS, INTERNAL.

STEINER, shtin'er, EDWARD ALFRED (1866-). An American sociologist born in Czechoslovakia. He was educated in the public schools of Vienna and at Heidelberg University. He also took postgraduate courses at other German universities and at Oberlin College. In 1891, he was ordained to the Congregational ministry and was pastor of several churches in Ohio and Minnesota. In 1903 he became professor of applied Christianity at Grinnell College, Iowa. Professor Steiner wrote: *Tolstoy the Man* (1903); *On the Trail of the Immigrant* (1906); *Against the Current* (1910); *From Alien to Citizen* (1914); *Nationalizing America* (1916); *Old Trails and New Borders* (1921); *The Eternal Hunger* (1925).

STEINER, RUDOLPH (1861-1915). An Austro-German social philosopher, born at Kriajevic, Yugoslavia. He was a commentator and editor of Goethe and an enthusiast for Hindu philosophy and mysticism. He became the German exponent of what is popularly known as theosophy but what he preferred to call anthroposophy. He founded several centres for the spread of this learning, of which the most important is the Goetheanum in South Germany, and a periodical, *Luxfer-Enosis*. His followers were subject to mild persecution. After the World War, Steiner was one of the leaders of the democratic intellectuals. He preached international reconciliation and the renunciation on Germany's part of any attempt at world dominion. Steiner's works included: *Goethe als Vater einer Neuen Aesthetik* (1889); *Goethes Weltanschauung* (1897); *Haekel und Seine Gegner* (1908); *Welt und Lebensanschauung der 19ten Jahrhunderts* (1900); *Theosophie* (1904); *Die Kernpunkte der Sozialen Frage in den Lebensnotwendigkeiten der Gegenwart und Zukunft* (1921); *Die Hetze gegen das Goethe-*

anum (1921). Other works in English translation are *Christianity as Mystical Fact and the Mysteries of Antiquity* (1914), *The East in the Light of the West* (1922). His last works are *Friedrich Nietzsche ein Kämpfer gegen seine Zeit* (1926) and *Goethes Geistesart in ihrer Offenbarung durch seinen Faust und durch das Märchen von der Schlange und der Lilie* (1926). Two volumes of *Mystery Plays* were published in English (1920).

STEINMAN, DAVID BARNARD (1886-). An American civil engineer, born in New York City. He studied at the College of the City of New York and at Columbia University. During 1910-14, he was professor of civil engineering at the University of Idaho, then had charge of the department of civil and mechanical engineering at the College of the City of New York (1917-20). In 1921 he identified himself with consulting practice in New York City, and made a specialty of constructing bridges. Among his notable works are the continuous bridge of 1550 feet at Sciotoville, Ohio, the Hell Gate arch bridge over the East River, New York City, the suspension bridge at Florianopolis, Brazil, and the Carquinez Strait (cantilever) bridge in California. He was also the engineer in charge of the Detroit-Windsor suspension bridge. He was awarded the gold medal (1920) of the American Society of Civil Engineers. In addition to numerous articles contributed to the journals of his profession, he is the author of *Suspension Bridges and Cantilevers* (1911); *Theory of Arches and Suspension Bridges* (1914); *Plain and Reinforced Concrete Arches* (1915); *Design and Construction of Suspension Bridges* (1922).

STEINMETZ, CHARLES PROTEUS (1865-1923). An American electrical engineer (see VOL. XXI). Among his later publications were *America and the New Epoch* (1916); *Theory and Calculation of Electric Circuits* (1917); *Theory and Calculation of Electrical Apparatus* (1917). Consult *Charles Proteus Steinmetz* (1924) and *Magician of Science* (1926), by J. W. Hammond; and *Loki: The Life of Charles Proteus Steinmetz*, by Jonathan Norton Leonard (1929).

STEKEL, WILHELM (1868-). An Austrian psychiatrist and psychoanalyst, one of the best known of Freud's disciples. Born at Bojan, Bukovina, he received his medical degree from the University of Vienna. Since 1908, he has shown intense literary activity and has subjected over 10,000 individuals to psychoanalysis. Of his numerous writings, the majority have been translated into English, although with more or less change in title. Most of the following are numbers in a series of volumes: *Nervöse Angstzustände und ihre Behandlung* (1908); *Die Sprache der Traume* (1911); *Die Traume der Dichter* (1912); *Der Will zum Schlaf* (1915); *Onanie und Homosexualität* (1917); *Die Geschlechtsskulte der Frau* (1920); *Die Impotenz des Mannes* (1920); *Psychosexuelle Infantilismus* (1922). These volumes are part of a great system which deals with all disorders of affective and impulsive life.

STELLAR EVOLUTION. See ASTRONOMY; PHYSICS.

STEPHENS, STEPHEN, JAMES (1882-). An Irish poet and novelist (see VOL. XXI). His later writings include: *The Rocky Road to Dublin* (1915), *Songs from the Clay* (1915); *Reincarnation* (1918); *Deirdre* (1923); *In the Land of Youth* (1924); *A Poetry Recital* (1925);

Collected Poems (1926), and *Etched in Moonlight* (1928).

STEREOCHEMISTRY. See CHEMISTRY.

STERN, STERN, L. WILLIAM (1871-). A German psychologist (see VOL. XXI). His work after the World War was devoted chiefly to mental testing and to the psychology and philosophy of personality. Both of these interests, though largely ignored by the Wundtian psychology of an earlier generation, were quite popular in post-war Germany. Stern's works after 1914 include *Vorgedanke zu Weltanschauung* (1915); *Die Psychologie und das Personalismus* (1917); *Grundgedanke der Personalistische Philosophie* (1918); *Die Intelligenz der Kinder und Jugendliche* (1920).

STERNE, ELAINE (MRS. GEORGE D. CARRINGTON) (1894-). An American photoplay writer, born in New York City, and educated at Columbia University. She wrote more than 60 photoplays, among them the Sunny Jim series and *The Gang*. Her photoplay, *The Sins of the Mothers*, brought her a prize of \$1000 in 1914, and *Without Hope*, a second prize of \$500. In the Collier short-story contest of 1914, she won a prize of \$250. She is the author of: *Sunny Jim* (1916); *The Road of Ambition*, a novel (1917), and *Over the Seas for Uncle Sam* (1918).

STEVENS, EDWARD FLETCHER (1860-). An American architect, born at Dunstable, Mass. He studied design at the Massachusetts Institute of Technology and in several offices in Boston and New York. After practicing in Rome for several years, he became a member of the firm of Stevens and Lee of Boston and Toronto. He planned over one hundred hospitals and institutions in various cities and designed also overseas hospitals during the World War. He was the author of *The American Hospital of the Twentieth Century* (rev. ed., 1921).

STEVENS, GORHAM PHILLIPS (1876-). An American architect, born on Staten Island. He studied architecture at the Massachusetts Institute of Technology and in Europe. After a year's service with McKim, Mead & White, he was Carnegie fellow in architecture at the American School of Classical Studies in Athens (1903-05). From 1912 to 1918, he was director of the School of Fine Arts at the American Academy in Rome and from 1918 to 1921, he was professor in charge. He was a member of many societies, and the author of *Life of Charles F. McKim*, and of contributions on Greek architecture to various scientific journals.

STEVENS INSTITUTE OF TECHNOLOGY. A nonsectarian institution for men at Castle Point, Hoboken, N. J., founded in 1870. The enrollment of the institute increased from 453 in 1915 to 614 in 1922 and dropped to 476 by 1928. Throughout this period, the members of the faculty increased from 37 to 51 and the library from 11,000 to about 19,000 volumes, all on technical subjects. A United States Steam Engineering School was established in 1918; the department of electrical engineering was moved in 1921 to the larger of two barracks buildings bought from the government, and the space so vacated in the main laboratory building was given to the department of physics; comprehensive examinations in elementary and advanced mathematics were made requirements for entrance for applicants offering certificate credits for admission. A gymnasium was built, and two acres adjoining the main building, bought

in 1915, making in all about 22 acres of land including the original "Stevens Castle." A gift of \$35,000 to found a chair of economics of engineering, in memory of former president Alexander C. Humphreys, was announced in 1928. Productive funds in that year amounted to \$2,764,000. President, Harvey Nathaniel Davis.

STEVENSON, JAMES, FIRST BARON OF HOLMBURY (1873-1926). A British industrialist and founder of the Stevenson rubber control plan. He was born at Kilmarnock, and educated at the academy there, became a traveling salesman, and then rose to be managing director of John Walker & Sons, Ltd., distillers at Kilmarnock. He became prominent during the World War, when he served in the Ministry of Munitions in various capacities. Subsequently he was a member of numerous government boards and committees. As chairman of the rubber investigation committee, he formulated the plan, in effect from 1922 to 1928, which limited the production of rubber and the amount exported from British centres of production, thus raising the price. In 1917 he was made a baronet, in 1922 a Knight Grand Cross of St. Michael and St. George, and in 1925 a baron. France made him a Commander of the Legion of Honor.

STEWART, DONALD OGDEN (1894-). An American humorist, born at Columbus, Ohio, and educated at Yale University. According to his own story, he was so well equipped for a business career that he turned to literature, and wrote: *Parody Outline of History*; *Perfect Behavior* (1922); *Aunt Polly's Story of Mankind* (1923); *Mr. and Mrs. Haddock Abroad* (1924); *The Crazy Fool* (1925); *Mr and Mrs. Haddock in Paris, France* (1926); *Father Williams*, novel (1928). During the World War, he served as chief quartermaster in the United States Navy.

STEWART, SIR JAMES PURVES (1869-). A British physician and neurologist, born in Edinburgh and educated at the universities of Edinburgh and Jena. His *Treatises on Nervous Diseases* (6th ed., 1924) has been translated into French, Spanish, German, and Arabic. He also published (with Evans) *Nerve Injuries and Their Treatment* and in 1927 *Intracranial Tumors*. He was knighted in 1921.

STEWART, JULIUS L. (1855-1919). An American painter, born in Philadelphia. He studied under Gérome and Madrazo in Paris, where he lived the greater part of his life. He was known as a figure and genre painter, his style being decidedly French in finish, but his characterizations of American types were excellent, particularly his studies of members of the American colony in Paris.

STEYFFERT, LEOPOLD GOULD (1887-). An American portrait painter. He was born at California, Mo., and was a pupil of Chase, becoming an associate of the National Academy of Design in 1916. He received the Altman Prize of the National Academy in 1918, the Palmer Gold Medal in 1923, the Logan Medal in 1924, the Hearst Medal in 1924, the Statesbury Prize of the Pennsylvania Academy of Fine Arts in 1926. In 1925 he became a member of the National Academy. See PAINTING, under *United States*.

STIDGER, WILLIAM LEROY (1885-). An American clergyman and author, born at Mountsville, W. Va., and educated at Brown University and Boston University. He was ordained in the Methodist Episcopal ministry in 1914 and preached in San Francisco (1914-16) and in

San José (1916-19). He served during the World War as a truck driver in France for the Y. M. C. A. He was pastor of St. Mark's Church, Detroit, 1920-25, and since 1925 has been pastor of Linwood Boulevard Church at Kansas City. His writings include: *Giant Hours with Poet Preachers* (1918); *Soldier Silhouettes* (1919); *Star Dust from the Dugouts* (1919); *Outdoor Men and Minds* (1920); *Standing Room Only* (1921); *Flash Lights of the Seven Seas* (1921); *Flames of Faith* (1922); *There are Sermons in Books* (1922); *Henry Ford, the Man and His Motives* (1923); *The Symphonic Sermon* (1923); *Finding God in Books* (1924); *Spiritual Messages from Fiction and Drama* (1927).

STILL, GEORGE FREDERIC (1868-). A British physician and pediatrician, born at Holloway, London, and educated in arts at Caius College, Cambridge, and in medicine at Guy's Hospital, London. He is professor of diseases of children at King's College, London, author of a textbook on this subject, and is widely known for his discovery of the malady known as "Still's disease."

STILLMAN, JOHN MAXSON (1850-1923). An American chemist, born in New York City. After graduating from the University of California, he studied at Strassburg and Wurzburg, and later received his Ph.D. degree in California. He was instructor in chemistry at the University of California (1876-82) and a commercial chemist (1882-91). In 1891, he became a member of the first faculty of Stanford University, and in 1913 was made vice president, an appointment which he held until his retirement under the age limit as emeritus in 1917. His original investigations included researches in both organic chemistry and mineral chemistry, but his most important work was on the history of chemistry and included a life of *Paracelsus as Physician, Chemist, and Reformer* (1920), and a manuscript volume, *The Story of Early Chemistry* (1924).

STIMSON, HENRY LEWIS (1867-). An American lawyer, cabinet officer, and administrator (see Vol. XXI). During the World War, he served as lieutenant colonel of the 305th Field Artillery and as colonel of the 31st Field Artillery, part of the time in France. Later, he was made a brigadier general in the Officers' Reserve Corps. In 1927 he was sent to Nicaragua as the special representative of President Coolidge and formulated a plan for the pacification of the country which was agreed to by both major parties of Nicaragua and successfully carried out through a general election held under American supervision. In the winter of 1926-27, he had visited the Philippines at the request of his close friend, Governor General Wood, and had studied the situation there as an unofficial adviser to General Wood. With his comprehensive knowledge of the Philippines, he was chosen to succeed General Wood upon the latter's death in 1927. As Governor General, he approved the Belo measure, passed by the Philippine Legislature, which increased the departmental autonomy of Filipino administrators while strengthening the Governor General's inspection and advisory powers. The cooperation of the Legislature thus secured was further strengthened by his selection of a cabinet from the majority party of the Legislature and his appointment of a Council of State, composed of all members of the cabinet and other native leaders. His administration was marked by the virtual disappearance of the independence agitation and by the passage of measures by the Legis-

lature encouraging the investment of American capital for the economic development of the islands.

In March, 1929, President Hoover appointed Colonel Stimson Secretary of State. In this capacity he supervised the naval disarmament negotiations with Great Britain and the other naval powers which continued throughout that year. In 1920 he received the honorary LL.D. degree from Yale and New York universities. He wrote *American Policy in Nicaragua* (1927).

STINNES, HUGO (1870-1924). A German industrialist and financier, born at Mulheim, Germany. At 19 years of age, he entered the mining company owned by his father in Westphalia, where he remained two years. He then organized his own company, called Hugo Stinnes, Ltd., the whole original share capital being 50,000 marks (about \$12,000). His first important success was the creating of the German-Luxemburger Mining and Foundry Corporation—the first exemplification of his famous "vertical trust" building. The company owned its own coal, its own ore, and its foundries for the manufacture of its product through all its stages. He extended his holdings to ships and became the most important shipping man in Germany. He organized great companies for making iron and steel, he bought forests, chateaus, hotels, railroads. He owned the largest oil concession in the Argentine, the great electrical plants that are the power centre of Rhenish-Westphalian industry, lime kilns, tanneries, sugar refineries, moving-picture concerns, and vast lands in South America. When the World War came, Stinnes grasped the tremendous opportunity to add to his power. He was partially responsible for the ruthless industrial exploitation of occupied Belgium. He supplied war materials of all kinds. Then he began to make his influence felt in the political field. He was elected to the Reichstag in 1920, and about the same time bought many of the leading German newspapers, and large interests in paper-manufacturing establishments. In 1921 he was busy with a scheme for a supertrust that would control every industry in Germany and regulate production, transportation, and the supply of the German markets, as well as those of the whole world. His financial manoeuvres were made possible only by the steady depreciation of the German currency, which he aided by preventing the stabilization of the German mark and repeatedly borrowing money only to pay it back in inflated paper. Many books were written about him, among them *Kurt Heinrich Stinnes und seine 600,000 Arbeiter* (1921); Johann Rump's *Der Kaufmann von Mülheim*, a novel about his life, published anonymously (1922), and he is also included in Maximilian Harden's *Köpfe* (1910-1924).

STIRLING, MATTHEW WILLIAMS (1896-). An American anthropologist. He was born at Salinas, Calif., and graduated at the University of California (1920). In 1921 he was appointed assistant curator of the Bureau of Ethnology, National Museum, Washington, D. C. He studied Indian burial grounds in North Dakota and Indian mounds near St. Petersburg, Fla. He also explored archaeological caves in Southern France and Northern Spain. He was in charge of an expedition to New Guinea for the study of pygmies in 1926. In the World War, he was an ensign in the U. S. Navy. He became chief of the Bureau of Ethnology in 1928.

STOCKER, HARRY EMILIUS (1876-). An American clergyman and author, born at Nazareth, Pa., and educated at the Moravian College at Bethlehem, Pa. Ordained in the Moravian ministry in 1902, he held several pastorates, taught in the Moravian College in Bethlehem for a year, and then became pastor of the First Church in New York City in 1919. He has been a member of the administrative committee of the Federal Council of Churches and held offices in many Moravian church organizations. His writings include *History of the White River Indian Mission in Indiana* (1917); *Moravian Customs and Other Matters of Interest* (1918); *History of the Moravian Church in New York City* (1922); *Home Mission History of the Moravian Church* (1923).

STOCKHOLM. The capital of Sweden. The population, according to the census of 1920, was 419,440, it was estimated to be 464,699 in 1928. The most characteristic feature of Stockholm's recent progress is the development of a distinctly national type of architecture. This type, combining rugged strength with modern engineering progress, is reflected especially in the public buildings: the City Hall, the City Law Courts, the magnificent Royal Technical College buildings, the Engelbrekt Church which dominates one of Stockholm's finest residential sections, the stadium erected for the Olympiad of 1912, and the Concert Hall which adheres to classical traditions. The City Hall, which was erected between 1911 and 1923 at a cost of \$4,000,000, was dedicated on the 400th anniversary of the beginning of the reign of Gustavus Vasa, Sweden's first hereditary ruler. The hall is a vast rectangular structure built of native brick and crowned by a lofty square tower, beneath the cornice is a frieze ornamented with gilt reliefs of persons eminent in Swedish history. The hall incloses two courts: the larger (Citizens' Court) is open; the smaller (Blue Room) is covered and is used for official banquets and similar civic affairs. Since the city is constantly expanding on the mainland, it has been found necessary to erect two bridges across the North Stream at an estimated cost of 20,000,000 crowns (\$5,300,000). One of these will carry street-car lines so as partly to eliminate traffic congestion in the older section of the city. Stockholm's unique out-door museum is located in Skansen, one of the city's large natural parks. Its old farmhouses, medieval wooden churches, and other buildings depict much of Sweden's life in the past and the present. The idea of this museum was conceived about 50 years ago by the well-known art lover and antiquarian, Arthur Hazelius, who desired to preserve for posterity the customs of the Swedish people. Stockholm's harbor is the largest in Sweden for import trade. In 1928, 374 vessels of 402,324 gross tons were entered and cleared. The new Free Port, which is located a few miles from the town, has proved an important asset to Baltic shipping trade. The Stockholm aerodrome is located at Lindarängen.

STODDARD, (THEODORE) LOTHIROP (1883-). An American author, born at Brookline, Mass., and educated at Harvard University. He was admitted to the bar in Massachusetts in 1908. His writings include *The French Revolution in San Domingo* (1914), *Present-Day Europe—Its National States of Mind* (1917); *The Stakes of the War* (1918); *Harper's Pictorial Library of the World War*, vol. vi; *The*

World at War (1919); *The Rising Tide of Color Against White World-Supremacy* (1920); *The New World of Islam* (1921); *The Revolt against Civilization* (1922); *Racial Realities in Europe* (1924); *Social Classes in Post-War Europe* (1925); *Scientific Humanism* (1926); *Reforging America* (1927); *The Story of Youth* (1928).

STOESSEL, ALBERT FREDERICK (1894-). An American violinist and conductor, born at St. Louis, Mo. From 1910-1913, he studied the violin under W. Hess and E. Wirth at the Hochschule für Musik in Berlin, where he made his début in 1913. After the outbreak of the World War, he returned to the United States, making his American début with the St. Louis Symphony Orchestra (1915). In 1917 he enlisted in the U. S. Army and was appointed director of the School for Bandmasters. After his return in 1919, he became assistant conductor of the New York Oratorio Society, and in 1921 was elected regular conductor. In 1923 he was appointed head of the newly established Department of Music at New York University. In 1925 he was elected conductor of the Worcester Festival, and in 1928 also of the Westchester County Festival. His compositions include a string quintet; smaller pieces for violin and piano, and *Suite Antyque*, for orchestra.

STOKES, ADRIAN (1887-1927). A British physician and pathologist, born in Lausanne, Switzerland. He received his medical degree from Dublin University in 1911 and carried on extensive researches in pathology there until the outbreak of the World War, when he joined the Royal Army Medical Corps. A discovery made by him that infectious jaundice is conveyed by rats gave him an international reputation. In 1922 he was appointed professor of pathology in the University of London. He had already visited Africa in 1920, as a member of the Rockefeller Commission, and in 1927 after an outbreak of yellow fever there, he was requested to rejoin the staff. He began experiments with chimpanzees in order to throw light on the mode of transmission and was making good headway when he himself was fatally stricken with the disease.

STOKES, ANSON PHELPS (1874-). An American educationist, born at New Brighton, Staten Island, N. Y. He was graduated from Yale in 1896 and from the Episcopal Theological Seminary in 1900. After spending several years in travel, he was appointed secretary of Yale University in 1899, where he remained until 1921. He was ordained in the Protestant Episcopal Church in 1900 and from that year to 1918 was assistant minister of St. Paul's Church, New Haven. He was appointed a canon of Washington Cathedral in 1924. From 1917 to 1919, he was chairman of the trustees of the American University Union in Europe, and was secretary and chairman of the educational commission of the Phelps Stokes Foundation. He organized the Army Educational Commission and was founder of the National Commission for Mental Hygiene. He was decorated by several foreign governments for his work. He is the author of *Memorials of Eminent Yale Men*; *What Jesus Christ Thought of Himself*; *Historic Universities in a Democracy*; *A Visit to Yale in China*; *Yale and New Haven*.

STONE. Subsequent to the World War, the production of stone in the United States has shown a steady expansion. The high rate of activity in the building trade and in railroad

and highway construction and repair has had a direct influence on increasing the production of stone.

In 1927 about 136,345,260 short tons of stone, valued at \$198,661,622, were produced in the United States. The 1927 output established a new record by a considerable margin as the previous record year had been in 1920, when 124,496,360 short tons valued at \$188,308,590 were produced. The distribution of the various kinds of stone produced in 1927, as regards quantity and value, is shown in the accompanying tabulation. Crushed stone, which represents the greater part of the output, is used largely as railway ballast, road "metal," and for concrete. Building stone includes granite, sandstone, and marble. During recent years, there has been a tendency to use flagstone more and more for decorative purposes.

Though the consumption of stone has shown a healthy growth in recent years, competition has increased and there has been a tendency toward lower prices. Many of the larger stone producers are meeting this condition by increasing the economy and efficiency of their productive operations. Pennsylvania is the leading State from the standpoint of stone production. Other important producing States are Ohio, Michigan, New York, and California.

STONE SOLD IN THE UNITED STATES IN 1927
(From *Rock Products*)

	Short Tons	Value
Crushed stone	94,948,770	\$97,474,267
Building stone	2,185,120	40,595,127
Monumental stone	358,130	14,993,091
Paving blocks	366,740	3,583,100
Curbing	378,230	4,939,716
Flagging	55,160	573,736
Rubble	809,020	988,108
Rip rap	4,618,500	4,716,731
Flux stone	21,660,070	15,985,525
Refractory stone	1,362,920	1,710,708
Agric. limestone	2,206,470	3,360,704
Manufacturing industries	5,352,110	4,735,114
Other uses	1,738,000	4,995,395
Total	136,345,260	\$198,661,622

STONE, HARLAN FISKE (1872-). An American jurist (see VOL. XXI). From 1910 to 1924, he was dean of the school of law at Columbia University. He was a member of the Legislative Drafting Research Fund and frequently acted as adviser before legislative committees in both the State and National governments. Amherst College conferred a degree (LL.D.) upon him in 1913. He was appointed, by President Coolidge, in March, 1924, Attorney General of the United States to succeed H. M. Daugherty and was made associate justice of the Supreme Court of the United States again by President Coolidge's appointment, in 1925.

STONE AGE. See ANTHROPOLOGY.

STORAGE BATTERIES. See MOTOR VEHICLES.

STORRS, LUCIUS SEYMOUR (1869-). An American railway official, born at Buffalo, N. Y., and educated at the University of Nebraska. After holding various important positions with several railway organizations, he became the vice president of the New York, New Haven & Hartford Railroad in 1914. He was president of the American Electric Railway Association in 1917 and managing director since 1925.

STOVALL, PLEASANT ALEXANDER (1857-). An American diplomat, born at Augusta, Ga., and educated at the University of Georgia. He edited the *Athens Georgian*, *Augusta Chron-*

icle, and Savannah Press, and became the owner of the last-named. He was elected to the Georgia House of Representatives in 1902 and again in 1912-13. He was United States minister to Switzerland, 1913-20. In 1891 he wrote a *Life of Robert Toombs*.

STRACHEY, strā'chī, (GILES) LYTON (1880-). A British biographer. He was educated at Trinity College, Cambridge, and became a critic whose special field was French literature. He published *Landmarks in French Literature* (1912). Then he became interested in real instead of fictitious characters, first in Voltaire and other Frenchmen, and then in the characters of the Victorian era in England. In *Eminent Victorians* (1918), he developed a new and fresh manner of treating the lives of the eminent dead, which was continued with more assurance in *Queen Victoria* (1921). His later works are *Books and Characters, French and English* (1922); *Pope*, the Leslie Stephen lecture at Cambridge (1925); and *Elizabeth and Essex* (1928), another brilliant account of an English queen and her circle.

STRACHEY, JOHN ST. LOE (1860-1927). A British journalist (see Vol. XXI). In December, 1925, he retired from his editorship of the *Spectator* because of ill health, but continued to be an intermittent contributor. He was a frequent visitor to Canada and the United States, and received an honorary Litt D. from Columbia in 1925. His later publications include *The Adventure of Living* (1922); *Economics of the Hour* (1923); *The Referendum* (1923); *The River of Life* (1924); *The Madonna of the Baracades* (1925); and *American Soundings* (1926).

STRAITS SETTLEMENTS. A British colony comprising the island of Singapore, the island of Penang (with the land settlements of Province Wellesley), and Malacca, on the western coast of the Malay Peninsula. Total area, 1600 square miles; total population in 1911, 714,069. In 1921 the population was 883,769, divided as follows: Singapore, 425,912; Penang, 304,835; Malacca, 153,522. Males numbered 557,838, females, 324,101. In 1918 there were in the Settlements 274,574 Malays, 432,764 Chinese, and 94,213 British Indians. Immigrants in 1927 were 359,262 Chinese and 156,132 Indians. The population in 1927 was estimated at 1,059,968, including 10,305 Europeans and Americans.

Industry and Trade. The increasing attention which the natives gave to rubber cultivation to the exclusion of food crops, particularly rice, led to the dependence on imports for consumption needs. Difficulties ensued when the United States restricted its importation of rubber in 1918 and when neighboring countries, because of crop shortages, failed to send sufficient quantities of rice. Other industries declining in the face of the growing rubber culture were coconut, clove, nutmeg, and gambier. The leading activity continues to be commerce, for the Settlements are one of the most important transshipment and trading points in the world. Imports and exports for typical years, inclusive of treasure and trade with Federated Malay States, were: for 1913, £55,936,472 and £45,375,132; for 1920, £148,187,421 and £119,471,984; for 1921, £68,126,020 and £58,025,105; for 1927, £146,512,588 and £126,880,783. Fifty per cent of the total trade came from or went to the British Empire. Principal imports in 1927 were rice and other grains, tin ore, cotton goods, tobacco, cigars and cigarettes, fish, sugar, petroleum, and coal. Prin-

cipal exports were rubber and gums, tin, copra, spices and pepper, tapioca, pineapples, and rattans. In 1913 shipping entered and cleared, exclusive of native craft, was 27,125,000 tons, of which 15,251,000 were British. In 1927, 39,693,766 tons entered and cleared the ports of the territory. In 1923 a causeway was completed across the Johore Straits to connect Singapore with the mainland. This made through train service between Bangkok, Siam, and Singapore possible.

The port of Singapore has been constantly increasing in importance in recent years. In 1923 entrances and clearances amounted to 12,479 vessels of 20,512,572 tons, an amount which in 1928 had increased to 19,410 vessels of 29,389,813 tons. The commerce of 1928 consisted of 19,410 merchant vessels of 29,389,813 tons; 42,303 native craft of 1,676,989 tons; and 124 men-of-war, etc., of 426,252 tons. Great Britain naturally ranked first in merchant tonnage with 12,286,244 tons, followed by the Netherlands with 6,435,707 tons, and Japan with 3,841,421 tons. New deep-water wharves were being planned as it was believed that Singapore would soon occupy an important position among the world's greatest shipping ports.

Government finances showed increases over the period. Revenues for 1913 and 1927 were £1,446,403 and £4,386,909, expenditures, £1,221,338 and £4,579,548. The budget for 1928 called for revenues of 32,916,545 Straits dollars and expenditures of 38,950,949 Straits dollars. The debt totaled, on Dec 31, 1927, £25,653,975. An important source of revenue is the government monopoly of opium. The governor of the Settlements is also high commissioner for the Federated Malay States, as well as for Brunei, and is the British agent for North Borneo and Sarawak. See FEDERATED MALAY STATES.

British North Borneo. A British protectorate on the island of Borneo under the jurisdiction of the British North Borneo Company and for which the Governor of the Straits Settlements acts as British agent, as he does also for Sarawak. Area, 31,106 square miles; population (1921), 257,804, mainly Mohammedan settlers and native aborigines. Europeans numbered 533; Chinese, 37,856. Revenues for 1913 were £210,197 and for 1927, £454,588; expenditures for the same years were £259,494 and £256,440. Imports for the years 1913, 1920, and 1927 were £634,538, £1,284,438, and £1,224,705. Exports for the same years were £863,115, £1,405,771, and £1,978,596. Rubber, tobacco, and timber, shipped to Singapore and Hongkong, are the most important exports. Opium, an official monopoly, is one of the leading sources of revenue. There is no public debt.

Brunei, brōo-nī'. A British protectorate southwest of British North Borneo. It has close commercial relations with the Straits Settlements but is administered by a British resident acting for the Sultan Ahmed Tajudin Akhazul Khairi Wad-din, a minor who succeeded to the throne in 1924. Area, 2500 square miles; population (1921), 25,454, of whom 35 were Europeans and 1434 Chinese. Exports are cutch (mangrove extract), coal, rubber, and sago. Oil was discovered, but not in paying quantities. There is a wireless station at Brunei, the chief town.

Sarawak, su-ra'wāk. A British protectorate southwest of Brunei. The Governor of the Straits Settlements serves as British agent. Area, 42,000 square miles; population (esti-

mated), 600,000. Imports in 1927, £25,664,546 Straits dollars, exports, 49,786,143 Straits dollars. Chief exports are sago, pepper, rubber, liquid fuel, and gold. Trade is with Singapore. Revenues in 1927 were 6,243,065 Straits dollars (from customs, opium, gambling, arrack, and pawn-farm taxes); expenditures, 5,764,318 Straits dollars.

STRASSBURG, shtras'bōōrk. An important commercial centre of France and former capital of the Province of Alsace, now chief town of the Department of the Bas-Rhin, and 502 kilometers (311.9 miles) from Paris. See ALSACE LORRAINE. The population, according to the census of 1926, was 174,492. The port of Strassburg has been autonomous since 1924, when the French National Assembly approved the bill granting this privilege and the execution of important constructional works. These comprised the construction of a canal 90 meters broad parallel to the Rhine River and connected with the existing installation, a petroleum dock or basin communicating directly with the Rhine, six inner docks along the canal frontage, and extensive railway connections. The estimated cost was nearly 250,000,000 francs. Before the War, the Swiss had built an inland port at Basel in anticipation of the improvement, below that town, of the channel of the Rhine, which is normally navigable only during the summer season by barges of small draught. Swiss and German opinion favored the improvement of the river either by regulation and deepening or by canalization. The French, however, pressed strongly for the construction of a lateral canal and by Clause 358 of the Treaty of Versailles were authorized to build such a canal alongside the Rhine between Basel and Strassburg and to draw water from the river for the production of electric power. The French claim was upheld by the Central Commission of the Rhine appointed in 1925, which approved the construction of the canal with the understanding that it must be as navigable and as free as the river itself. In 1927, the first section of the canal, that between Basel and Kembs, was begun by France and was expected to be completed in 1932. The canal and its locks will accommodate Rhine barges of more than 1200 tons. Vessels using the port of Strassburg in 1926 included more than 3000 barges with a capacity of more than 750 tons and nearly 250 tugs of from 500 to 2000 horse power. The traffic of the port totaled 3,200,000 metric tons, the principal commodities being coal, grain, potash, ores, and oil. Imports accounted for almost two-thirds of the tonnage.

In 1926 the restoration of the famous steeple of the Cathedral of Strassburg which had been in process for nearly 20 years, was successfully completed. The wooden piles upon which the steeple rested for nearly six centuries have been supplanted by a foundation of reinforced concrete. The municipality contributed approximately 1,700,000 francs to the fund, and after the city became French again, the Government of France gave 2,000,000 francs to carry on the work. The city's Historical Museum is housed in the Grande Boucherie, its collection including documents and objects relating to the history of Strassburg from the Middle Ages to the entry of the French troops in November, 1918. The Imperial Palace in the German-built quarter is destined to be converted into a museum, and the former Hall of the Provincial Diet is occupied by the conservatory of music.

STRATEGY AND TACTICS, MILITARY. Military strategy is the science and art of projecting and directing important military movements and operations with the object of securing advantageous positions of supply, attack, defense, or retreat, and deals in general with large forces not engaged in battle. Military tactics is the science and art of leading and maneuvering troops on the battlefield or its immediate vicinity. The goal of both is the same, the defeat of the enemy by the delivery of the most powerful blow possible at his weakest point, or, when acting on the defense, to prevent or successfully resist such an attempt by the enemy.

Changes in Tactics Developed in the War. The basic principles of strategy were little affected by the test of the World War. Although on a far greater scale than ever before, the mobilization of the armies and their movements into position for attack or defense did not differ essentially from the methods that had been employed in previous wars. The tactics employed, however, underwent some modification, owing to the increase in fire power of weapons in use at the outbreak of the War, and the introduction of new weapons and other novel war material.

In early days, before the invention of firearms, shock action was almost entirely depended upon for the decision, which required tactics utilizing the troops in masses or columns. The introduction of firearms and their gradual improvement resulted in fire power and movement becoming the predominant factors, and brought about deployment of troops on a wide front in order to secure them. Experience teaches that under present conditions neither shock action nor fire power alone can win, the two must be used in combination, and modern tactics endeavor to provide means whereby fire power may be utilized to open the way for shock action to strike the decisive blow. This blow should be directed at the enemy's weakest point, if it can be determined in the initial deployment, otherwise a mobile force must be held in readiness to launch an attack against the weak point when it is revealed.

During the first phase of the World War, before the lines became stabilized, the tactics used in combat were those which had been inculcated in peace-time training, the deployment of infantry being made with considerable strength in the skirmish line in order to secure fire superiority and the advance being made by successive rushes of assaulting units, the attack being supported by artillery fire. The increase in rapidity and precision of artillery fire and the effective use of machine guns caused a thinning of the assault line and the organization of the attacking force in greater depth, in order to minimize losses. This change in formation also gave greater power of maneuver.

In defense the tactics were similarly modified. After the first phase, when the lines became stabilized on the Western front, both sides occupied nearly continuous front-line trenches extending from Switzerland to the Channel, strongly garrisoned, dependence being placed on the fire power of this line supported by an artillery barrage to repel the enemy's attack. The heavy losses and almost complete destruction of the front-line trenches due to the artillery preparatory fire of the attacking troops led to the adoption of a modified organization of the terrain whereby the front line was held weakly by outposts with a main line of resistance at the rear so located that the attacking forces would be more or less

disrupted when it was reached and would be beyond effective support by their artillery and consequently more easily repulsed by counter-attack.

Therefore, organization in depth was adopted for defense as well as for offense. The conditions which brought about these changes were those due to the introduction of new weapons and devices and a supply of ammunition in greater quantity than ever before.

Airplanes and tanks and the utilization of gas were the major influences, to which should be added improved machine guns, automatic rifles, light mortars and the 37-millimeter gun as integral parts of the fighting equipment of the infantry.

Airplanes. At the beginning of the War, airplanes were few in number and were used practically entirely for reconnaissance. Very rapidly, however, their use was extended to include observation and direction of artillery fire, location of front-line units, photographing the enemy positions and transmitting orders and, in certain cases, the carrying of supplies to isolated units. Then machine guns were mounted on them and combat planes were developed which fought aerial battles to decide the supremacy of the air and deny to the enemy the aerial observation which had become so important. It was also found that bombs could be dropped from them and that by such means strategic points in the enemy's rear could be effectively attacked. As these various uses developed to a greater and greater extent, it was even found practicable to attack the enemy troops on the battlefield with machine-gun fire and bombs. See **AERONAUTICS**.

The use of anti-aircraft guns and of machine guns to prevent observation and destroy the airplanes did not prove of great value. Very few airplanes were destroyed by such means, although well-directed fire forced the airplanes to heights where observation was imperfect, and it was found that the most effective way to keep the enemy airplanes in check was to fight them in the air by combat planes in superior force. The control of artillery fire by aerial observation was a tactical change of signal value.

Captive Balloons. These also were effectively used for observation and control of artillery fire, although, to avoid destruction by enemy artillery and airplanes, they had to be kept well in the rear. Under favorable weather conditions, however, observation was good and the advantages of a stationary position and direct wire communication were great.

Dirigibles. The great cost, long time of construction, large target offered, and special landing arrangements required prevented dirigibles from being successfully employed and having extended use during the War, even though they could carry large quantities of explosives and supplies. Their principal use and success was in naval warfare.

Tanks. Armored motor cars with machine guns mounted were developed before the War and under certain conditions were effective in reconnaissance and for courier service, but they could operate effectively only on roads in fair condition. The invention of the tank produced a machine that could operate across country, destroy wire entanglements, cross trenches, break down light walls and which, armed with one-pounders or machine guns, proved a very useful aid to the infantry in attack, heavy tanks usually preceding the infantry to open ways through

obstacles and cover the infantry during the cleaning up of a captured position, light tanks usually accompanying the infantry to support them in their attack, and to destroy enemy machine-gun nests.

Gas. The introduction of gas also had an influence on tactics. The cloud attack in which gas was first used, and later the concentration of gas on certain areas by means of gas shells, assisted an attacking force by compelling the enemy to remain in shelters during the advance or fight when handicapped by wearing masks. Many kinds of gas were used during the War, from the early irritating and suffocating types, such as chlorine and phosgene, to lachrymal and blistering types, as benzyl bromide and mustard gas. The most effective were phosgene and mustard gas, although tear gas and other types were of value under certain conditions.

As a development from the introduction of gas came the use of smoke clouds to screen the advance of an attacking line or to cut off observation by the enemy. See **CHEMICAL WARFARE**.

Infantry Weapons. The automatic rifle, introduced during the War, provided means for maintaining the fire power of the thinner skirmish line and enabled concentrated fire to be delivered on appropriate targets. Its value in holding attacks, and in covering weak points in defensive positions, has been proved.

Machine Guns.—At the beginning of the War, machine guns had not been perfected, were comparatively few in number and the technique of their employment was in an experimental stage. At that time, the German army was greatly superior both in number of machine guns and in trained gunners. The improvements developed as the War progressed increased their reliability of functioning, and experience led to methods of use which rendered them tremendously effective both in offensive and defensive action, in the former case assisting the attacking skirmish line to achieve and maintain fire superiority, as well as at times supporting the advance by indirect barrage fire over the heads of the advancing troops, and in the latter case delaying and disrupting the attacking forces by concentrations from concealed positions and by flanking fire delivered along the belts of wire in front of strong points and centres of resistance. In open warfare, they proved most valuable in delaying rear-guard actions. In 1928 the number of machine guns in the machine-gun company of an infantry battalion was increased to 12. See **SMALL ARMS AND MACHINE GUNS**.

Hand Grenades.—The position warfare, which lasted so long on the western front, called for weapons that could deliver high-angle fire in order to reach narrow trenches at short range. To fill this need, the hand grenade was developed, at first a crude can filled with explosive and fired by a time fuse. From this beginning came the offensive grenade, with a thin metal case whose fragments could not injure the thrower but which produced the desired effect on the enemy by the shock of the explosion; and the defensive grenade, thrown from a protected position, with a heavy metal case which, when the grenade burst, broke into fragments and added the effect of the flying pieces to the shock of the explosion. Later improvements resulted in grenades filled with various gases and chemicals for special uses. The invention of the method of discharging grenades by rifle fire from a cup

placed on the muzzle of the rifle increased very greatly the range and accuracy of fire.

Trench Mortars and One-Pounder Guns.—Another weapon developed for high-angle fire was the trench mortar varying from the 3-inch light Stokes mortar capable for brief intervals of firing 40 or more 12-pound shells a minute up to 6-inch, 8-inch, and larger mortars firing heavier shells at a lesser rate of fire with greater range and more destructive effect. These mortars, especially the light ones, which could be fired from concealed positions close up to the skirmish line of an attacking force, proved very effective against machine-gun nests, and because of their high trajectory were useful in laying down fire on the reverse slope of a hill. The mortars and one-pounders were frequently used to support advancing infantry by direct overhead fire in much the same manner as machine guns.

The 37-mm. or one-pounder gun was introduced and also proved effective against machine-gun nests and, when supplied with special ammunition, was useful against light tanks.

Infantry Equipment.—In consequence of the successful development of the weapons above described, the equipment of a rifle squad in the United States Army in 1929 includes one automatic rifle and one grenade discharger. A howitzer company is assigned to each infantry regiment equipped with three light mortars and three 37-mm. guns.

Tactical Value of Tanks. The value of tanks as an auxiliary arm of the infantry was demonstrated during the War. In the organization of the United States Army in 1924, one light tank company was included as an integral part of an Infantry Division. In 1928 the company includes a headquarters platoon with nine tanks, and three platoons each with five tanks, 10 armed with 37-mm. guns and 14 with machine guns. Light tanks are transported on trucks as close as possible to the battle front.

Other Changes in Tactics. The changes in infantry tactics were accompanied by some changes in artillery tactics, indirect firing being developed to a high degree of perfection. The interdependence of the infantry and the artillery was emphasized and close liaison between the two arms was found most important. In order to conceal battery positions from aerial observation, effective methods of camouflage were developed. The rolling barrage to precede the leading infantry waves in an attack was perfected and was made possible by a supply of ammunition such as never had been available before.

In defensive positions, the importance of field guns which could be rapidly advanced to bring direct fire on tanks was recognized, as was the desirability of accompanying guns to advance with the infantry to assist in reducing enemy strong points too heavily fortified to be destroyed by the infantry weapons.

Cavalry tactics were hardly affected by the War, as the conditions of warfare after the Battle of the Marne did not permit the utilization of cavalry to any important degree. It seems apparent that the future use of cavalry will be in open warfare largely as a screen for the movements of the armies and for reconnoissance in conjunction with the air service. Cavalry patrols can secure information by contact with enemy patrols and from captured prisoners which airplanes cannot obtain, while airplanes can quickly forward the information picked up by the cavalry as well as that which they obtain

by direct observation and aerial photographs.

The tactical value of leadership and morale, of training and discipline, of accurate, well-aimed rifle and machine-gun fire, of team work by adjacent units and of effective and reliable intercommunication was impressively revealed in the War. See **ARMIES AND ARMY ORGANIZATION**; **ARTILLERY**; **ORDNANCE**; **CHEMICAL WARFARE**; **WAR IN EUROPE**; etc.

STRATIGRAPHIC GEOLOGY. See **GEOLOGY**.

STRATON, JOHN ROACH (1875–1929). An American clergyman, born at Evansville, Ind., and educated at Southern Baptist Theological Seminary at Louisville, Ky. After being ordained to the Baptist ministry in 1900, he held pastorates in Chicago and Baltimore, and in 1918 was called to Calvary Church in New York City. He engaged in numerous controversies over modernism in religion, vigorously upholding the fundamentalist view. His writings include: *The Menace of Immorality in Church and State* (1920); *The Heavenly Home* (1920); *The Gardens of Life* (1921); *Church vs. Stage* (1921); *Our Relapse Into Paganism* (1921); *Dance of Death* (1922); *The Old Gospel at the Heart of the Metropolis* (1925); *The Famous New York Fundamentalist-Modernist Debates* (1925); *The Fakes and Fancies of the Evolutionists* (1925); and *Fighting the Devil in Modern Babylon* (1929).

STRATTON, GEORGE MALCOLM (1865– *). An American psychologist, born at Oakland, Calif., who was graduated at the University of California. He pursued graduate studies at Yale and Leipzig (Ph D. 1896) and was assistant professor, associate professor, and director of the psychological laboratory at the University of California until 1904. For four years, he was professor of experimental psychology at Johns Hopkins, and since 1908 has held the chair of psychology at the University of California. In the World War, he served as head of the psychology section, Medical Research Laboratory of the Air Service at Mineola, LI., with the rank of major. In 1908 he was president of the American Psychological Association. He was a member of the National Research Council (1921–24) and chairman of its Division of Anthropology and Psychology (1925–26). In 1928 he was elected a member of the National Academy of Sciences. He is advisory editor of the *Psychological Review* and the *American Journal of Psychology*. He wrote *Experimental Psychology and Its Bearing upon Culture* (1903); *Psychology of the Religious Life* (1911); *Theophrastus and the Greek Physiological Psychology before Aristotle* (1917); *Developing Mental Power* (1922); *Anger, Its Religious and Moral Significance* (1923), and contributions to journals upon perception of change, eye movements, the aesthetics of visual form, railway accidents and the color sense.

STRATTON, SAMUEL WESLEY (1861– *). An American physicist and university president, born at Litchfield, Ill. He was graduated at the University of Illinois in 1884, where in 1886 he became instructor of mathematics and physics and in 1889 professor of physics and electrical engineering. He was later called to the University of Chicago where he was professor of physics from 1898 to 1901, when he organized the United States Bureau of Standards at Washington; he was director of the Bureau until 1923. In that year, he accepted the presidency of the Massachusetts Institute of Technology. He served during the Spanish-American War in

the United States Navy with the rank of lieutenant. He was secretary of the committee for aeronautics and a member of the Executive Board of the National Research Council during the World War. The Elliott Cresson Medal of the Franklin Institute was conferred on him in 1912 and in 1917 he received the Public Welfare Medal of the National Academy of Sciences. Dr. Stratton became a member of the International Commission on Weights and Measures and in 1923 was a member of the United States Assay Commission.

STRAUSS, shtrous, RICHARD (1864–). A German composer (see VOL. XXI). During 1917–20 he was director of the Akademische Meisterschule für Komposition in Berlin. In 1919, without entirely severing his musical contacts with Berlin, he accepted the directorship of the Staatsoper in Vienna; but protracted absences on extended concert tours over all Europe, North America, and South America seriously interfered with his contractual duties and brought about general dissatisfaction. As a result, Strauss resigned in 1924 and did not conduct in Vienna again until 1926, when an agreement was reached that he was to direct only a limited number of performances as guest-conductor. After a triumphal tour of South America in 1920, he visited the United States the following year for the second time. With several of the great orchestras, he conducted his orchestral masterpieces, and with the assistance of other artists appeared as pianist in his own chamber music and songs. It is significant that, with the exception of the *Sinfonia domestica*, the programme offered only works written before 1900.

Although in recent years Strauss has been by no means inactive as a composer, he has produced nothing that reaches the level of his early masterpieces. Every work bears the impress of his powerful individuality, shows his marvellous mastery of all technical resources, but the irresistible melodious sweep, the flaming passion of the earlier works are missing. The case of Strauss stands absolutely without a parallel in the history of music in this respect, that a great career is cut short, not by death, but through lack of genuine inspiration. Even so, Strauss's place among the immortals is already assured. His great symphonic poems mark the culmination of programme music and have definitely decided in the affirmative the long debated question whether "programme music" can claim artistic equality with the older "absolute music." His achievements in the domain of the art song (*Kunstlied*) have secured for Strauss a place of honor among the immortal masters of song. Of his dramatic works, only one, *Der Rosenkavalier*, has maintained itself in the standard repertory.

The list of works given in the main article (VOL. XXI) is completed by the enumeration of the following: operas, *Ariadne auf Naxos* (2d version, Vienna, 1916; 3d version, Dresden, 1917), *Die Frau ohne Schatten* (Vienna, Oct. 10, 1919), *Intermezzo* (Dresden, Nov. 4, 1924), *Die ägyptische Helena* (Dresden, June 6, 1928; New York, Nov. 6, 1928); the ballets, *Schlagobers* (Vienna, 1924) and *Der silberne Schlüssel* (Pest, 1927); suite for orchestra, *Der Bürger als Edelmann*; *Parergon zur Sinfonia domestica*, a piano concerto for the one-armed pianist, Paul Wittgenstein; *Festhymnus*; *Hochzeitspraludium*, for the wedding of his son; *Drei Hymnen*, for solo voice

and orchestra; *Die Tageszeiten*, for male chorus and orchestra, for the Schubert Centennial (Vienna, 1928). Two operas, *Feuersnot* and *Ariadne auf Naxos*, had their American premières in Philadelphia (Dec. 1, 1927, and Nov. 1, 1928, resp.). Consult H. T. Finck, *Richard Strauss: the Man and his Works* (Boston, 1917); R. Specht, *Richard Strauss und sein Werk* (2 vols., Leipzig, 1921); H. W. von Waltershausen, *Richard Strauss* (Munich, 1921); R. Muschler, *Richard Strauss* (Hildesheim, 1925).

STRAVINSKY, stru-vin'ski, IGOR (1882–). A Russian composer, one of the leaders of modernism (see VOL. XXI). In 1925 he visited the United States, appearing in performances of his own works as pianist and conductor, but failed to leave a lasting impression as his vogue apparently had declined. The three ballets, *L'Oiseau de Feu* (1910), *Petrushka* (1911), and *Sacre du Printemps* (1913), which created a sensation at the time and established the composer's place as the leader of the modernists, still remain his highest achievement. In these works, spectacular stage-effects and brilliant orchestration cleverly conceal from the average listener the appalling poverty of musical invention. The juxtaposition or superposition of individual tones, unrecognizable as melodic or harmonic combinations, seems to be determined by chance or caprice. As a matter of fact, these later works have been performed only by organizations devoted to the propagation of modernistic music. The compositions include *Renard*, a burlesque (1917); the ballets, *Les Noces* (1917), *Pulcinella* (1920), and *Apollo Musagetes* (1928); a one-act opera, *Mayra* (1921, which failed of success); *Concertino*, for string-quartet (1923); a piano concerto (1924); *Oedipus Rex*, a scenic oratorio (1927).

STREERUWITZ, ERNST (1874–). A Chancellor of Austria, born in Mies, now Czechoslovakia. He was trained for a military career but left the army and, after further study at the University of Vienna, entered business as a textile manufacturer. During the World War, he held administrative posts in Vienna and afterward became known as one of the leading industrialists of Austria. He was elected to Parliament as a Christian Socialist in 1923, and succeeded Monsignor Ignaz Seipel as Chancellor in May, 1929. He was forced to resign five months later (September 25) when the Austrian Fascists disapproved of his conciliatory policy toward the Socialistic government of Vienna.

STREET CLEANING. See ROADS AND PAVEMENTS.

STREET RAILWAYS. See MUNICIPAL OWNERSHIP; ELECTRIC RAILWAYS, RAPID TRANSIT.

STREETS. See ROADS AND PAVEMENTS.

STRESEMANN, GUSTAV (1878–1929). A German statesman, educated at the universities of Berlin and Leipzig. When he entered the Reichstag in 1907, he was general manager of an important union of manufacturers, and was identified with the great industrial leaders, such as Hugo Stinnes, who were the mainstay of the German People's Party. He was at one time chairman of the Foreign Relations Committee. In August, 1923, he was asked to form a ministry in which he was also Foreign Minister. During the time he was in office, the Bavarian revolt occurred, and there was much disorder throughout Germany. He announced that the distress of the German people might be alleviated by a cessation of resistance in the Ruhr and the return

of the former Crown Prince. His views caused the downfall of his government in November, 1923, and Dr. Wilhelm Marx was asked to form a new cabinet. As Foreign Minister (1923-29) Dr. Stresemann reoriented Germany's foreign relations in a way that established his reputation as the country's leading post-war statesman. He effected the security pact with France, negotiated the Locarno Treaty, obtained the entry of Germany into the League of Nations on equal terms with the Allied nations, and in 1929 secured the promise of an early evacuation of Allied troops from the Rhine. He also played a leading part in the adoption of the Dawes Plan (1924), and in negotiations in 1929 for the substitution of the Young Plan for the Dawes Plan. In 1926 he was awarded the Nobel Peace Prize jointly with Aristide Briand. He died unexpectedly in Berlin Oct. 3, 1929, the morning after his intervention in the Reichstag had averted a Cabinet crisis over the unemployment-insurance law. See REPARATIONS; GERMANY, under *History*; LEAGUE OF NATIONS.

STREUVELS, STIJN (1872-). Pseudonym of Frank Lateur, a Flemish author, born in Heule, West Flanders. A baker at Avelgham

tive character of American trade-unionism, the strike as an economic weapon played a comparatively minor rôle. While there were strikes, during the period, characterized by much bitterness and of a protracted character, it may be said generally that they were resorted to but slightly by American labor. The high-water mark was reached in 1917; since that year the recession has been steady and marked. The following table of indexes, based on 1916 as 100, compiled by the U. S. Bureau of Labor Statistics, shows the relative number of disputes from 1916 to 1927.

TABLE I

Year	Relative number of disputes	Year	Relative number of disputes
1916	100	1922	29
1917	117	1923	41
1918	88	1924	33
1919	96	1925	34
1920	90	1926	27
1921	63	1927	19
		1928	17

Table II shows the number of labor disputes by years and indicates whether or not the workers involved had trade-union affiliation.

TABLE II.—RELATION OF WORKERS TO LABOR UNIONS

Relation of workers to union	Number of disputes											
	1916	1917	1919	1920	1921	1922	1923	1924	1925	1926	1927	1928

until 1905, he wrote stories in the West Flanders dialect and is one of the most distinguished contemporary Low Dutch authors. His writings include: *Die Oogst* (1900); *Duimpjesbundel* (1902); *Openlucht* (1905); and *De Vlaschaard* (1908), translated into English as *The Path of Life* (1915); *Het glornierijke Licht* (1912); *De landsche woning in Vlaanderen*, a study of Flanders architecture (1913); and *In oorlogstijd, Augustus 1914*, war narratives (1915).

STRIKES AND LOCKOUTS. A survey of labor disputes during the period since 1913 brings out two sharply contrasted periods: the war years, when efforts to promote patriotic coöperation between capital and labor reduced the number of strikes to a markedly low level; and the post-war period, when, with generally unsettled conditions and a diminished effort for arbitration, the number of strikes and the number of persons affected rose quickly in many countries, to a hitherto unprecedented figure, only to fall off again after 1920. An interesting experiment during the period was the effort of the Australian states to prohibit strikes and lockouts, although the original act did not prove satisfactory and was replaced in 1918 by a new measure which made strikes illegal only in certain specified industries and public agencies and where walkouts occur within 14 days after notice of intention to strike. Another interesting movement was the step taken by employers in Germany and the Scandinavian countries to insure themselves against strikes, as an offset, they claimed, to the protection that the worker had in his strike benefits. See PICKETING; SABOTAGE; and INJUNCTION.

United States. As a result of the conserva-

What were the principal causes of dispute? For the period 1916-17, strikes and lockouts for wages only accounted for 27 per cent of the total; hours only accounted for 3 per cent; recognition of trade union only accounted for 16 per cent; wages and other causes accounted for 48 per cent; hours and other causes accounted for 11 per cent; recognition and other causes accounted for 23 per cent.

Table III shows the number of disputes for which the number of employees was reported. It is significant to note the decline after 1919 and the particularly small number of strikes in the year 1927, as compared with 1919.

TABLE III.—NUMBER OF DISPUTES FOR WHICH NUMBER OF EMPLOYEES IS REPORTED, AND TOTAL AND AVERAGE NUMBER INVOLVED

Year	Number of disputes	Number of employees	Disputes in which number of employees is reported
			Average number of employees per dispute
1916	2,667	1,599,917	600
1917	2,325	1,227,254	528
1918	2,151	1,239,989	576

1928	656	17,997	27

An account of the more important strikes during the period under review follows. A strike marked by much violence occurred in 1913-14 among the Colorado coal miners, giving rise to several sanguinary conflicts and the burning of a tent colony in which 2 women and 11 children were suffocated. While the objects of this strike—better working conditions, 8-hour day, higher wages, and recognition of the union—were not gained after more than a year of struggle, a Federal investigation of the situation uncovered conditions at the mines which were obviously in need of remedy and the operators were threatened with Federal intervention if outbreaks continued to occur. In the same year, there were serious disorders in connection with a strike among the coal miners of West Virginia and the silk workers of Paterson. During the period immediately preceding the entrance of the United States into the War, strikes became numerous, partly because the workers sought to secure for themselves a share of the large war profits, in part because it seemed opportune to demand the betterment of conditions and, perhaps to some small extent, because of the activities of foreign agents. In 1916 four railroad brotherhoods and the railway representatives came to a deadlock. In the arbitrations that followed, President Wilson's plan, which was accepted by the men, was rejected by the railroads, this situation bringing about the passage of the Adamson Law, fixing the legal standard of a day's work at eight hours, and forcing the railroads to acceptance. During the War, in an organized effort to substitute mediation for the strike and lockout, thus obviating loss of time in that emergency, a Committee on Labor of the Advisory Commission of the Council of National Defense was formed in 1917, with Samuel Gompers, president of the American Federation of Labor, as chairman, and with subcommittees on various phases of the question, such as wages and hours, mediation and conciliation, welfare work, cost of living, and domestic economy. The Labor Adjustment Committee, consisting of three representatives each of the

Government, employers, and employees, was created, and immediately made itself felt in preventing threatened strikes in the West coast shipyards and among the East coast longshoremen; it finally effected a settlement of the strike in the copper mines of the Southwest. In connection with the latter strike, a wholesale, unauthorized deportation of miners—some of them members of the I.W.W. (q.v.)—from Jerome and Bisbee, Ariz., caused a great stir. About this time, a general disorganization of the lumber industry in the Northwest, by strikes, gained for the workers the 8-hour day. An outbreak among machinists engaged on war work at Bridgeport was, in spite of concessions to the workers, finally quieted only by an ultimatum threatening blacklisting of the men from all war work. This period, which had been one of comparative quietude, was broken by the Armistice.

In 1919 in Seattle, 25,000 shipyard workers went out, bringing on a general strike in that city which affected about 60,000 workmen. It was unsuccessful. When the Boston policemen in that year went out on strike to secure recognition of their union, their posts were filled by other men. Another unsuccessful attempt to compel recognition of a union was that of the steel workers, about 300,000 of whom walked out in September, 1919. Judge Gary refused to confer with the union leaders on the grounds that they were not representative of a large number of the workers. Federal troops were finally called in before the men returned to work. In New York City in 1919, there were actors' and longshoremen's strikes, and a printers' lockout. In that year, a strike among bituminous coal miners, affecting about 425,000 men, was called off after two weeks, and the difficulties settled after six weeks upon the terms proposed by President Wilson. There were 125 unauthorized strikes in 1919, affecting 1,053,256 men. Of the 4,154,733 workers who were involved in all strike movements in that year (1919), not less than 400,000 were in the clothing trades, 178,000 in textile work in New Jersey and New England, 330,000 in shipyards, 430,000 in the building trades.

The year 1922 was marked by a serious strike, which tied up practically the entire coal industry. For the first time, anthracite and bituminous mines were simultaneously affected. The walkout, following attempts to reduce wages, began on March 31. The bituminous strike ended August 15, the anthracite miners did not return until the beginning of September (see COAL). In August, 610,000 men were out. There was an outbreak of violence at Herrin, Ill., following the shooting of two union pickets by armed guards, 19 nonunion miners were killed and 30 wounded by an armed mob. Both bituminous and anthracite strikes were terminated by an extension of previous contracts from Mar. 31, 1922, to a date in 1923, and by agreements for further conference.

As a result of this situation, and fulfilling one of the conditions on which the men went back to work, in September, 1922, Congress created the United States Coal Commission for the purpose of investigating all phases of the production, transportation, and distribution of coal, and relationships between operator and worker, with a view to recommending remedial legislation. This year was notable also for the nation-wide strike among railway shopmen, involving 400,000 men and seriously tying up the entire transportation system. A strike of 155,000 anthracite miners in Pennsylvania in 1923 lasted only 10 days, the workers gaining a 10 per cent increase of wages but being denied the check-off and the closed shop. The pressmen's strike in New York City, September 18-26 of that year, was significant from the point of view of union discipline: the local union having defied the main authority body, its charter was canceled and the international organization supplied pressmen to fill the strikers' places.

One of the most serious strikes in the labor annals of the United States started on Sept. 1, 1925, when 158,000 coal miners in the anthracite fields downed tools. The strike area covered 500 square miles lying in Pennsylvania and West Virginia and the strike shut down 828 mines and 272 collieries owned by 135 companies. As a result of the strike, the price of anthracite mounted from \$14 to \$30 a ton by Jan. 1, 1926. Not until Feb. 18, 1926, did a settlement come and then it ended in a compromise over the issues involved (recognition of the union, wage increases, a 5-day week, spread over the work period). In 1926 the important strikes were largely left-wing in character. The textile strike of Passaic in 1926 was lead by a Communist and involved 11,700 workers. After lasting for almost a year, the strike was settled with the withdrawal of the Communist organizer, Albert Weisbord, and with the organization of the strikers into a craft union under the jurisdiction of the American Federation of Labor. The workers, however, were compelled to accept the 10 per cent wage cut that had been one of the leading reasons for the calling of the strike. In New York City in the same year, the furriers and the cloak- and suit-makers struck as a result of a struggle between the lefts and the rights for the control of their unions. The lefts for the time being succeeded in capturing the furriers' union after a particularly bitter struggle and won their outstanding demand for the 5-day week; but in the cloak- and suit-makers' strike, which involved 40,000 persons and lasted for half a year, the lefts were defeated and the International Union succeeded in disbanding the joint board in control. The strike almost ended in the breakup of the union. The bitterest strike in recent American labor history ended in July, 1928, when the bituminous mine workers returned to the mines with all their demands lost and the union practically wrecked. The strike had started in April, 1927, to enforce the Jacksonville scale of wages which the operatives were seeking to abandon in the central competitive field because of overproduction and the ruinous competition of the nonunion mines of West Virginia. Some 200,000 men, on the call of the United Mine Workers, downed tools in the States of Illinois, Indiana, Iowa, and Ohio, and in western Pennsylvania. In the midsummer of 1927, the miners of Indiana, Illinois, and Iowa had returned to the mines on the basis of the Jacksonville scale, leaving the miners in Ohio and Pennsylvania to carry on their losing struggle. The

strike was sanguinary and was characterized by a good deal of violence and bad blood. While the cause of the miners evoked much popular sympathy and even the United States Senate showed its approval of their position, it became evident as the year 1927 was drawing to a close that nothing could save the strikers. A minority group in the union tried to continue the strike, but to no avail. On July 18, 1928, the United Mine Workers gave its consent to the district unions to effect what agreements they could on the basis of the abandonment of the Jacksonville scale. In 1922 the United States Mine Workers had 500,000 members; it was computed that in 1928, at the end of the strike, only 100,000 members were left. How disastrously the strike had ended may be seen from the fact that the miners of Illinois were compelled to accept a wage scale of \$6.10 (they had won the Jacksonville scale of \$7.50 in 1927), the Pennsylvania miners had to accept a scale of \$5, as did also the Ohio miners. The miners were completely under the thumbs of the operators with the spread of the open shop and the presence of a surplus of 100,000 miners in the industry.

On Apr. 16, 1928, the cotton textile operatives of New Bedford, Mass., called a general strike in reply to an announced wage reduction of 10 per cent. The workers refused to postpone their strike vote when the manufacturers promised to put off the wage cut and 25,000 operatives went out in 25 plants. Only one-third of the strikers were reported to be unionized. After a terrible struggle of 25 weeks, on October 6, the unions voted to return to the shops with a wage cut of 5 per cent but the promise of a 30 days' notice of future wage reductions.

In 1929 a series of strikes broke out in the textile-mill districts of Tennessee, North Carolina, and South Carolina as a result of the efforts of the A. F. of L. and Communist organizers to bring about better living conditions in the South's new industrial areas. Many of these strikes, particularly in Gastonia and Marion, N. C., were accompanied by bloodshed. The strikes were generally unsuccessful. Public opinion, however, was aroused against the cruel "sweating" of men and women in these new mill towns.

Canada. The labor history of Canada indicated a state of industrial peace very similar to that existing in the United States. For example, in 1927 the time lost in strikes and lockouts was less than in any year after 1915 and the number of employees involved was less than in any year since 1916. No single strike in 1927 involved more than 5000 employees nor did any strike lose more than 50,000 working days. In 1927 there were 79 strikes in progress in which 22,683 workers were involved and in which 165,288 days were lost. This state of affairs may be compared with the year 1919 (the stormiest since 1913), when 208 strikes involved 138,988 workers and in which the total number of days lost was 3,942,189. For 1913 the figures had been 113 strikes, 30,536 workers, and 1,287,678 days lost.

See GREAT BRITAIN and GERMANY, under *History*, for accounts of the great strikes in these countries during the post-war period. The English general strike as a result of the strike of the coal miners, is treated in detail.

STRONG, BENJAMIN (1872-1928). An American banker, who was born at Fishkill-on-Hudson, N. Y., and attended public schools at Montclair, N. J. After serving as a bank clerk in New York

City for several years, he was made secretary of the Atlantic and of the Metropolitan Trust companies. In 1904 he became secretary of the Banker's Trust Company, later, vice president, and in 1914, president. He was the first governor of the Federal Reserve Bank of New York, holding that office from November, 1914, to his death in 1928. As chairman of the open-market-investment committee, he was influential in formulating the Federal Reserve policy during the trying years of the World War and after Federal Reserve loans that he had an important part in initiating helped greatly to stabilize financial conditions in Poland, Germany, England, Belgium, France, and Italy. He was made a member of the French Legion of Honor in 1919 and was awarded the highest rank in the Order of Polonia Restituta in 1927.

STRONG, WILLIAM WALKER (1883-). An American physicist, born at Good Hope, Pa. He studied at Dickinson College and at Johns Hopkins. He was a Carnegie assistant in physics at Johns Hopkins and during 1911-13, professor of electric theory at the University of Pittsburgh. In 1913 he became president of the Scientific Instrument and Electric Machine Company. During the World War, he developed a gas mask, and in 1921, discovered the effect of magnetic psychoanalysis. In addition to many papers contributed to scientific journals, he wrote *The Absorption Spectra of Solutions* (2 vols, 1910-1911), *The New Science of Fundamental Physics* (1918); *The New Philosophy of Modern Science* (1920); and *Immortality in the Light of Modern Thought* (1923).

STRUCTURAL GEOLOGY. See GEOLOGY.

STRUCTURALISM. See CONSCIOUSNESS AND THE UNCONSCIOUS.

STRUMPELL, sht'rum'pel, ADOLF (1853-1925). A German physician, who specialized in internal medicine and neurology. In 1883 he wrote the first edition of a textbook on general medicine, *Lehrbuch d. spez. Pathologie und Therapie*, which up to 1926 had passed through not less than 25 German editions and had been translated into French, English, Russian, and Turkish. He also published, not long before his death, *Leitfaden für die Untersuchung und Diagnostik der wichtigsten Nervenkrankheiten* (1924); and an autobiographical work, *Aus dem Leben eines Deutschen Kliniker* (1925).

STRZYGOWSKI, JOSEF (1862-). An Austrian art historian, who was educated at the universities of Vienna, Berlin, and Munich. He was director of the first Art Historical Institute at the University of Vienna and was an honorary member of the British Society for the Promotion of Hellenic Studies and of the Royal Institute of British Architects. His works include *Orient oder Rom* (1901); *Altai-iran* (1917); *Die Baukunst der Armenier und Europa* (1920); *Krisis d. Geisteswissenschaften* (1923); *Der Norden u. d. Bildenden Kunst Westeuropas* (1926); *Forschung und Erziehung* (1928); *Die Altslavische Kunst* (1928). Also the English works, *Origin of Christian Church Art* (1923); *Early Church Art in Northern Europe* (1927).

STUART-JONES, HENRY (1867-). A British classicist (see VOL. XXI). He was a member of the Council of the British Academy (1918-21) and of the Hebdomadal Council at Oxford (1920-27). From 1920 to 1927, he was a fellow of Brasenose College and Camden professor of ancient history at Oxford. Since 1927 he has been principal of the University College of

Wales at Aberystwyth. His later works include *Fresh Light on Roman Bureaucracy* (1920); chapters in *The Legacy of Rome* (1923); and the *Cambridge Ancient History*.

STUCK, FRANZ VON (1863-1928). A German painter (see VOL. XXI), who was born in Munich, and studied at the Academy there. His allegorical figures and groups are characterized by great dramatic power. He was professor at the Academy of Munich, member of the Munich, Berlin, and Vienna Secession, the Academies of Dresden, Milan, Antwerp, and Stockholm, and the Société de Peinture et de Sculpture of Paris.

STURTEVANT, ALFRED HENRY (1891-). An American zoologist, born at Jacksonville, Ill. He was educated at Columbia University. In 1915 he became research associate of the Carnegie Institution of Washington. He collaborated with Morgan in extensive researches on genetics, especially of the fruit fly, and published a number of papers dealing with the taxonomy and genetics of this insect. He was joint author (with Muller, Bridges, and Morgan) of *The Mechanism of Mendelian Heredity* (2d ed, 1923).

STYRIA, stîr'î-a. A province of the Republic of Austria. Its area in 1910 was 8658.4 square miles, in 1923, 6323 square miles. Its population in 1910 was 1,441,157, in 1923, 978,845. See AUSTRIAN REPUBLIC.

SUBLIMATION. See CONSCIOUSNESS AND THE UNCONSCIOUS.

SUBMARINE CHASER. See VESSELS, NAVAL.

SUBMARINES AND THEIR WAR ACTIVITIES. The use of the submarine boat as a commerce destroyer was not a part of Germany's original plans for the War. The U-boats which had been completed and tested before the outbreak of the War were so unsatisfactory that Admiral von Tirpitz, the German naval chief, was highly skeptical as to their usefulness. Their first cruises against the British forces, in which 2 out of 10 were lost without inflicting any damage on their adversaries, seemed to confirm his views. Few new boats were ordered, and no special effort was made to hasten their construction, but on Sept. 22, 1914, Lieutenant Weddigen in the U-9 sank in one hour a whole division of three 12,000-ton armored cruisers (*Aboukir, Hogue, and Cressy*), with a loss of 1400 men. The effect of this achievement was instantaneous, both in England and Germany. The British Navy had made no definite plans to combat submarine activity. Extremists like Admiral Sir Percy Scott declared that no adequate measures were possible, extremists of the opposite view considered the submarine too ineffective to require such plans. Von Tirpitz was converted at once, not only was he converted, but he soon became the leading advocate of submarines in Germany. New boats in great numbers were ordered, and the earlier ones were taken in hand to remove their defects, as far as that could be done.

While this work was going on, the idea of using submarines against shipping was quickly conceived and developed. It was estimated that by Feb. 1, 1915, the repairs to the old boats would be completed and a number of the smaller new ones would be ready for service. On February 4, the Germans declared that the waters surrounding Great Britain and Ireland would be a war zone in which enemy merchant ships would be destroyed, and that it would not always be

possible to avoid danger to passengers and crew and even to neutral ships. Owing to a sharp protest from the United States, the declaration was modified in regard to neutral ships, their neutral character to be judged by all circumstances and not simply by the flag carried. As thus changed, it was put into effect on February 18.

After the sinking of a number of cargo and fishing vessels, the British passenger steamer *Falaba*, bound to Sierra Leone, was torpedoed on March 27 with the loss of 100 lives. On May 7, before the storm of protests which this evoked had died down, the great passenger liner *Lusitania* was torpedoed without warning and sank in 20 minutes with a loss of life at first reported as 1396 but afterward thought to be about 1200. Nearly 300 Americans were on board, and many were drowned. The protests over the *Falaba* affair were as nothing compared to those now aroused. The United States was deeply stirred and came near to declaring war against Germany, but the country was unprepared for war and did not even start to prepare for it until 1917, after war was admitted to be inevitable.

The American protests were met by the usual German promises, though even the Chancellor was convinced of the danger of making an active enemy of the United States, and on June 15 an imperial order was issued, forbidding the sinking of large passenger vessels. Von Tirpitz and the naval staff fought the order so furiously as to somewhat weaken imperial support of it. Encouraged by this, the naval instructions to submarines were apparently relaxed; for on August 19 the large British passenger steamer *Arabic*, outward bound, was sunk off the Irish Coast with the loss of 44 lives. The United States again protested strongly, and the German government apologized, quoting the statement of the submarine commander that the *Arabic* was apparently trying to ram him, and also repeating (September 2) their previous assurance that liners would not be sunk without warning and without safety of the lives of noncombatants, provided that the liners did not try to escape or offer resistance. Two days later, September 4, the liner *Hesperian* was sunk with the loss of 32 lives. The German government denied that she was destroyed by a submarine, but the proof seemed clear.

During the year, the Germans sank various American cargo vessels for which they agreed to pay. The Chancellor now forced Von Tirpitz to stop sinking liners, and on September 20, further orders were issued, suspending operations except in the North Sea. This condition of affairs remained unchanged until after the close of 1915, notwithstanding the arguments and protests of Von Tirpitz and the naval staff; but on Feb. 12, 1916, the German government issued a memorandum declaring that after February 20, merchant vessels armed with guns would be treated as belligerents. On March 24, the channel steamer *Sussex*, with 325 passengers, about 25 of them Americans, was torpedoed. Though it was not sunk, 80 persons were killed or injured. Following this, President Wilson threatened to break off diplomatic relations altogether, "unless the German government should now immediately declare and effect an abandonment of its present methods of submarine warfare against passenger and freight-carrying vessels." The German reply concluded with the statement that German naval forces had received an order that vessels

would not be sunk without warning and the saving of life unless they should attempt to escape or offer resistance; but if the United States failed to secure the "freedom of the seas" from Great Britain, the "German government would then be facing a new situation in which it must reserve to itself complete liberty of decision." Although this proviso made the promise as to methods of warfare absolutely valueless except for the brief interval before Germany would decide that the United States had not obtained from Great Britain the "freedom of the seas"—an impossible absurdity—it was accepted by the President, who said he would "rely on a scrupulous execution henceforth of the now altered policy."

Fear of American hostility, or doubt of its success, held Germany back from unrestricted submarine warfare until the beginning of 1917, when the naval staff persuaded the government that it would be so effective as to starve the British people until they demanded peace. Fears of the United States were declared groundless. That country had evidently no warlike intentions, for it was wholly unprepared for war, and nothing of importance was being done to remedy this situation. The American political campaign of 1916 had been won on an anti-war platform by the aid of pacifists and pro-Germans and, as late as December, the President had made a speech in which he told the people not to lose their heads over talk of preparedness. "Moreover," the naval staff said, "the submarines would stop any attempts to transport troops to Europe before Great Britain was brought to her knees." A note to the Allies on December 12, proposing negotiations for peace, was rejected by them, and on Jan. 9, 1917, it was decided to commence unrestricted warfare on February 1. The new decision was publicly announced on January 31. While other areas were added later, the rough outlines of the war zone, as defined by the announcement, within which submarine warfare was to be unrestricted, included all north European waters between the meridians of 4° E and 20° W longitude, and between the latitudes of the Faroe Islands and Cape Finisterre, except over narrow lanes along the coasts of Holland and Spain, the zone also included all the Mediterranean except areas along the Spanish coast and a lane 20 miles wide leading to Greece. The last phase of the blockade was now reached. The United States at once broke off diplomatic relations with Germany. On February 3, the American Ambassador left Berlin and on the same date the German Ambassador at Washington was handed his passports, but the declaration of war was deferred until April 6 in the futile hope that Germany would rescind her decree.

Germany had now about 140 submarines ready for service and many more building, 269 were ordered in 1917 and the construction work on submarines and destroyers was pushed to the limits of the shipyard capacity. The total tonnage of Allied and neutral merchant vessels sunk during each month increased from 291,000 in January to 464,000 in February; 507,000 in March, and 834,000 in April. The tonnage sunk in May dropped to 549,000. In June, it was 631,000; in July, 492,000; in August, 489,000; in September, 315,000; in October, 420,000; in November, 259,000; and in December, 350,000. During 1918, it steadily decreased, with slight fluctuations, to 106,000 in October. Sixty-six German submarines were sunk in 1917 and 74 in 1918. In the early days of unrestricted warfare, the anti-submarine forces

were inadequate in number for either patrol or convoy, but this number grew steadily, and the system of patrol and convoy was soon vastly improved. Depth bombs were supplied in constantly increasing quantities, and methods for their discharge were perfected. Aircraft became more and more valuable, especially for sighting submarines when submerged. Allied submarines increased in number and gained in effectiveness. Decoy vessels (Q-ships), P-boats, sub-chasers, sloops, trawlers, mine sweepers, booms, mine fields, paravanes, camouflage, and zigzag steering played their parts; but the most important vessels in the antisubmarine service were the destroyers, and the most effective system of protection was the convoy.

The first division (six boats) of American destroyers arrived at Queenstown on May 4, 1917, and, within the next 30 days, three similar divisions joined them. Not only did they greatly help to relieve the strain on the British forces, but news of their appearance on the blockade 28 days after the declaration of war was most inspiring to the Allies and more than equally depressing to the Germans. Before American troopships began to reach the danger zone in great numbers, many more American destroyers, together with patrol vessels, submarines, and cruisers, had joined the Allied forces, so that the rush of troops during the spring and summer of 1918 was so effectively guarded as to surprise not only the United States and its Allies but also the Germans, who had confidently expected to prevent absolutely the transport of any great number of troops and their supplies, and who were chagrined and alarmed by their complete failure.

The work of the British and French submarines during the War was less advertised than that of the German boats but was very important. Scouting in the North Sea, the Baltic, the Adriatic, the Aegean, and in the Black Sea and its connecting waterways—the Dardanelles, Sea of Marmora, and the Bosphorus—were of the utmost value to the Allies aside from the destruction of the enemy's surface vessels and submarines. Some of the cruises of British submarines were among the finest feats of the War, afloat or ashore. The Italian submarines were few in number but did good work. The same may be said of the American boats that reached Europe in time for important use.

SUBWAYS. See RAPID TRANSIT.

SUDAN, sūd'an', ANGLO-EGYPTIAN. An African territory under the joint administration of Great Britain and Egypt, lying between Egypt and Uganda and the Belgian Congo, and extending from the Red Sea to the limits of Wadai in central Africa. Area, 1,008,100 square miles; population, estimated in 1928, 6,469,041. The chief towns are Khartum, the capital (31,965), Omdurman (79,238), Khartum North (14,319). Gun arabic continues the product of greatest economic value. In 1913, 33,353,393 pounds were exported (value, £E371,528); in 1927, 21,239 tons were exported (value, £E680,887). Cotton ranks second with an estimated production in 1926-27 of 130,000 bales (478 pounds each); in 1927-28 the estimated production was 110,000 bales. Other products include durra (millet),

sesame, cattle, and ivory. In 1913 total exports were £E1,185,186; in 1920, £E4,712,652; in 1927, £E5,229,420. Imports for 1913, 1920, 1927, were £E2,109,476, £E7,006,865, £E6,155,310. Imports, in 1927, included cotton fabrics, iron and steel manufactures, sugar, coal, machinery and hardware, flour, etc. Great Britain easily leads in Sudan's foreign trade, buying over three-fourths of its exports and supplying nearly one-third of its imports.

It was seen by the Sudan government that only great irrigation projects could open up the country for economic exploitation. The two areas which have received attention are the Gezira district, between the White Nile and the Blue Nile, and the Tokar district in the Red Sea province. In the former, a project was commenced in 1914 for the opening up of about 300,000 acres by the construction of a dam on the Blue Nile, at an estimated cost of about £6,000,000. This project was put into operation in 1925. At the same time, the Egyptian government proposed to construct a dam on the White Nile below Khartum, for the use of its own lands. Work was commenced on this scheme in 1919 but was discontinued for lack of funds in 1921. The work on the Makwar (Blue Nile) dam continued; by 1922, it had cost £4,000,000. In 1928 there were 1728 miles of railway in operation. To facilitate communications, the British erected 16 wireless stations in the Sudan. The cost of government consistently increased. For 1913 and 1927, revenues were £E1,568,352 and £E5,929,945; expenditures for these years were £E1,533,065 and £E5,550,489. The budget for 1928 balanced at £E5,978,000. Surpluses from revenue were accumulated in a reserve and expended on public works.

The Sudan enjoyed the period of prosperity that was prevalent in all noncombatant countries during the World War. The rise in prices, the demand for cotton and gum, and the presence of large British forces in Egypt, accounted for the economic well-being. This state of affairs was reflected in the comparative peace that attended the British occupation. In 1916 the confines of the territory were extended to take in the whole of Darfur, which was incorporated as the fifteenth province of the Sudan. This was occasioned by the rebellion of the Sultan Ali Dinar who, working with the insurgent Senussi, contemplated an invasion of the Sudan. As a result of the conquest, Great Britain and France were able to settle the troublesome frontier question of Wadai and Darfur (1919). During the period of the War, military forces were in continual operation in the southern provinces, notably Mongalla and Nubia, because of local uprisings. The Sudan was little affected by Egyptian troubles (1919-23) and though Egyptian nationalism sought to include the Sudan in its aspirations, there was very little positive sympathy displayed by native Sudanese. The British government steadily refused to permit the new Egyptian state to absorb the Sudan (see EGYPT). In 1924 Egyptian troops were evacuated and a new Sudan Defense Force, owing allegiance to the governor general, was created.

SUDERMANN, zōd'ēr-man, HERMANN (1857-1928). A German dramatist and novelist (see VOL. XXI). He wrote *Das Bilderbuch meiner Jugend* (*The Book of My Youth*) (1922). The World War called forth the dramatic trilogy, *Das deutsche Schicksal* (1921). His last novels, *Der tolle Professor* (1921) and *Die Frau des Steffen Tromholt* (1927), and his play *Der Hasen-*

fellhandler (1927) showed a decline of his powers.

SÜDFELD. See NORDAU, MAX SIMON.

SUEZ CANAL. The strategic importance of the Suez Canal for military purposes during the World War and the steady increase in traffic in subsequent years necessitated a programme of widening and deepening its waterway to take care of the increasingly large vessels which were passing through annually. Improvements were, therefore, carried out in accordance with plans made in 1921, to increase the minimum depth to 42 feet 6 inches, the minimum bottom width to 196 feet 8 inches, to reduce the curves, and increase the width at many points, especially at the curves, beyond the minimum standard; much of the canal bank was lined with stone to prevent washing, and at Port Said the breakwater was extended to prevent the silting up of the entrances.

Previous to the War, the traffic through the canal was about 21,000,000 tons annually, but during the War it declined to between 13,000,000 and 14,000,000 tons. By 1923, however, it had surpassed all previous records, and continued to increase until in 1928 it had reached unprecedented activity, in number of ships, net tonnage of ships, gross tonnage of merchandise, and receipts. In the latter year, passages of ships totaled 6084, their net tonnage 31,906,000, gross tonnage of merchandise 32,622,000, and receipts 222,396,000 gold francs, the latter item showing an increase of over 6 per cent above the previous high record set in 1927.

Considering the total net tonnage passing through the canal in 1927, southbound traffic accounted for 13,567,000 tons and northbound traffic for 15,398,000 tons. Southbound traffic in 1927 consisted principally of such commodities as metals and machinery, railroad materials, coal, cement, salt, fertilizers, textiles, petroleum, wood pulp and paper, and refined sugar, while the principal northbound commodities were cereals, amounting to 3,417,000 tons, mineral oils, 3,158,000 tons; oleaginous products, 3,138,000 tons; textiles, 1,864,000 tons; rubber; tea, and sugar cane. Australia figured prominently in shipments of wheat; Persia, in shipments of mineral oils, and Vladivostok and Dairen, in shipments of oleaginous products. Motor-vessel navigation through the canal showed a steady increase and amounted to 12.3 per cent of the total transits in 1927, a large increase over the previous year. Passenger traffic also showed a marked gain in 1927, especially in the southbound passages, the total passengers being 340,318.

SUEZ CANAL TONNAGE AND RECEIPTS,

* In thousand tons

* In thousand gold francs.

In 1927 the Suez Canal Company announced a reduction of 0.25 franc in canal tolls, effective

Apr. 1, 1928. From that date, tolls were collected at 7 gold francs per net ton Suez Canal measurement for laden ships, and at 4.50 gold francs for ships in ballast. (One gold franc equals \$0.193.) In 1884 the rate per net ton was changed to 10 francs for laden vessels and 7.50 francs for ships in ballast. From that time until Jan. 1, 1913, there was a gradual decline in rates, from 6.25 francs for laden vessels and 3.75 francs for ships in ballast. Then the rates were increased, until on Jan. 1, 1918, they were made 8.50 francs for laden vessels and the same for ships in ballast. From this time there was a gradual decline in rates until those mentioned above were adopted.

The Compagnie Universelle du Canal Maritime de Suez reported net profits for 1928 totaling 713,000,000 francs, against 659,000,000 francs in 1927. Dividend was declared on the 800,000 shares of 250 francs nominal par value, of which Great Britain holds 353,000 shares, amounting to 510 francs a share, compared with 455 francs in 1927; with the exception of 103,000 shares upon which capital had been repaid, which received 503 francs, against 448 francs. The 100,000 founders' shares received 585 francs, against 522 francs paid in 1927.

SULLIVAN, EDMUND J. (1869-). A British illustrator. He was born in London, educated at Mount St. Mary's College, Chesterfield, and studied art in Hastings under his father. He was on the staffs of the *Daily Graphic* (1890-92) and the *Pall Mall Budget*. His work is represented in the New York Public Library and in public galleries in Melbourne, Vienna, Barcelona, and Rome. He wrote *The Art of Illustration* (1921) and *Line, an Art Study* (1922).

SULPHUR. Few discoveries in the field of chemical engineering were of greater significance than that of the Frasch process by which the sulphur deposits of Louisiana and Texas could be exploited in an efficient and economical way. In 1900 the domestic output of sulphur in the United States was valued at only about \$500,000, and the demands of the industry were met by imports of sulphur and pyrite, or by native supplies of the latter substance. In 1902 came the successful development of the new process, and the production of sulphur has increased remarkably since then. The amount of sulphur mined and shipped, together with the value of the shipments in the interval from 1914 to 1927, is given in the accompanying table.

U. S. SULPHUR PRODUCTION

Year	Sulphur mined Long tons	Sulphur shipped Long tons	Value
1914	417,699	341,985	\$6,214,000
1915	520,582	293,803	3,955,000
1916	649,683	766,835	12,247,000
1917	1,134,412	1,120,378	23,987,000
1918	1,353,525	1,266,709	27,868,000
1919	1,190,575	678,257	10,252,000
1920	1,255,249	1,517,625	30,000,000
1921	1,879,150	954,434	18,000,000
1922	1,830,942	1,343,624	24,000,000
1923	2,036,097	1,618,841	26,000,000
1924	1,220,561	1,537,345	25,000,000
1925	1,409,262	1,858,003	29,000,000
1926	1,890,057	2,072,687	37,300,000
1927	2,111,618	2,072,109	38,800,000
1928 *	1,981,873	2,082,924	37,500,000

* Estimated.

The year 1927 was the first since the closing down of the sulphur mine in Louisiana in 1924, that the production of sulphur has been equal to or larger than the shipments. Over 99.9 per cent of the shipments in 1928 was made by two companies in Texas, whereas more than 99.9 per cent

of the shipments was made by these companies and the company in Louisiana which was still shipping from stocks. Production and shipments of sulphur also were made by two other mines, one in Nevada and one in Utah.

The development of the American sulphur industry not only had peculiar significance in the United States but it was a very vital matter for Italy. In 1906 the Sicilian production was 475,553 metric tons and, with the development of the American mines, it was realized that the Italian industry was seriously threatened by the United States, as Italy was the only serious competitor of this country. An agreement between the American and Sicilian sulphur producers regulating the world's unrefined sulphur market was concluded early in the spring of 1923. Prices were to be regulated in relation to the demands for consumption, with an intention of gradually regaining the pre-war levels based on a gold standard, and to be increased by \$1 a ton over those temporarily put into effect in October, 1922. North America was to be supplied by the American producers, Italy by the Sicilian producers, and the remainder of the world proportionately by the two groups, with the provision that Sicilian producers might sell to any country a maximum of 65,000 tons for the manufacture of sulphuric acid.

This agreement permitted Sicily to export annually 210,000 tons, including 65,000 tons for sulphuric acid, a quantity largely in excess of Sicilian exports up to 1923. Since 1923 Sicilian exports have constantly exceeded the quota allotted under the 1922 agreement. In 1927 a new basis of agreement was reached, whereby the Italian industry was allowed more liberty in export markets, with the result that total exports of Italian sulphur showed a decided increase in 1927 and a further increase was estimated for 1928. The Sicilian production together with that of all Italy, is indicated in the accompanying table

SICILIAN AND ITALIAN PRODUCTION OF SULPHUR		
Year	Sicilian Production Metric tons	Total Italian Production Metric tons
1914	334,974	377,843
1917	177,453	211,847
1918	194,585	234,296
1919	181,744	226,126
1920	224,247	263,603
1921	240,089	273,872
1922	137,640	191,600
1923	206,238	256,342
1924	241,156	294,899
1925	207,998	263,590
1926	208,741	273,791
1927	231,440	297,646

SUMMERALL, CHARLES PELOT (1867-). An American army officer. He was born at Lake City, Fla., and graduated at West Point (1892). Entering the Army as second lieutenant, he served in the Philippine campaigns of 1899-1900 and was with the China Relief Expedition of 1900-01. He located and began the construction of Fort William H. Seward in Alaska in 1902. From 1905 to 1911, he was senior instructor in artillery tactics at West Point. During the years 1913-17, he was lecturer at the Army War College. In 1917 he located field artillery training camps at Anniston, Ala., and Monterey, Calif., and from April to July of that year, he was a member of the military mission to

England and France. Joined the A. E. F. in France in October, 1917, having been made a brigadier general of the National Army, and in 1918 commanded, in succession, the 1st Division and the 5th Army Corps (until after the Armistice). In 1919 he commanded the 9th Army Corps and the 4th Army Corps as a brigadier general of the Regular Army. Besides serving on various special missions, he was a member of the Inter-Allied Military Commission at Fiume and was on duty with the American Mission to Negotiate Peace to Aug. 31, 1919. He was in command of Camp Taylor, Ky., and Camp Dix, N. J. (1919-21), being promoted to the rank of major in 1920, and from 1921 to 1924 commanded the Hawaiian Department. After commanding the 8th Corps Area and the 2nd Corps Area, he became Chief of Staff of the U. S. Army in 1926. In the World War, he was awarded the Distinguished Service Medal and decorated with the Distinguished Service Cross (U. S.) for gallantry at the Battle of Soissons with the 1st Division. He also received the Victory Medal of the United States for his work in five major operations of the A. E. F.

SUMNER, FRANCIS BERTODY (1874-). An American zoologist, born at Pomfret, Conn. He was educated at the University of Minnesota and at Columbia University. He was instructor at the College of the City of New York (1899-1906), director of the biological laboratory of the United States Bureau of Fisheries at Woods Hole (1903-13); as well as biologist at the Scripps Institution for Biological Research (1913-19); associate professor of zoology (1919-26) and professor since 1926 at the University of California. In 1927 he also became research associate of the Carnegie Institution of Washington. He published extensively on the development of the bony fishes, on the fauna of the Woods Hole region, and more recently on the influence of environment on, and heredity of, the coat color of various mammals.

SUNDAY-SCHOOL UNION, AMERICAN. An organization formed in 1817 as the Sunday and Adult School Union by members of various religious denominations for the purpose of establishing and maintaining Sunday schools, and circulating religious publications. The work of the Union is carried on chiefly in rural districts where there was little church organization, and among Negroes in the South. During the year ending Mar. 1, 1929, missionaries established 673 new Sunday schools with 20,929 pupils and 2180 teachers, compared with 1368 new schools with 47,008 pupils and 4886 teachers during the year ending Mar. 1, 1915. In communities in which Sunday schools had been discontinued, the Union reorganized 515, with 14,790 pupils and 1655 teachers, in 1928-29, compared with 687, and 21,357 pupils and 2287 teachers in 1914-15. From these schools, there developed in 1928-29, 28 churches of various Protestant denominations, 12 of which erected church buildings, as against 86 churches with 27 buildings in 1914-15. In connection with the Sunday schools, 130 preaching stations were established in 1928-29. The Union was also responsible in the year first mentioned for the organization of 168 young people's societies, and 258 prayer meetings, having sponsored 155 societies, and 346 meetings in the latter year. In order to interest the country people in church work, missionaries paid 198,081 visits in 1928-29, as against 188,652 in 1914-15.

Besides publishing 12 Sunday-school periodicals, or 1,835,006 copies, the union issued in 1928-29, 285,925 copies of religious books and school pamphlets. Missionaries distributed 12,449 Bibles, Testaments, or Gospels in 1928-29, as against 24,529 in 1914-15.

Two new features of the union have developed recently, first, the organization of all-day group gatherings, bringing together rural Sunday schools. In 1928-29, 422 such gatherings were held with an attendance of 75,775 persons. Another development has been the Daily Vacation Bible School work, which has proved as practicable in rural communities as in cities. During the season of 1928, 528 such sessions, with an enrollment of 15,605, were held, meeting daily, usually for a period of two weeks. The president of the union in 1929 was E. Clarence Miller, National headquarters are at 1816 Chestnut Street, Philadelphia, Pa.

SUN YAT-SEN, sŏon' yat-sĕn', (1867-1925). A Chinese revolutionary leader (see Vol. XXI). When Yuan Shih-kai died in 1916, Dr. Sun headed a group of Cantonese who fought against the party in power, and in 1921 he was elected President of the Southern Chinese Republic. In 1922 the commander-in-chief of his army revolted and he fled to the foreign concessions in Shanghai, returning to power in Canton in 1923. He was reported to have made an active alliance with the Bolsheviks, which cost him most of his foreign sympathy. On Mar. 12, 1925, he died in Peking, where he had gone to attend a conference of the leaders of the different sections of China, with the hope of procuring peace by alliances between the sections. In 1929 his body was taken to Nanking and buried with state honors in an impressive mausoleum on Purple Mountain above the city. See CHINA.

SURFACE, FRANK MACY (1882-). An American biologist and economist, born at Eaton, Ohio. He was educated at the State University of Ohio (A.M., 1905) and at the University of Pennsylvania (Ph.D., 1907). He was associate biologist at the Maine State Experiment Station (1907-10 and 1913-17); biologist at the Kentucky Experiment Station (1910-13); assistant chief statistician of the Division of Food Inquiry (1917-19), and chief statistician of the American Relief Administration (1919-20). Since 1923 he has been in the service of the U. S. Department of Commerce, becoming in 1926 assistant director in charge of domestic commerce. He wrote *The Stabilization of the Price of Wheat during the War* (1925); and *American Pork Production in the World War* (1926).

SURGEONS, AMERICAN COLLEGE OF. An association or guild organized in 1913 by some 500 surgeons of North America representing every branch of surgery. The purpose of the college is to improve the standard of surgery, as well as

that of the competency and character of the practitioners of surgery, and to educate the public and the profession to understand that special training is demanded and that the surgeon elected to fellowship in the college has had such training. Membership, therefore, is on the basis of merit only and applicants for fellowship are examined with reference to professional ability and moral and ethical fitness. Each applicant must submit 1000 case records, of which 50 must be complete records of major work which he has done himself and 50 may be case histories in abstract. The membership grew from 500 in 1913 to approximately 8000 in 1928, and included outstanding surgeons in the United States, Canada, and the Latin-American countries.

Among the activities of the organization are clinics held at the annual meeting of the Clinical Congress of Surgeons of North America and at sectional meetings where the work of visiting and local surgeons may be observed. In 1917 the college began its hospital standardization programme which by 1927 had been extended to include a careful survey of 2581 hospitals of 35 beds and over, and of these 1803 or 69.9 per cent were fully or conditionally approved. The library and literary research of the college was organized to further the standardization of literature on surgery and closely allied subjects and to encourage a wider reading and study of scientific material. A staff of research workers was maintained to compile medical and surgical bibliographies and to abstract and translate from foreign languages. Thus, the accumulated thought and experience of surgeons writing in many languages and on any specified subject was placed before fellows of the college whose time for reading was very limited. The most recent responsibility assumed by the college was an extensive programme for medical motion-picture films for use in teaching for the profession, for nurses, and the laity. The president of the organization in 1928 was Dr. George D. Stewart, of New York City, and the director general, Dr. Franklin H. Martin. *Surgery, Gynecology and Obstetrics* is the official journal of the college, and its headquarters are at 40 East Erie Street, Chicago, Ill.

SURGERY. As a result of the World War, there was a certain amount of reversion to first principles in post-bellum surgery. Whether such reversion was beneficial is another matter. Surgery in 1929 may be an improvement in some ways over surgery in 1914, but is such improvement due necessarily to military experiences? Thousands of crippled children and adults owe their condition in part to lack of organization and equipment, special hospitals, and vocational training schools. It should be possible after ordinary traumatism and infantile paralysis—to go no further—in the interest of salvage, to save 10 per cent of the victims if the requisite apparatus could be guaranteed. As a result of war experience, we know that proper first aid often prevents crippling. One of the chief lessons from the War had to do with splints and splinting, the latter requiring team work among the surgeons. In all locations in which accidents have a cumulative incidence, splints are now kept on hand in sufficient amount, while attempts at standardization of splints and splinting have been patterned successfully upon military surgery. In routine surgery, splints are adjusted with the principal object of prevention of deformity, yet this must at times antagonize the principle of wound treatment.

The Carrel-Dakin solution which proved of such value in war wounds, as well as the other methods in vogue for wound treatment, are naturally antagonistic to the principle of fixed dressings intended to avert deformity; and until the two forms of treatment can be brought in harmony with each other, the status of wound treatment will be unsatisfactory. Some form of compromise must be forthcoming; permanent splinting must not be allowed to interfere with wound drainage. Stiffness of joints after immobilization will not be due to the treatment but to the original injury. The extremely radical methods of cleansing infected war wounds are not required in peace surgery and would be unnecessarily drastic.

Advances in surgical principles are necessarily slow and concerned largely with minimizing the risks of capital operations, especially in subjects already in peril from injury. Here, to the dangers of traumatic shock are added those of operative shock. To diminish the risk of shock and to prevent post-operative complications is the desideratum of all operating surgeons. The dangers of anesthesia in these subjects supply an additional element of risk. The condition known as acidosis, as interpreted by certain urinary findings, has been made a contra-indication to the use of general narcosis and some surgeons will not intervene until the urinary findings are normal. It is claimed that the danger of post-operative embolism is increasing and that it may be due to too indiscriminate intravascular injections of substances of many kinds. Recently, two new resources have been added for the prevention of shock, of which one is diathermy, as practiced in the Cleveland Clinic, and the other is the addition of insulin to the ordinary solution of dextrose, as carried out in the New York Hospital. One unit of insulin is added to three grains of dextrose and 1000 cubic centimeters of saline infusion. While it is impossible, as a rule, to prove anything in these cases by figures, there is the conviction on the part of the beholder that the results are worthy of the effort. See ABORTION, ANEMIA; ANGINA PECTORIS; CANCER; GALLSTONE DISEASE, WOUNDS.

SURINAM. See GUYANA.

SUTHERLAND, GEORGE (1862-). An American jurist and legislator (see Vol. XXI). He served as United States Senator from 1905 to 1917, but was defeated for reelection in 1916. He was appointed by President Harding to the United States Supreme Court in 1922. He is the author of *Constitutional Power and World Affairs* (1919).

SUTRO, ALFRED (1863-). A British dramatist. His education was acquired at the City of London School and at Brussels. His plays include *The Cave of Illusion* (1900); *Foolish Virgins* (1904); and *Freedom* (1916). He has produced many dramas in London.

SUTTON, SIR J. BLAND. See BLAND-SUTTON, SIR JOHN.

SVALBARD. (SPITSBERGEN). An Arctic archipelago of about 25,000 square miles lying between 76° and 80° north latitude and between 10° and 30° east longitude. It includes the West Spitsbergen, Prince Charles Foreland, Northeast Land, Barents Island, Edge Island, King Karl Island, Swedish Foreland, Abel Island, and Hope Island. Discovered in the twelfth century by a Norseman, this island group was rediscovered in 1596 by Barents, visited by Hudson in 1607, and became the scene of a lucrative

whaling industry in the seventeenth century. In the course of time, its whaling, fishing, and fur resources became practically depleted. For this reason, the problem of sovereignty which had been unsettled when the European whaling industry had centered there was allowed to lapse until the discovery and exploitation of high-grade coal deposits rendered it again a vital problem. On Feb. 9, 1920, a treaty which vested sovereignty in Norway was signed by the Versailles Treaty Powers. Since many countries had participated in the discovery and exploitation of this archipelago and since its coal had been mined by different nationals since 1904, all signatories to the treaty have mining, hunting, fishing, and trading privileges. A Danish Commissioner is appointed to examine disputed claims. Norway officially took possession on Aug. 14, 1925, and reestablished the former name of Svalbard.

It has been estimated that there are in West Spitsbergen 8000 million tons of coal of which 1500 million tons are of excellent quality. Mining activities are centered in Ice Fiord, where there are six camps of English, Norwegian, Swedish, Russian, and Dutch companies. The total yield of the mines was 4500 tons in 1910 and 313,000 tons in 1927. Although this industry is handicapped by having to import all supplies and export all coal in the summer season, decided advantages are present in the form of accessibility, use of galleries instead of shafts, freedom from the use of mine props, long daylight, and easy ventilation. Seven settlements have grown up on the west coast—Longyear City with a population of 529 is the largest. Kings Bay is known as the base for most of the aerial expeditions in the Arctic Sea. The total population numbers about 1500 in the winter and is larger in summer. Numerous wireless stations are maintained and there is regular postal service.

A large amount of research has been accomplished and excellent maps have been prepared of Svalbard. Norwegian explorers have been particularly active. Oceanographic studies were aided by the Prince of Monaco. Iron ore, asbestos, alluvial gold, gypsum, and marble are some of the minerals discovered. The Oxford University Expedition of 1924 mapped much of the east coast of Northeast Land and was the first to use an airplane for detailed Arctic exploration. The Norwegian government has recently established a commission to regulate exploration in Svalbard.

SVEČENSKI, LOUIS (1862-1926) An American violinist, born at Esseg, Croatia. After completing his studies at the University of Agram, he won a government scholarship and attended the Akademie der Musik at Vienna, where his teachers were J. Grun for violin and J. Hellmesberger for composition (1881-85), while among his classmates were Franz Kneisel and Fritz Kreisler. Having been brought to the attention of Gericke, then conductor of the Boston Symphony Orchestra, he settled in Boston as one of the first violins of the orchestra, and remained until 1903. When Kneisel organized his famous quartet in 1886, Svečenski became the viola player and held this position without interruption until the dissolution of the organization in 1917. In 1904 he joined the faculty of the Institute of Musical Art, in New York, retaining this post until his death. From 1924, he also conducted the class in chamber music at the Curtis Institute of Music in Philadelphia. He published *Twenty-five Technical Exercises for Viola*.

ŠVEHLA, ANTONÍN (1873-). A Prime Minister of Czechoslovakia. A member of the Bohemian Diet in 1908 and leader of the Republican Party in Bohemia before the World War, he became head of the National Revolutionary Committee in Prague during that conflict and was a member of the Constitutional Assembly in 1918. In the new Czechoslovak state, he became leader of the Agrarian Party and was Minister of Interior (1918-20), a member of Parliament (1920-), and Prime Minister (October, 1922-September, 1929). The Conservative Coalition government, of which he was the head, was considerably weakened by Socialist gains in the elections of December, 1928, and he was forced to resign the following September.

SWANSON, CLAUDE AUGUSTUS (1862-). A United States Senator (see Vol. XXI). He was reelected to the Senate from Virginia in 1916, 1922, and 1928. He has been a member of the Senate committees on expenditures in executive departments, foreign relations, naval affairs, public buildings and grounds, and rules.

SWARTHMORE COLLEGE. A nonsectarian coeducational institution at Swarthmore, Pa., founded in 1864. The student enrollment increased from 434 in 1914 to 540 in 1928. During this period, the board of managers voted to limit attendance to approximately 500 students. To the college library of 60,000 volumes there was added the Friends' Historical Library, and in 1926 Clement M. Biddle donated funds to erect a building to house this library. The Sproul Astronomical Observatory was completed in 1915 and two swimming pools were added to the gymnasium. In 1920 Hicks Hall of Engineering was built. The Cloisters, a group of six fraternity and nonfraternity club houses, were opened in 1925 and Worth Dormitory for girls was completed in 1924. Beginning in 1925, the General Education Board awarded the college an appropriation of \$250,000 over a period of five years for the development of honors courses in order to afford a thorough test of the possibilities of honors courses as an educational system for exceptional students in American colleges and universities. In 1927 a gift of \$300,000 from the Clothier family was received for an auditorium in memory of Isaac H. Clothier, and social buildings, including a memorial for Elizabeth Powell Bond, former dean, were erected. The physics research laboratory of the Bartol Foundation of the Franklin Institute was built in 1928. In that year, productive funds of the college amounted to \$3,700,000. President, Frank Aydelotte, LL.D.

SWAZILAND, swi'zè-länd'. A British native protectorate in South Africa under the control of the British Colonial Office and administered by a resident commissioner under the direction of the high commissioner for South Africa. It has an area of 6705 square miles and a population, by the census of 1921, of 112,838, of which 2235 were Europeans. The main concern of the administration is the expropriation of monopolies and concessions which had been granted to whites by the Swazi chief, Mbandeni. The public debt amounted to £55,000 in 1927. Swazis were settled on land reserves which amounted to about one-third of the total acreage in the protectorate. The costs of administration increased from £63,967 in 1913-14 to £103,681 in 1927-28. Native taxes, customs, sales, leases, concession rents, and licenses furnish the revenues, which totaled £90,706 in

1927-28. The people are largely a pastoral folk and export oxen and hides to the Cape. Live stock in 1927 numbered: cattle, 350,000; horses, 1000; and sheep and goats, 200,000. Recent experiments with tobacco and cotton by white farmers are meeting with success. Tin mining is important, the yield in 1927 being worth £42,776. Gold production in the same year was 1135 ounces, valued at £4,795.

SWEDEN, swê'dn. A kingdom in northern Europe with an area of 173,154 square miles. Its population (1928 and 1913) was 6,087,923 and 5,638,583, of which the urban population comprised 1,929,713 and 1,485,840. The chief cities and their population were (1928 and 1912) Stockholm, 464,699 and 350,955; Gothenburg, 233,303 and 173,875; Malmö, 117,197 and 92,338; Norrköping, 60,671 and 46,674; and Helsingborg, 53,371 and 33,863.

Agriculture. The proportion of the population engaged in agriculture decreased from 70.9 per cent in 1900 to 55.8 per cent in 1920. In 1929 there were in Sweden 9,534,200 acres of land under cultivation, 2,280,000 acres of permanent meadows, and 60,746,000 acres of forests and pastures. The total value of the crops in 1928 was \$309,004,000 and in 1927, \$302,032,000, of which hay represented \$84,143,000, oats, \$44,924,000; potatoes, \$30,839,000. In 1920 there were 2,736,000 cattle, 1,011,000 swine, 1,568,000 sheep, 113,000 goats, and 728,000 horses. The following table gives the acreage and production for 1913 and 1927.

Crop	Area (thousands of acres)		Production (thousands of units—bushels, except as indicated)	
	1909-1913	1927	1909-1913	1927
Wheat	255	104	8,103	11,298
Rye	977	849	24,101	18,726
Barley	448	415	15,035	12,472
Oats	1,956	1,803	86,050	78,895
Mixed grain	430 *	653	312 * ^b	467 ^b
Potatoes	377	390	57,580	39,252
Sugar beets	78	101	904 ^b	991 ^b
Hay	3,010 *	3,036	4,062 * ^b	5,076 ^b

* 1911-1915 average

^b Unit, metric ton.

The 1928 production (in tons) was: wheat, 529,878; rye, 435,947; barley, 208,358; oats, 1,268,769; mixed grain, 474,258; potatoes, 1,793,085; sugar beets, 1,096,002; fodder roots, 2,895,458; and hay, 5,334,372.

Mining and Industry. In 1927 there were 2855 wood and lumber mills (1248 in 1912) employing 100,770 workers (37,908 in 1912). Wood-pulp production (1927) was valued at \$26,795,384. The coal supply is small and insufficient for the requirements, production during 1927 being 398,298 metric tons. Sweden is, however, very highly developed electrically, utilizing its waterfalls for the production of motive power. Sweden disposed of approximately 1,557,000 developed turbine horse power. In 1927 there were produced 9,661,000 tons of iron ore, 417,765 tons of pig iron, 486,900 tons of steel ingots, 398,000 tons of coal, 400,000 tons of cement, 1,558,000 tons of chemical wood pulp, 601,000 tons of cardboard and paper, 184,358,000 cigars, 42,500 tons of margarine, and 20,975 tons of cotton yarn. In 1928 the iron and steel industry was more active, producing 417,000 metric tons of Martin steel ingots (371,400 in 1927); 80,200 tons of crucible and electric steel (53,100 in 1927); 413,000 tons of rolled and forged steel and iron (338,800 in 1927). Pig iron production dropped from 417,800 tons in 1927 to 393,100 in 1928. At the end of 1928, there were 148 fur-

nances in operation as compared with 131 in 1927.

Transportation and Communication. The length of railroad line at the end of 1927 was 10,110 miles, of which 3877 miles were state owned, and 6233 were owned by private companies. In 1913 the total length of state and privately owned lines was 8933 miles. In 1926 both classes of lines carried 65,862,000 passengers and 37,742,000 metric tons of freight, and had gross receipts of \$90,276,000. On Jan. 1, 1928, the Swedish merchant marine consisted of 2522 vessels, 909 of which were 200 tons or over. Their total capacity was 1,477,692 gross tons. In 1927, 29,791 vessels of 16,253,000 net registered tons entered the ports of Sweden, and 29,772 vessels of 16,235,000 tons cleared. In 1927 there were 3796 post offices, 49,010 miles of telegraph wire, and 532,739 miles of telephone wire (466,787 instruments).

Commerce. Swedish exports (1928 and 1913) were valued at 1,566,933,692 and 817,347,000 crowns; imports, 1,680,077,986 and 846,538,000 crowns.

In 1927 Swedish foreign trade reached record quantity figures, and was exceeded in value only during the abnormal years 1919 and 1920. Import and export values, as compared with 1926, increased 65 per cent and 14 per cent, respectively. Average import prices, principally by reason of mineral oils and coal, dropped about 10 per cent, as compared with 1926, while the reduction in export prices was only about 3.3 per cent. The chief imports were wheat, fruits and nuts, coffee, yarn and cordage, coal, mineral oils, iron and steel, machinery, and automobiles; chief exports, wood pulp, wood, wood manufactures, paper, iron ore, and machinery. The United States supplied 127 per cent of the imports, and purchased 10.9 per cent of the exports, Germany, 30.6 and 16.8; United Kingdom, 16.7 and 28.0; Denmark and Norway, 10.7 and 10.9.

Finance. On Jan. 1, 1929, the state debt stood at 1,831,862,476 crowns. The budget proposal for 1928-29 balanced at 744,746,400 crowns. In 1927-28 revenue totaled 749,792,858 crowns, and expenditures 739,829,701. The exchange rate was generally around par during the period (26.8 cents). The cost of living, which, in July, 1920, reached 270 (as based on the 1914 prices at 100), dropped to 236 in July, 1921, and 171 in December, 1927.

History. The outbreak of the World War occasioned an immediate declaration of neutrality by Sweden, in company with the other Scandinavian countries, and in this she persisted to the end. Her position was a difficult one, and the Swedish people displayed extraordinarily good sense in circumventing the vexing problems which arose. In the beginning of the War, it appeared that Sweden's economic stability would be little deranged, for she at once became the go-between for Germany and America. For a time, this trade flourished, but as the submarine campaign intensified and the British blockade became tighter, Sweden began to feel the pinch of necessity. From 1916 on, coal imports from Great Britain began to drop off seriously. The blockade was then not about Germany, but about the Scandinavian countries, for there were no means of ascertaining whether imports to Sweden were not designed for transshipment to the Central Powers. The result was that the suffering of the population was often acute. Measures had to be taken for the regulation of industry and conservation of what little food and raw material stocks Swe-

den had or was able to get. All exports were closely scrutinized and those of the more important domestic products prohibited; a financial moratorium was imposed; the Government was empowered to fix prices, hold up the sale of shipping, take in hand the whole matter of insurance, and resort to rationing. On this last score, the life of the greater part of the population was, of course, intimately touched. A food commission was set up to supervise the importation of foodstuffs and in 1915 it resorted to price-fixing. In 1916-17, sugar cards and bread cards were first employed, the bread allowance being generally 250 grammes per person per day. Other supplies rationed were potatoes, milk, and coffee. All such regulations were finally lifted in August, 1919.

Industry likewise suffered. In the activities dependent on the use of foreign raw materials, it was necessary to form import associations for the distribution of stocks. Before the end of the War, rationing was the rule in almost every industry. In the matter of fuel, for which Sweden depended on outside sources, the people were hard hit. It was necessary, therefore, to create a fuel commission, which undertook the exploitation of the country's forests on a grand scale. Mines and railways were kept going, but because prices charged were less than the cost of cutting, the Government had to assume a deficit of 100,000,000 crowns.

Sentiment regarding the War at first gravitated toward the Central Powers. The rigors of the British blockade had seriously interfered with the course of Swedish life, perhaps more profoundly than with those of the other Scandinavian peoples, and the Swedes adopted a more bellicose attitude toward the Entente. In 1916 debate in the Riksdag was very bitter, the Russian decision to fortify the Åland Islands particularly giving offense. Under the prompting of the military or Activist Party, the Riksdag passed a military appropriation of 104,000,000 crowns; but from 1917 on, the general attitude changed. A cabinet crisis on Mar. 5, 1917, precipitated the fall of the Hammarskjöld ministry, and the succeeding cabinets concerned themselves more and more with the problem of reaching an agreement with the Entente. The question became more pressing as food became scarcer and rioting more frequent. Finally, in February and in June, 1918, understandings were effected with Great Britain whereby Sweden was permitted to import stocks of food and such raw materials as phosphates, oils, coal, cotton, wool, rubber. In return, Sweden turned over part of her merchant marine to the Entente and guaranteed the export of her iron ores.

The unsettled economic conditions and the spread of democratic doctrines immediately after the War left their mark on the progress of Swedish events in the years 1919-24. By laws passed in 1919 and 1921, the Riksdag made the right of suffrage universal, women being given the franchise on May 26, 1919. In 1921 a national referendum law was passed. A question of greatest national interest was the discussion over the legalization of the eight-hour day in 1919. After a prolonged debate, the measure was defeated in the Riksdag with the result that the Chamber was dissolved and a new election held. The new Chamber proved more amenable to the Government's wishes and the law for an eight-hour day was carried. The prevalence of radical ideas was further indicated when the King was com-

pelled to summon Hjalmar Branting, leader of the Social Democrats, to form a government in 1920. An ambitious programme for the inauguration of inquiries into socialization of industry, expropriation of large estates, disestablishment of the State Church, and disarmament, was announced, but the Government went down to defeat in the autumn elections, as a result of heavy polls for the Right, and was compelled to resign. No temporary expedients or brave gestures could act as stop-gaps. The depression of 1920-21 which gripped the world was felt in Sweden, too, for in the general stagnation about 150,000 men were out of work at the end of 1921.

In the election of 1921, the Social Democrats made sweeping gains with the result that Hjalmar Branting formed a Socialist government for the second time. The continued disorganization of industry manifested itself in a growing turbulence and the years 1922-23 saw the country gripped by strikes in saw mills, wood-pulp factories, and iron works. The Franco-Belgian occupation of the Ruhr was another heavy blow to the Swedish iron industry. Representing only a minority party, the Branting ministry lacked the power to force through remedial measures, and on Apr. 6, 1923, it fell from office on the question of unemployment doles. A Conservative cabinet was then organized under Premier Ernest Trygger.

From the autumn of 1923 onward, the Swedish economic situation showed marked improvement. Sound public finance was reflected in a balanced budget and a decreasing public debt to which the Government added the enviable distinction of the earliest European return to the gold standard. The Riksbank resumed specie payments on Apr. 1, 1924. Under such circumstances, industry and commerce began to forge ahead. Hydroelectric underdevelopment was pushed; commercial aeronautics expanded phenomenally; the merchant marine thrived; bank deposits mounted steadily. The international balance of trade turned in Sweden's favor in 1927 and Swedish capital began to be invested abroad in increasing amounts. To cite but one instance, the Swedish Match Corporation secured a monopolistic position in France, Hungary, Portugal, Poland, Peru, Greece, Estonia, Latvia, Ecuador, Yugoslavia, and Rumania with ramifications in other parts of the world.

To a very considerable extent, Swedish political controversies came to revolve around the issue of national defense vs disarmament. The successful maintenance of neutrality during the World War had emphasized Sweden's independent attitude, but proximity to Finland and Russia involved her in questions of importance. The establishment of the Republic of Finland in 1917 divided Swedish counsels. There was a large body of opinion favorable to immediate recognition; another group, concerned over the ownership of the Åland Islands, advocated a more circumspect policy. In 1918 Finland was recognized, though Sweden refused to take sides in the internecine war between the Reds and the Whites which broke out in that year. The Åland Islands dispute was eventually submitted to the League of Nations in which Sweden had accepted membership. The League's decision (May, 1921) granting the islands to Finland was received with much disfavor and tested Sweden's pacific disposition to the utmost. Meanwhile, a Russian commercial delegate had been permitted to establish his residence in Stockholm and though in

1919 the unpopularity of the Bolsheviks forced his departure, Sweden categorically refused to join in the Allied blockade of Russia. Commercial relations were resumed in 1920. Late in 1923, newspaper criticism led to the resignation of Foreign Minister Hederström for advocating an alliance between Sweden and Finland against possible attack by Russia, and in May, 1924, *de jure* recognition was accorded to the Soviet régime.

Hjalmar Branting was an outstanding champion of the League of Nations, but early in 1924 his political opponent, Premier Trygger, expressed a lack of confidence in the League's ability to guarantee international justice and peace. No political party advocated complete disarmament, but a sharp struggle took place in the Riksdag over the general question of defense policy—the reduction and reorganization of the army, the maintenance of a strong navy, and the creation of an independent air-force board. The Government's army-navy bill passed the Upper House but was rejected in the Lower by a coalition of Social Democrats and Liberals in favor of a more drastic curtailment of expenditure. Deadlock between the two chambers led the Government to dissolve Parliament and appeal to the country. A bitter political campaign culminated in a relatively indecisive election (September, 1924); the Social Democrats winning 104 seats (gain of 5); the Conservatives, 64 (gain of 2); Liberals, 33 (loss of 8); Farmer's Union, 24 (gain of 3); Communists, 5 (loss of 2). The Trygger cabinet resigned (October 14), and Hjalmar Branting again formed a ministry of Social Democrats. Ill health compelled Branting to relinquish the Premiership in January to Richard Sandler, former Minister of Commerce, though he remained in the cabinet without portfolio until his untimely demise (Feb. 24, 1925), an event which threw all Scandinavia into mourning and was felt keenly throughout the world. Several months later (May 5) Branting's ablest lieutenant, Frederick V. Thorsson, Minister of Finance, likewise died, and with the passing of these two veterans the leadership of the Social Democratic Party devolved upon a younger generation.

After six years of debate, Sweden was the first continental European nation voluntarily to take an important step toward military disarmament. In the teeth of bitter and determined opposition from the Conservatives and Agrarians, the Social Democrats, aided by the Left Wing Liberals, carried their army-reduction programme, eliminating some eight infantry regiments, four cavalry regiments, and discharging some 8900 privates enlisted for long terms as trainees. Consideration of naval policy was postponed, but aviation was made an independent arm of the service.

Prospective lessening of military expenditures promptly created a new political issue: What to do with the saving? The Conservatives proposed tax reduction to lessen economic burdens. The Social Democrats advocated insurance against unemployment, but Carl G. Ekman, leader of the Left-wing Liberals (People's Party) would not support this project. On the other hand, the Social Democrats were decidedly antagonistic toward prohibition, the special measure of the People's Party, and reciprocal agreement on these two measures appeared improbable. In May, 1926, the crucial test came and the Sandler ministry resigned after being defeated on the unemployment-relief issue. Ekman, the outstanding personality in the Riksdag since the death of

Branting, now formed a minority cabinet (June 6) of Populists and Liberals. The new Government was committed to prohibition, but could hardly hope to carry such a measure without aid from other groups. The Social Democrats, embittered by Ekman's subversion of their cabinet, refused coöperation, whereupon the Premier effected a partial rapprochement with the Conservatives, modifying his former stand on army reduction and postponing the dissolution of some of the regiments. Although its position was considerably weakened by setbacks and compromises, the Ekman government managed to avoid outright defeat for over two years. A naval construction programme in 1927 caused a sharp cleavage in Social Democratic ranks, but sweeping educational reforms which were sponsored by the Government were carried through with their aid.

In an effort to regain power, the Social Democrats who had absorbed a few right-wing Communists in 1926 foolishly formed a close political alliance with the regular Communists for the election of 1928, but suffered a serious rebuff in consequence. The September balloting produced a Lower House with the following complexion: Social Democrats, 90 (loss of 16); Conservatives, 73 (gain of 8); Liberal Prohibitionists, 28. Agrarians, 27 (gain of 9), Communists, 8 (gain of 4), and Liberals, 4. On Sept. 26, 1928, the Ekman ministry resigned and shortly afterward ex-Admiral Arvid Lindman succeeded in organizing a new Government of Conservative tendency, which, however, barely survived the 1929 session of the Riksdag. Its proposal to increase the tariff on sugar met defeat at the hands of the Social Democrats once again in alliance with the Liberal Populists. A projected increase in military expenditures was similarly negated. Most serious reverse of all, a parliamentary storm forced the dismissal (June 7, 1929) of Finance Minister Wohlin, as a result of irregularities in his policy in connection with certain recent bank failures. The Lindman ministry emerged from the fray sadly damaged in prestige and with its future clouded with dubiety.

In the meantime, Swedish foreign policy moved steadily toward one goal—the achievement of international peace and security. A staunch supporter of the League of Nations, Sweden stood always ready to reinforce her covenant obligation though sedulously eschewing any "entangling alliance" (Repeated suggestions that Sweden enter into a defensive understanding with her Scandinavian sister states in a Baltic union were consistently opposed on the ground that such arrangements might be taken in an unfriendly sense by Russia.) Commencing with a renewal for 20 years of the compulsory arbitration treaty with Norway first signed in 1905 and now happily enlarged to cover all possible subjects of disagreement, the Swedish government proceeded to negotiate a whole network of virtually similar treaties not only with the remaining Scandinavian powers (Denmark and Finland) but with other countries as well, including Czechoslovakia (preliminary), Austria, Belgium (sweeping), Poland, France (limited), the United States of America, and Spain. In 1929 the Riksdag sanctioned Sweden's adherence to the Kellogg-Briand Pact.

SWEDENBORGIANS. See NEW JERUSALEM, CHURCH OF THE

SWEDISH LITERATURE. See SCANDINAVIAN LITERATURE.

SWEET BRIAR COLLEGE. A college for women founded at Sweet Briar, Va., in 1906, offering only liberal arts courses terminating in the A.B. and B.S. degrees. The number of college students increased from 74 in 1914 to 445 in 1928, and the faculty from 20 to 44. The library increased from 4100 to 16,000 volumes between 1914 and 1928 and the annual income from \$125,957 to \$402,559. In 1925 an administrative and academic building, a residence hall, and an infirmary were built; and a new library, a gift in memory of Mary Helen Cochran, was under construction in 1928. Enrollment in the college is to be limited to 500. President, Meta Glass, A.M., Ph.D., who succeeded Emilie Watts McVea, Litt D., LL.D., in 1925.

SWIMMING. Swimming as a sport has the distinction of leading the way in the matter of record-breaking year after year. Hundreds of new records come up for acceptance or rejection at the close of each season. This condition is due chiefly to the variations in the sizes of pools, necessary turns, and type of swimming involved. Increased speed and greater endurance, however, appear to characterize this sport more than any other each succeeding year, thus adding to the mass of new records claimed or listed. The world-wide interest gained by swimming competitions was emphasized in the 1928 Olympic Games in which 40 different countries participated. While the United States made practically a clean sweep of the events, the improvement shown by its rivals was most noticeable. Long-distance swimming has been featured by the many attempts, some successful, to negotiate the English Channel and by the Catalina Marathons off the coast of California.

SWINNERTON, FRANK ARTHUR (1884–). An English novelist and critic, born at Wood Green. His writings include *The Merry Heart* (1909); *The Young Idea* (1910); *The Casement* (1911); *The Happy Family* (1912); *George Gissing A Critical Study* (1912); *On the Staircase* (1914); *R. L. Stevenson: A Critical Study* (1914); *The Chaste Wife* (1916); *Nocturne* (1917); *Shops and Houses* (1918); *September* (1919); *Coquette* (1921); *The Three Lovers* (1922); *Young Felix* (1923); *The Elder Sister* (1925); *Summer Storm* (1926); *Tokefield Papers* (1927); and *A Brood of Ducklings* (1928).

SWITZERLAND, swit'sér-länd. A country of south central Europe. Its area is 15,940 square miles, of which 507 square miles are lakes of more than 25 acres in area, and 3072 square miles otherwise unproductive. Of the productive land, 3576 square miles were forests in 1921, 69 square miles in vines, and 8721 square miles in agriculture and mountain pasturage. According to the 1920 census, the population was 3,886,090, compared with 3,765,123 in 1910; estimated in 1928, 4,018,500. The largest cities in 1928 were Zurich, 222,900; Basel, 144,550; Geneva, 128,125; Berne, 109,850; Lausanne, 78,050; and St. Gall, 64,460. In 1920 the number of German-speaking persons in Switzerland was 2,750,022; French-speaking, 824,320; Italian-speaking, 238,544; Romansch-speaking, 42,940; and speaking other languages, 23,894. In 1913, emigration for overseas countries was 5787; in 1927, 5272. Switzerland is largely a Protestant country, although in 10 of the 27 cantons, including St. Gall, Lucerne, Fribourg, Tessin, and Valais, Catholics are considerably in the majority. There is, however, no State church, all denominations being supported by voluntary contributions. In

1920, there were 2,230,597 Protestants, 1,585,311 Catholics, and 20,979 Jews.

Education. In the school year 1927-28, there were 4407 primary schools, with 16,544 teachers and 473,865 pupils; 599 secondary schools, with 2341 teachers and 48,579 pupils; and 98 intermediate schools, with 684 teachers and 13,289 pupils. There were also supplementary professional, industrial, commercial, agricultural, and domestic-science schools. The higher professional schools (including also normal and arts and crafts schools) numbered 48, with over 32,000 students. The seven Swiss universities are located at Basel, Zurich, Berne, Geneva, Lausanne, Fribourg, and Neuchâtel, with 6526 students. The University Institute for International Studies was opened at Geneva in October, 1927.

Agriculture. Agricultural production in Switzerland was as follows

Crops	Area (thousands of acres)		Production (thousands of units—bushels, except as indicated)	
	1909-1913	1927	1909-1913	1927
Wheat	105	174 ^a	3,447	5,982
Rye	60	49	1,855	1,657
Barley	13	16	441	583
Oats	81	51	4,784	3,059
Potatoes	115 ^b	119	24,924 ^b	24,618
Grapevines	59	37	11,842 ^c	9,246 ^c

^a Maize and spelt included with wheat.

^b 1911-1913

^c Unit, gallon

In 1926 there were 1,587,000 cattle, 635,000 swine, 169,000 sheep, 287,000 goats, and 139,000 horses. Dairying is the most important branch of agriculture

Industry. Switzerland is an industrial country in spite of a lack of raw materials, the chief natural resource is water power. The total water power available was estimated at 2,699,336 horse power in 1914, of which 1,067,000 horse power was in use in 1925; water power was used principally by hydroelectric stations, and by the chemical and textile industries. At the end of 1927, there were 8163 factories in operation in Switzerland, employing 354,496 workmen. The principal industries in 1927 were machinery and appliances, with 61,485 workmen; cotton textiles, with 34,517; silk textiles, with 25,966; watch and jewelry manufacture, with 42,687; metallurgy, with 26,778; and foodstuffs and beverages, with 24,702. After the World War, many of the strongest industries, especially the machine industry, were greatly injured by competition with countries having depreciating currencies, and by the high cost of raw materials. The watch industry, however, was best able to meet competition and was, in 1929, in a flourishing condition. Unemployment, which was not a notable problem before the War, became very high in 1921, and reached a maximum in February, 1922, with 146,392 wholly or partly unemployed. A gradual improvement occurred with 35,314 in July, 1923, and with 13,701 at the end of December, 1927.

Commerce. Total exports during 1928 were valued at 2,134,000,000 francs, an increase of 111,000,000 francs, as compared with 1927; imports increased from 181,000,000 francs to a total of 2,744,000,000 francs. There was a good advance in exports of watches, machinery, dye-stuffs, aluminum, rayon, knitted wear, and shoes. Imports of textile raw materials declined 11 per cent in quantity, the loss applying chiefly to cot-

ton. Imports of manufactured goods increased 100,000,000 francs in value.

Finance. Budget deficits were not common and never large in Switzerland before the War. In 1913 expenditures were 192,000,000 and receipts 187,000,000 francs, with a deficit of 5,000,000 francs. By 1928 expenditures had risen to 347,490,000 and receipts to 338,230,000 francs, with a deficit of 9,260,000 francs. Unemployment subsidies and subventions to depressed industries, added to expenses arising from maintaining armed neutrality in the War, contributed to this deficit. The budget for 1929 called for revenues of 352,800,000 francs, and expenditures of 350,925,000 francs. The public debt of Switzerland on Dec. 31, 1913, amounted to 148,270,000 francs, by the end of 1921, it had increased to 2,063,360,800 francs, and by 1928, to 4,952,596,000 francs, including the debt of the federal railways. It was expected that the budget deficits would be eliminated within a few years, but the large amount of the public debt contracted after the beginning of the War, created a heavy burden for the Swiss taxpayer.

Communications. Water connections between Switzerland and other countries were unimportant, except by the Rhine from Basel, and internal waterways are not suitable for through navigation. Swiss railways are, therefore, of great importance to the country. They consist of a network of 2340 miles of standard-gauge line, of which 1820 miles are owned by the federal government. The financial condition of the Federal Railways, which was unsatisfactory after the World War, showed improvement, the year 1928 being the most favorable experienced since the War. Operating receipts in 1928 were 419,033,000 francs, as compared with 395,525,000 francs in 1927, while operating expenses were 254,016,000 francs, or only 3,000,000 francs more than in 1927. In 1929, 67 per cent of the total federal trackage was electrified, and it was estimated that 85 per cent of all traffic would be handled by electric locomotives during the year. The private railways have much less traffic than those of the Government. There were also, in 1926, 340 miles of tramways which carried a total of 188,440,000 passengers, and 30 miles of aerial mountain cableways, which transported 11,380,000 passengers.

History. Switzerland's position during the Great War was perhaps more difficult than that of any other neutral nation. Without a merchant marine and hemmed in on all sides by belligerents, her political and economic position could hardly be said to be of her own ordering. In the Swiss mind, there were two spectres ever present, the fate of Belgium and the very real danger of starvation.

Upon the outbreak of hostilities, the army was immediately mobilized for the preservation of the neutrality and territorial integrity of the country. Lessening fear of invasion, together with added financial burdens, led the Government from time to time to demobilize detachments of troops. Distress among soldiers' families occasioned governmental measures for relief, while private agencies contributed unstintingly to the same end. In all, the War cost Switzerland, in the defense of her frontiers, some \$200,000,000. In spite of very heavy taxation, recourse was had to numerous loans and the public debt of the Confederation increased about tenfold. It was not until late in 1920 that troops were definitely withdrawn from the frontiers and the regular

channels of communication once more thrown open generally.

Economically, the plight of Switzerland was equally wretched. The country was overpopulated and overindustrialized in proportion to its resources. Dependent on the Allies for foodstuffs and on the Central Powers for fuel, fertilizers, and raw materials, it was extremely difficult for the Alpine state to find a *via media* between the two groups. With the continuance of the War, the pinch of necessity was felt more and more acutely, and ultimately almost all necessities of life fell under the control of the central authorities to be rationed with greater or less parsimony. Certain industries flourished. Exports of embroideries, chemicals, silk yarns, wrought copper, iron forgings, and munitions mounted, for all belligerent states had an interest in keeping Swiss factories at work. Years of material privation and moral strain led to increasing social unrest. The year 1918 saw increasing friction between the Social Democrats and the federal government, culminating in a general strike on November 11-12, which temporarily paralyzed the economic life of Switzerland. The programme of the movement embraced such familiar objectives as proportional representation, woman suffrage, democratic reorganization of the army, a state-imposed 48-hour week, state social insurance, etc. The troops remained loyal and the strike collapsed after two days. It was in large measure an echo of the Russian and German revolutions.

There was no brighter page in European history during this tumultuous period than Switzerland's conduct toward foreign nationals voluntarily or involuntarily detained within her borders. In addition to temporarily stranded tourists, there were interned soldiers. Before the end of the War, at least 25,000 men of nations at war were being housed, fed, schooled, and set to work by Swiss authorities. To the Swiss Red Cross fell the work of exchanging prisoners and caring for the sick and wounded. The International Red Cross at Geneva tried to facilitate communications between belligerents, check the bombardment of hospital stations, and the like. More than ever, Switzerland became a centre of international activity. A whole series of Socialist conferences assembled there. See SOCIALISM.

Switzerland's rôle in international affairs assumed more significant proportions after the War. Continual protests against abject dependence upon her neighbors for communications with the outside world were finally headed by the Peace Conference in 1919 and she was given freedom of access to the sea via the Rhine, thereby paving the way for a merchant marine of tugboats and barges. The Gotthard railway convention of 1909, so obnoxious to Switzerland, was repealed. The agitation of German Austrians in the Vorarlberg Province for admission to the Swiss union was not successful largely on account of the reparations question, though many Swiss objected to the addition of 15,000 more German-speaking people to the already heavy German majority. In 1921, however, the Swiss Federal Council consented to the incorporation of the little Principality of Lichtenstein into the Swiss customs union (effective in 1923). Diplomatic and consular representation and the management of ports and telegraphs were also turned over to Switzerland. Switzerland's post-war relations with Germany and Austria were generally harmonious. Quite different was the case with re-

spect to Italy and France. Italian territorial ambitions had by no means been satiated by her success in the Tyrol. *Italia irredenta* likewise embraced the Swiss canton of Ticino and this had long been a source of conflict between the two countries. The ultra-nationalist Fascist Revolution in Italy therefore created many misgivings in Switzerland. Mussolini, it is true, officially discountenanced irredentist agitation and endeavored to consolidate Swiss-Italian friendship both economically and politically, but the steady growth of Fascist organizations on Swiss soil, particularly in Ticino, all well disciplined and blindly obedient to the Italian government, boded ill for the future. With France occurred a decade of dispute over the régime of the free-trade zones created about Geneva by the treaties of 1815. Denounced by the French government in 1918, they were (by Art. 435 of the Treaty of Versailles) made subject to negotiation between France and Switzerland. A convention of Aug. 7, 1921, gave Switzerland certain economic advantages but agreed to the advancement of the French customs line to the political frontier. Simultaneously a convention was signed providing for the abandonment of the Swiss claim to the military neutrality of Upper Savoy. Though approved by the Swiss Parliament, the Zones Convention was overwhelmingly rejected in a popular plebiscite on Feb. 18, 1923, by 410,227 to 92,541 votes. The Poincaré government, alleging bad faith and claiming authority under the Treaty of Versailles, took the unilateral step of abolishing the zones régime on Nov. 10, 1923. This action aroused great indignation in Switzerland.

After protracted negotiations, a new agreement was arrived at referring the controversy to arbitration by the International Court at The Hague. Tension was relaxed, but lingering bitterness in Switzerland was exacerbated by French maintenance of customs control and by the procrastination of the French Assembly in approving the arbitration agreement. Not until April, 1928, were ratifications exchanged. An arbitral decision was expected in 1929. Strained relations with her powerful Latin neighbors had meanwhile impelled Switzerland to overhaul her military training system and to modernize the equipment of her troops. With noncontiguous Soviet Russia, the Swiss government came into conflict because of the assassination on May 10, 1923, of Vorovsky, Russian plenipotentiary at the Lausanne Conference. Dissatisfied with Swiss handling of the matter, the Moscow authorities indignantly expelled numerous Swiss nationals from Russia and instituted an economic boycott. Switzerland retaliated by a similar embargo and the situation continued extremely strained until the conclusion of a protocol of adjustment at Berlin, Apr. 14, 1927, which, however, did not involve Swiss *de jure* recognition of the Soviet régime.

Most important of all factors in bringing Switzerland to international attention was the League of Nations, the seat of which was established at Geneva. Swiss statesmen evinced a keen interest in the new organization from the outset and endeavored to ensure the entry of their country. The chief question at issue was whether membership would be compatible with the perpetual neutrality of Switzerland which had just been reaffirmed by the Treaty of Versailles. After some months of doubt and the possibility of adverse action by the Supreme Council of the

Allies, the Swiss government finally succeeded in obtaining a decision of the Council of the League, Feb. 13, 1919, granting a special status to Switzerland. Then followed a hotly contested political campaign which ended in a narrow victory for the pro-League element (400,000 to 300,000) in the referendum of May 16, 1920. Swiss representatives, headed by M. Motta, participated usefully in successive assemblies of the League. Not content with joining the League of Nations and later accepting compulsory jurisdiction of the Permanent Court of International Justice, Switzerland concluded a score of arbitration treaties.

In common with other countries, Switzerland experienced a severe economic crisis during the post-bellum period. The world-wide movement for higher tariffs had an adverse effect on Swiss prosperity despite protective measures adopted by the Government. Unemployment, comparatively little in December, 1920, increased apace during the following year, the number of unemployed reaching 146,000 early in 1922. Special subsidies were granted to various industries—watch-making, dairying, embroidery-making, hotel-keeping, cereal- and stock-raising—and vast sums were expended for the relief of unemployment. Gradually, the situation began to improve. Unemployment was reduced and by 1928 the economic situation was generally satisfactory with industry, trade, and tourist traffic all doing well, though the international agrarian crisis was affecting Switzerland, causing great discontent among the peasantry and necessitating measures of relief. The intensive development of hydro-electric energy facilitated the electrification of railways and promised to make Switzerland independent of other countries for fuel, etc.

In the realms of politics and social development, Switzerland kept an even balance. Successive triennial legislative elections (1919-1922-1925-1928) registered little change in the relative position of the various parties, and not having a "parliamentary" system, the country was undisturbed by ministerial crises, but there was no lack of political agitation and controversy. The burdensome war debt and mounting governmental expenditures caused annual budgetary deficits. Since a special war-time general property and income tax re-authorized in 1919 failed to ameliorate the situation, the Social Democrats initiated a proposal for a practically confiscatory graduated capital levy, but this was decisively rejected by 790,584 to 109,484 votes in the plebiscite of Dec. 2-3, 1922. Any saving effected by cutting down normal running expenditures was immediately offset and even exceeded by ever-growing outlays called for by beneficiary and paternalistic legislation—unemployment relief, industrial subsidies, sickness and accident insurance, old-age pensions, etc. Nevertheless, Switzerland managed to maintain a stable currency, seceding from the Latin Monetary Union and considering the adoption of a gold standard. The woman-suffrage movement encountered obstacles and the prohibition movement experienced decided setbacks. Switzerland, laboratory of political experimentation along so many lines, seemed averse to these particular movements.

SYKES, SIR MARK (1879-1919). An English public official, born at Sledmere, Yorkshire, and educated at Cambridge. He served in the South African War in 1902 and became secretary to Sir George Wyndham in Ireland in 1904. In 1905 he went to Constantinople as attaché to the British Embassy. His knowledge of Meso-

potamia and Palestine proved invaluable during the World War, and he was sent on important special missions to Russia, Mesopotamia, and Syria. He also raised a battalion of the Yorkshire Regiment. His books include: *Through Five Turkish Provinces* (1900); *Dar-el-Islam* (1903); *Five Mansions of the House of Othman* (1909); *The Caliph's Last Heritage* (1915).

SYKES-PICOT TREATY. See MESOPOTAMIA; WORLD WAR, DIPLOMACY OF THE.

SYMONS, sim'onz, ARTHUR (1865-). An English poet and critic (see VOL. XXI). His later works include *Figures of Several Centuries* (1915); *Tragedies* (1916); *Tristan and Iseult* (1917); *Colour Studies in Paris* (1918); *The Toy Cart* (1919); *Studies in Elizabethan Drama* (1920); *Charles Baudelaire* (1921); *Translations from Baudelaire* (1925); and *Eleonora Duse* (1926).

SYNDICALISM. Syndicalism is a form of revolutionary socialism which, although based on the Marxian theory of the class struggle and of the failure of capitalism, repudiates the state, political organization and activity, and the ownership of the means of production by the state or any other political organization. Instead, it believes in strictly industrial organization and in the ownership of the means of production by groups of producers. It regards the industrial union as the unit of organization. Its aim, the industrial society, is to be composed of the aggregate of these coördinated industrial units. Control of production is to be vested in the workers. Toward that end, syndicalism employs revolutionary tactics: the general strike, direct action, sabotage, etc. See SABOTAGE. The Syndicalists take pride in possessing a hard realism which takes account of the existing situation, employs such methods as are required to attain a given end, and does not permit emotion to enter into the issue.

The years following the War were of marked importance for the Syndicalist movement. Although it suffered reverses in some countries, as in France, it made on the whole important forward strides. For the first time, efforts were made at international Syndicalist unity. A number of Syndicalist organizations were affiliated with the Red International of Labor Unions, organized at Moscow, July 15, 1920. In opposition to this body, because it was "not capable of organizing the revolutionary workers of the world into one compact fighting body" and was, moreover, an offshoot of communism, the strictly Syndicalist International Workmen's Association was established in Berlin, December, 1922-January, 1923.

The foremost Syndicalist organization in the United States was the I. W. W. (see INDUSTRIAL WORKERS OF THE WORLD). At the height of its power in 1923, the I. W. W. reported a membership of 58,000. Contrary to the general belief, the membership of the I. W. W. does not consist of foreigners but of native Americans of old stock. At the close of 1928, the organization occupied a rôle of minor significance in the American labor movement.

In France, the homeland of syndicalism, the Syndicalist movement weakened greatly and, after the outbreak of the War, its adherents became the minority in the General Confederation of Labor, instead of being, as before, the dominant group. This Syndicalist minority seceded in 1921 and formed the revolutionary General Confederation of United Labor. In England, the

Syndicalist movement had some strength during the latter part of the War. There existed a Syndicalist movement in Germany with a membership of 100,000, but it was very insignificant in comparison with the strength of the Socialists and Communists in that country. Italy had two Syndicalist organizations, the Italian Syndicalist Union and the Italian Union of Labor. With the appearance of Fascism, Italian revolutionary syndicalism disappeared. Italian Syndicalists, with the organization of the state into corporations, gave up Sorel's idea of violence and the class struggle, for Fascism's ideas of interclass solidarity and a united national front (See FASCISM.) There were also considerable Syndicalist elements in Spain, Canada, New Zealand, Australia, South Africa, and Argentina.

SYNTHOL. See CHEMISTRY, APPLIED.

SYPHILIS. In the period since 1914, our knowledge of this disease continued to increase in several directions. Historically, the attempts of the late Iwan Bloch to uphold the dogma that Old World syphilis was derived entirely from the American aborigines largely were set at naught. Even if the returned mariners of Columbus did become contaminated in America, and even if they did originate a focus of disease in Spain, there are no good reasons for doubting that the malady was already existent in the Old World. Medical history writing has made great advances in recent years and a new technique has developed. From the purely documentary side, it is difficult to uphold the existence of a great European epidemic of the disease late in the fifteenth century. The records of cities which, according to tradition, were ravaged by the disease, show no evidence in their archives of any unusual disbursement of public funds during 1495 and subsequent years. Students of old civilizations, such as those of Persia and Egypt, have pointed out that some of the modern folk designations of syphilis are of high antiquity. It is increasingly evident that the history of syphilis should be rewritten along purely scientific lines, paying little heed to old writers who wrote consciously of the disease on a basis of gossip and tradition.

The belief that syphilis prevails in proportion to the amount of commercialized vice which obtains in a given locality seems to rest on a fallacy of some sort. Since the disease has been reportable, there is no evidence of any notable falling off in its incidence, and a large proportion of fresh infections escapes record. New York City in 1924 was quite free from commercialized vice and had been free for some years previously; yet there was an average of 400 new cases reported every week, which means 20,000 annually, a figure which is no index of the actual number of new infections. In addition, the number of United States and Canadian youth infected in Europe is said to have been very large, fully justifying the use of the prophylactic measures which are often condemned unjustly as condoning vice.

The opinion gained ground during the World War that no opprobrium can be attached to medical authority when the efforts at prevention take place after the soldier has been exposed to the danger of contracting the disease. Neglect under such circumstances would be criminal. In regard to prophylaxis before the exposure, this has been well defended on economic grounds, because an infected soldier or sailor becomes a

charge on his command and must be interned and treated, and prevented from disseminating his disease; but all prophylactic measures whether undertaken before or after exposure, as well as all rapid and certain measures of treatment, have been attacked by moralists as inciting to further immorality by withdrawing the discipline of punishment.

The enormous vogue of salvarsan in the treatment of syphilis is best shown by the fact that the discovery by United States chemists during the War of how to make this German proprietary is said to have netted the United States government half a million dollars from the sale of the drug to consumers through distributing firms.

In speaking of the persistence of syphilis despite the abolition of officially or otherwise segregated vice districts, a word must be said as to the effects of prohibition, which it was hoped would work favorably against the spread of the disease. Many cases of infection were formerly directly traceable to intoxication, and it was often claimed that commercialized vice could not flourish without alcohol. Nevertheless, as already pointed out, the incidence of the disease does not diminish in large cities; and either prohibition does not prohibit, or diffusion of the disease is only slightly affected by alcoholic indulgence.

The chief interest in this disease of recent years lies in the domain of treatment. Salts of bismuth used hypodermically have attained an eminence but little inferior to mercury and the organic arsenicals. In cases which do not thrive under the older remedies, bismuth supplies a reserve. Potassium iodide, once regarded as a valuable remedy, is but little in evidence today in the literature of syphilis therapy. The sensational cure of paresis by malaria inoculation has been gradually extended to syphilis in general, although only after drug treatment has proved unsatisfactory. This form of treatment has been rather slow in reaching America, but has been in use at the Mayo Clinic for paresis and neurosyphilis in general since 1924. Among cases eligible for this treatment are those which are free from symptoms but have positive reactions in the cerebrospinal fluid. Apparently, in neurosyphilis with the exception of paresis, the drug remedies are first tested, but in the latter malady, drugs have always failed, so that malaria inoculation is used without delay. A substitute for the latter is typhoid vaccine, given purely because, like malaria virus, it produces fever. In some of the European clinics, the malaria treatment has been extended to the non-nervous forms of the disease and even to early cases, but the wisdom of this course is questionable.

SYRACUSE. A city of New York State. The population increased from 37,249 in 1910 to 171,717 in 1920, to 182,003 in 1925 (State census) and to 199,300 in 1928, by estimate of the U. S. Bureau of the Census. In 1926-27 the municipal boundaries were extended to include Eastwood, Onondaga, and Genesee Manor, and the population was increased by 10,732. The metropolitan area embraces the adjacent townships of Camillus, Dewitt, Geddes, Manlius, and Salina. The authority of the City Planning Commission was extended in 1923 to cover supervision of new developments in the outskirts of the city. Building construction has been active, reaching an estimated value of \$32,000,000 in 1927. The major building projects included two new hospitals, one

constructed by the city and the other to replace the old Syracuse Memorial Hospital; five office buildings, the Loew Theatre and Office Building, the State Tower, the Chimes, the Hills, and the New York Telephone buildings; and two new hotels. A school-building programme totaling \$2,500,000 has been carried out since 1924. In 1928 the city embarked on a 10-year improvement plan calling for an expenditure of \$35,000,000 in extending streets, sewers, and water mains. The principal feature was the construction of the Erie Boulevard, 56 feet wide, over the filled-in bed of the old Erie Canal. The municipal airport, covering 133 acres, has been established about 6 miles northwest from the centre of the city. In 1926 22,562 persons were employed in 414 industrial establishments of Syracuse and received \$32,195,917 in wages; the value of products manufactured was \$147,002,737. Bank clearings in 1928 reached \$347,594,000. The assessed valuation of property in 1927 was \$302,326,000; the net debt was \$24,248,000.

SYRACUSE UNIVERSITY. A coeducational institution at Syracuse, N. Y., founded in 1870 and fostered by the Methodist Episcopal Church, but nonsectarian in administration and policy. With the exception of the war years, the number of students registered increased steadily from 3933 in 1914 to 5430 in 1928. The faculty increased in the period from 300 to about 600 members and the library from 100,000 to 173,000 bound volumes, and 60,000 pamphlets. By gift and legacy, the university received about \$1,000,000 from Mrs. Russell Sage. John D. Aichbold's gifts, including the stadium and gymnasium, aggregated over \$2,000,000. The School of Nursing was established in 1915, and the college of home economics was opened as a school in 1918, and made a college in 1921. The college of business administration was established in 1920, having been founded as a school in 1919. An evening school was opened in 1918. In 1927 the University inaugurated a policy of surveying, with the aid of outside experts, the curricula and academic equipment of its various schools and departments. As a result of the study, the law school was completely reorganized with full-time teachers replacing practicing lawyers who had been teaching on a part-time basis. With the cooperation of the American Library Association, a similar study was made of the library school resulting in reorganization. By 1928 a similar result was achieved with the college of home economics and in the same year a teachers'-pension system for all grades was adopted. Work in dramatics under expert supervision largely took the place of extra-curricular activity in this field and a system of student self-government was established. Productive funds in 1928 amounted to \$3,539,985. Chancellor, Charles W. Flint, D.D., LL.D., Paed D.

SYRIA, *shir'ya*. A former province of the Turkish Empire in Asia, but after 1920, an independent state, whose affairs were supervised by France as a mandatory power. The French mandate for Syria was confirmed by the League of Nations on July 24, 1922. Henri Ponsot was appointed high commissioner in October, 1926. Administratively, the country was divided on Jan. 1, 1925, into four territories, namely Syria, Alawiyya, Great Lebanon, and Jebel Druze. The total area of the mandated region has been placed at 60,000 square miles, and the population in 1926, at 2,046,857. The population is for the

most part of Arabic origin, and Arabic is the prevailing language. Other nationalities represented are Turks, Turcomans, Kurds, Circassians, Armenians, Persians, Jews. A religious classification showed the following: Moslems 1,514,755, of whom 1,075,816 were Sunni Moslems, Christians, 505,419; and Jews (principally in the four large cities) 16,526. The important cities with their 1921 populations were Damascus (170,000); Aleppo (140,000), Beirut, capital of Greater Lebanon (80,000), Hama (35,000), Homs (60,000), Tripolis (30,000), Antioch (30,000), Alexandretta (15,000). Education is supported by the French, British, and American missions. The last maintain a college at Beirut, as do also the Jesuits and Greek Catholics. The education of women is receiving considerable attention.

Industry. Syria is an agricultural country, though it was estimated that only 10 per cent of the lands west of the Euphrates was being tilled. Of the million acres being worked, fully 750,000 were under wheat and barley. In 1927 the yield (in metric tons) was: wheat, 396,600; barley, 333,650. The wheat raised was entirely for local consumption, while barley, after 1919, was being exported in considerable quantities to England and Germany, to be used in the making of beer. Other crops of importance are sesame (from which oil is produced), tobacco, olives, silk, oranges, lemons. Live stock suffered severely during the World War, as may be seen by the fact that sheep and goats numbered 4,800,000 in 1914, and only 2,408,000 in 1920, cattle 500,000 in 1914, and only 293,000 in 1920, horses and donkeys 270,000 in 1914, and only 143,000 in 1920. Lead, iron, copper, nickel, lignite, petroleum, and other minerals have been discovered, but none mined in paying quantities. Manufacturing is still in an embryonic stage. Sericulture, oil, soap, flour receive some attention.

Trade. Previous to the War, exports averaged 60,000,000 francs (\$11,670,000), and imports 124,000,000 francs (\$23,932,000). That the country's trade was showing some recovery after 1920 was revealed by the trade figures for the subsequent years. Imports for 1927 amounted to \$50,300,000; exports, \$21,486,000. The very high adverse trade balance, and the falling off of the transit trade with the interior because of customs barriers, indicate that the economic situation is a difficult one. The country's revenue (i.e., invisible exchange) was being derived mainly from the spendings of the French Army of Occupation, and from remittances by Syrians in North America and South America. Leading exports are wool, hides, olive oil, tobacco, fruits, wine, etc. Leading imports are cotton goods, food products, iron and steel, building materials, etc. Principal countries of origin in value of imports in 1927 were United Kingdom, France, Egypt, Italy, Germany, United States, Belgium, Turkey. Principal countries of destination in value of exports in 1927 were France, Palestine, Egypt, Turkey, United States, Italy. The port of Beirut handled three-fourths of all the trade. Other customs ports were Tripoli, Alexandretta, Aleppo, and Damascus.

Communications. There were, in 1927, 492 miles of railway in Syria. A line traversed the interior from north to south with branches to the chief ports. Alexandretta, by way of Aleppo, was connected with the Bagdad Railway, which had 190 miles of line in Syria. Damascus, similarly, was on the route of the Hedjaz railway

into the south. A motor route extends across the Syrian desert between Beirut and Bagdad. In 1927, 1612 vessels of 3,099,278 tons entered the ports of Lebanon and Syria.

Finance. In May, 1920, the unit of currency was made the Syrian pound (£S), equivalent to 20 French francs (\$3.96). Notes were issued by the Bank of Syria, and by Dec. 31, 1927, notes in circulation totaled £S7,675,000. The budget for 1927 showed a balance of receipts and expenditures of 1,508,630 Syrian gold pounds; that for 1928 a balance at 2,343,608 pounds. In 1921 the whole mandate territory had received a subsidy of 25,000,000 francs from the French government, but in 1922 this grant was discontinued in the hope that the local budgets could be made to balance.

History. Though French and British troops did not move on Syria until late in 1918, the location of the country as one of the important transit lands between the East and the West made it the scene of extraordinary hardships for the population. As a result of conscriptions, deportations, disease, starvation, and the exactions of their Turkish rulers, as well as the stringency of the blockade, the native Syrians had been depressed into a condition of complete helplessness. By 1918 it was estimated that the population of the vilayet of Beirut alone had fallen off 150,000. The débâcle of the Turk during October–November, 1918, and the arrival of French and British troops, however, did not put the fears of the population at rest. Those agreements among the Allies for the partition of the Near East which had been made public had taught the Syrians that an interest in them was not occasioned by strictly altruistic motives. By the secret Treaty of London of 1915 and the Sykes-Picot Agreement of 1916, Turkey in Asia had been partitioned into spheres of influence among the Allies, the Syrian coast and hinterland falling to France. The British and French Armies of Occupation were received, therefore, with open hostility. The withdrawal of British troops in November, 1919, left the French in a precarious position.

By the treaty of Sèvres (Aug. 10, 1920), Turkey renounced Ottoman sovereignty over Syria, including Cilicia, and by subsequent action of the Council of the League of Nations, July 22, 1922, France was formally instructed with a mandate over Syria, although formal promulgation of the mandate was further postponed by Italian objections. The southern and eastern boundaries were fixed in principle by an Anglo-French Convention on Dec. 23, 1920, and definitively by an Anglo-French Agreement of Feb. 3, 1922, effective Mar. 10, 1923. The northern frontier, which by the Sèvres treaty had run eastward from the gulf of Alexandretta to the Tigris, including the corresponding section of the Bagdad Railway, was modified by the Franco-Turkish Treaty of Angora, Oct. 20, 1921; by this treaty, France restored to Turkey not only Cilicia but also a long strip running eastward almost to the Tigris and including the Bagdad Railway from a point near Aleppo to Nisibin—about 9000 square miles in all. This new boundary was confirmed by the Treaty of Lausanne, July, 1923. Meanwhile, the proposals of the Syrian National Congress of July 2, 1919, for a free Syrian state to extend into Palestine and a request for an annulment of those agreements whose purpose was the partition of Syria having met with rejection, the anti-European hatred was fanned into flame.

Affairs were further complicated by the pretensions of Emir Feisal, son of King Hussein of the Hedjaz, who sought to found a constitutional monarchy in Syria and at the same time maintain the friendship of the British and French. Fighting broke out late in 1919 and continued through 1920. On Mar. 8, 1920, a Syrian National Congress meeting once more at Damascus repeated the programme for complete independence and offered the crown to Emir Feisal. Feisal accepted and formed a government. The result was a rekindled ardor, and the attacks on the French increased in number, against the counsels of the new King, whose desire it was to conciliate the French. Antioch fell before an Arab force in March, while disorders spread far to the south into Palestine. Assistance was received from the Angora government in the north and fighting went on between the Turks and the French in northern Syria during the whole of 1920.

In July, 1920, a French Army under General Gouraud won an overwhelming victory over the Arabs outside Damascus, occupied that city, and overthrew King Feisal. On August 4, the Emir was compelled to leave the country. Not until July, 1921, however, could Gouraud report that the pacification of Syria was completed. Then, to prevent the development of any strong nationalist feeling, Syria was divided into five administrative districts, each with a different name and different laws, but all under the same French High Commissioner who thus became a sort of governor general. Lebanon, in the south, was given autonomy and enlarged by attaching the plains of Bekaa to the mountains of Lebanon. Jebel Druze (south of Hauran) likewise became an autonomous unit, with an elected council and a Druse governor. The remainder of the mandated territory was divided into the three states of Aleppo, Damascus, and the Territory of the Alaouites, each state having a more or less representative and autonomous State Council, and sending five delegates to the Federal Council of Syria.

On Jan. 1, 1925, Damascus and Aleppo were united to form the single state known as the Republic of Syria. Naturally, it was the French officials in every case who were the Government. In 1929 the French officials in the entire Syrian mandate numbered 352.

A group of factors combined to make relations between the French and the natives difficult: (1) The Moslems, who were in the majority, felt that the French were favoring the Christians; (2) a strict censorship of press and speech was maintained; (3) the depreciated French currency was substituted for the gold and silver that had been in circulation previously; (4) French was made the language of the law courts; (5) martial law was set up and continued until 1925. In January, 1925, High Commissioner Weygand, who had been appointed in May, 1924, was removed at the insistence of the radicals in the French Chamber of Deputies. He was succeeded by the anti-clerical General Sarrail, who antagonized even the Christian elements in Syria, and then, in July, 1925, crowned his administration by imprisoning a number of rebellious Druse sheiks after having invited them to Damascus for a peaceful conference.

The revolt, which until then had been local, now spread quickly and some French troops in Damascus were attacked by an outraged populace. A bombardment and bombing of the city

by artillery and airplanes followed, in which about one thousand natives, mostly women and children, were killed, and the city ruined. Sar-rail was recalled, and during an interim the French authorities armed the Christians so that they might help subdue the revolting Moslems. A new commissioner, M. de Jouvenel, appointed Nov. 6, 1925, restored order temporarily, but was faced by a new uprising early in 1926. On May 6, Damascus was again bombarded, whereupon the League of Nations Mandates Commission criticized French policy. A new commissioner, M. Auguste Henri Ponsot, was then appointed (Oct. 4, 1926). He had 30,000 French troops at his disposal and by the summer of 1927 could announce the restoration of quiet and order.

The exodus of a total of about 50,000 Syrians from their country in the years 1926 to 1928 led to a debate in the French Chamber in November, 1928, on the advisability of granting Syria its unconditional independence. Poincaré, however, strenuously opposed the idea. His chief point was that if France got out of Syria the League would assign it to some other power, and no other country could undertake the task of preparing Syria for independence with such "magnificent disinterestedness" as France. The Chamber then simply dropped the matter.

On Aug. 12, 1928, Ponsot prorogued a Syrian Constituent Assembly for three months because of its insistence upon inserting a declaration calling the mandate an "independent sovereign state" into the draft of a new constitution. In November, the Assembly was prorogued for another three months, and then in February, 1929, it was dismissed for a third time, on this occasion indefinitely. Then, the students of the Syrian University in Damascus went on strike on Apr. 4, 1929, because the Government proposed to reduce the appropriation for the institution. The law and medical students were soon joined by the students of all the secondary schools in Damascus, and on April 9, they sent a delegation to Beirut to confer with High Commissioner Ponsot. On April 13, he acceded to their request

and the budget was restored. Reports from Syria in June, 1929, indicated that "economic conditions in the country continued to deteriorate." Elizabeth P. MacCallum's *The Nationalist Crusade in Syria*, published by the Foreign Policy Association, New York, 1928, presents the best account of Syrian relations in the decade following the War.

SZE, SAO KE ALFRED (1877-). A Chinese diplomat, Minister to the United States (1921-29). He was born in the Province of Chekiang and educated at Cornell, and, in the law, at St. John's (Shanghai), Toronto, Columbia, and Syracuse. After activity in Chinese railways, he became Minister of Post and Communications, and acting minister of finance, in the cabinet of the first Republic of China (1912), officer of ceremonies at the President's office (1913), and minister from China to Great Britain (1914-21), when he became envoy to the United States. He was also a delegate to the Paris Peace Conference, was chief delegate to the Washington Conference on the Limitation of Armaments and Pacific Far Eastern Questions (1921), acting Minister of Foreign Affairs (1922), and Chinese delegate to the International Opium Conference at Geneva (1924-25). He published *Addresses* and *The Geneva International Opium Conference*.

SZYMANOWSKI, KAROL (1883-). A Polish music composer, born at Timoshevka, Southern Russia. He studied with S. Noskowski in Warsaw, where he made his home and later became professor at the conservatory. Beginning as an imitator of Chopin, with an admixture of impressionism, he rapidly drifted to Futurism. He wrote two operas, *Hagut* (Warsaw, 1922) and *Le Roi Roger* (Warsaw, 1926); three symphonies; a symphonic poem, *Penthesilea*; a concert overture; a piano concerto and a violin concerto; *Demeter*, for contralto, female chorus and orchestra; *Agave* for soprano, chorus, and orchestra; a number of pieces for violin and piano, and piano works, some in the larger forms (three sonatas, three poems, a fantasy).

T

TACNA-ARICA DISPUTE. An international controversy between Chile and Peru that was argued intermittently following the conclusion of the Chilean-Peruvian War and the Treaty of Ancon of

1883 By the treaty, Chile was awarded the province of Tarapaca outright. The provinces of Tacna-Arica, on the other hand, were to remain in Chile's possession for 10 years, upon the conclusion of which a plebiscite was to be held in the territory to decide its ultimate disposition. A payment of 10,000,000 Peruvian *soles* (Chilean dollars) was to be made to the defeated contestant nation. Chile's contention was that the plebiscite provision was inserted in the treaty to allay Peruvian national feeling, it being the intention of the peace commissioners that Chilean sovereignty should remain uncontested, and for that reason no terms were formulated for the holding of the plebiscite.

The year 1893 found Peru demanding the execution of the treaty but proposing such arbitrary conditions, e.g., that only Peruvian citizens be permitted to vote in the plebiscite, that no understanding could be reached. The point became a *cause célèbre* in both countries, political campaigns being waged on it as the single issue. Relations were broken off in 1901, resumed in 1905, severed again, resumed in 1910, and cut off indefinitely in 1911. Chile, meanwhile, had spent great sums in the development of the provinces, commencing irrigation, sanitation, and port-development projects, and spending \$25,000,000 on the railroad from Arica to La Paz, Bolivia, alone.

In 1919, aroused by the anti-Peruvian riots in Chilean cities, and the publication of the Chilean-Bolivian Treaty of 1905, by which Bolivia had been promised an outlet to the sea by way of the city of Arica, Peru once more pressed her claims. In 1920 she asked that the question be put on the agenda of the Assembly of the League of Nations, only to withdraw the request soon after. In 1921 Chile once more sought the holding of a plebiscite, but meeting no response except the demand that the whole treaty be reconsidered, broke off negotiations. Meanwhile Bolivia, on the grounds that the question had become a universal one and involved the freedom of the Pacific, interjected herself into the affair. It was not until 1922 that the first hope of a settlement appeared. On Jan. 17, 1922, the United States dispatched identical notes to Chile and Peru for the purpose of effecting an agreement. On July 15, a protocol was signed by representatives of both nations nominating the President of the United States as arbiter; Chile and Peru accepted the protocol as the basis for discussion, and in February, 1923, delegates arrived at Washington, and the long process of investigation, filing of briefs and counterbriefs, was begun; Peru's final brief was not filed until Apr. 12, 1924.

Meanwhile, President Coolidge succeeded President Harding, and in 1925 he decided that a

plebiscite should be held under the auspices of a Plebiscitary Commission of three members, one appointed by the United States, and one each by Chile and Peru. Both countries accepted this decision (Peru under protest, however) and on Aug. 4, 1925, the Commission, under the presidency of General J. J. Pershing (U. S.), commenced its work of preparing the ground for a plebiscite. On Feb. 27, 1926, Pershing resigned because of ill health, and was succeeded by Major General Lassiter. In March, the plebiscite was indefinitely suspended due to continued disorders and riots in the provinces, and on June 14, the Commission by a two to one count voted to abandon the plebiscite altogether. The reasons were the absence of suitable plebiscitary conditions, and the obstructionist tactics adopted by Chile in the area. Naturally, the Chilean representative opposed both the decision and the final report that was rendered by the other two members of the commission. On June 18, 1926, the Chilean Ambassador at Washington notified Secretary of State Kellogg that the unexpected outcome of the efforts for a plebiscite automatically ended the arrangement whereby the good offices of the United States had been invoked. A two-year period of deadlock ensued during which no negotiations were carried on.

However, at the Pan-American Conference held at Havana in February, 1928, the delegates of Chile and Peru met and agreed to urge the resumption of diplomatic relations between their governments. On July 9, Secretary Kellogg sent identical notes to both governments urging the same thing. On July 13, diplomatic relations actually were resumed, and in October the respective embassies were reestablished after a lapse of 17 years. Then, on October 10, the State Department at Washington announced that the Boundary Commission which had been holding sessions in New York for three years, would suspend its activities for four months with the consent of the governments involved, to leave the field free for diplomatic negotiations. These negotiations ended in the reaching of a tentative agreement in 1929, which was presented to President Hoover on May 3. Hoover summarized the points agreed upon, and transmitted the text of a final basis of solution to the contending governments on May 14. On May 17, Hoover announced that both Chile and Peru had accepted the proposals, which were then incorporated into a final treaty on June 3, and ratified by both parties, amidst great rejoicing, within a little over a month. The final arrangement assigned Tacna to Peru and Arica to Chile, with the dividing line beginning at a point designated "Concordia." There were some further minor adjustments, and Chile agreed to pay Peru the sum of \$6,000,000. See BOLIVIA; CHILE; PERU.

TACOMA. A city and port of the State of Washington. The population increased from 83,743 in 1910 to 96,965 in 1920 and to 110,500 in 1928, by estimate of the U. S. Bureau of Census.

The population of the metropolitan area in 1928 was 125,000. A zoning ordinance was adopted in 1919, and an active city planning programme was undertaken the following year. Under a comprehensive port-development project, organized in 1918, municipally-owned piers covering an area of 280 acres were built. In 1928 the harbor had 35 docks and wharves with an area of 950,000 square feet. The port was served by more than 60 steamship companies. Fort Lewis, a permanent divisional establishment of the U. S. Army, was developed during the World War, and a psychiatric hospital for war veterans was erected at American Lake in the environs of the city. In 1924 an active building programme was undertaken including new public schools, new buildings for the College of Puget Sound and Annie Wright Seminary, and office, church, hotel, and fraternal structures. By 1928 Tacoma had 38 elementary schools, 6 intermediate schools, and 2 high schools. In 1926 a bond issue of \$4,000,000 was approved for the construction of the Cushman power plant on the Skokomish River flowing out of Lake Cushman. A dam, 275 feet high, was built across the canyon through which the Skokomish River flowed, and the plant erected on its bank was capable of developing 50,000 horse power which, with the power developed by the Nisqually River plant, gave the city a total of 88,000 horse power. Between 1926 and 1928, Tacoma installed a new water-supply system, consisting of a 25,000,000-gallon reservoir 5 miles from the city, a 1,000,000-gallon stand-pipe in the city, and an electrically operated pumping plant furnishing a daily supply of 10,000,000 gallons. Tacoma has the reputation of leading in the production of fir doors, fir veneers, panels, and wooden columns, and has an important refinery for copper. In 1927, 12,335 persons were employed in 322 industrial establishments and received \$16,982,714 in wages; the value of products manufactured was \$79,881,871. The assessed valuation of property in 1927 was \$65,777,000; the net debt was \$11,028,000.

TACTICS, MILITARY. See **STRATEGY AND TACTICS**.

TAFT, HENRY WATERS (1859-). An American lawyer (see VOL. XXI). In 1917-19 he was chairman of the permanent legal advisory board for Greater New York under the selective service regulations. He was a delegate to the Republican National Convention in 1920, and chairman of the coalition campaign committee in the mayoralty election of New York City in 1921. He was president of the New York State Bar Association (1919-20), president of the Association of the Bar of the City of New York, 1923-25, and became chairman of the American Bar Association's committee on jurisprudence and law reform in 1925. He published *Occasional Papers and Addresses* (1920), *Japan and the Far East Conference* (1921), *Law Reform* (1926), *An Essay on Conversation* (1927).

TAFT, WILLIAM HOWARD (1857-). The twenty-seventh President of the United States (see VOL. XXI). He was cochairman of the National War Labor Conference Board in 1918-19, and was president of the League to Enforce Peace, engaged in the promotion and ratification of the Treaty of Peace and the League of Nations. On June 30, 1921, he was appointed Chief Justice of the United States. He became chancellor of the Smithsonian Institution in 1923. To his list of honors were added the honorary LL.D. degree from Cambridge and Aberdeen

(1922), and the University of Cincinnati (1925), and the honorary D.C.L. degree from Oxford (1922). In 1922 he was also made an honorary bencher of the Middle Temple (British). His later writings include *Our Chief Magistrate and His Powers* (1916); *Taft Papers on the League of Nations* (1920).

TAGORE, tā-gōr', SIR RABINDRANATH (also written THĀKURA, RAVĪNDRANĀTH (1861-). A Hindu poet (see VOL. XXI), also a musical composer. Of his writings in English, the later works include *Kabir's Poems* (1915); *Stray Birds and Hungry Stones* (1916); *Reminiscences, Personality, and Nationalism* (1917); *Parrot's Training and Mashu and Other Stories* (1918); *The Home and the World* (1919); *Glimpses of Bengal and Thought Relics* (1921); *Creature Unity* (1922); *Greater India* (1923); *Gora*, a novel, and *Letters from Abroad* (1924); *Broken Ties*, stories (1925); and *Fireflies*, English translations from Hindu poets (1928). Consult *Rabindranath Tagore, His Life and Work* by Edward John Thompson (1921); *Rabindranath Tagore, a Bibliography*, by Ethel May Kitch (1922); *Rabindranath Tagore: Poet, Patriot, Philosopher*, by K. S. Ramaswami Sastri (1924); and *Rabindranath Tagore, Poet and Dramatist*, by Edward John Thompson (1926).

TAHITI. See **PACIFIC OCEAN ISLANDS, Society Islands**.

TAILLEFERE, GERMAINE (1892-). A French composer, born at Pau-St. Maur, near Paris. While a student at the Paris Conservatoire, her brilliant talent attracted attention, and she was graduated with special distinction. She began her career as a composer as a member of the notorious group known as "Les Six," but soon rebelled against their extravagances and seceded, following her natural inclinations as a rather advanced impressionist. In 1925 she was heard in the United States as a pianist in her own works. She has written a string-quartet; *Ballade* for piano and orchestra; a piano concerto in D; a violin sonata; a ballet, *Le marchand d'oiseaux* (Paris, 1923).

TAKAHASHI, ta'ka-hu'shā, KOREKIYO (1845-). A Japanese financier and parliamentarian (see VOL. XXI). He was again Minister of Finance in 1918 and during 1921-22 served as Prime Minister. In 1924 he resigned the peerage in favor of his son and from his seat in the Upper House to contest the seat for Morioka in the Lower House. The following year he resigned as leader of the Seiyukai.

TALC AND SOAPSTONE. Talc and soapstone share with sulphur, petroleum, and copper the distinction of being one of the minerals of which the United States produces more than all the rest of the world. In 1900 the United States produced approximately 90,000 short tons of talc, valued at about \$900,000. By 1928 the United States output of talc had increased to 209,976 short tons, valued at \$2,537,994, ground talc representing of this amount 195,680 tons, valued at \$2,419,569. New York is the largest producer of talc in the United States with 107,321 tons, though California and Vermont also produce considerable amounts. Despite the fact that the United States produces more than all other countries in the world, it is also a large importer of talc, there being received in 1928, 27,049 tons, valued at \$579,915. Most of the imported talc comes from Canada, Italy, and France.

Workable soapstone deposits are few and are

very difficult to work. In the United States, many deposits are reported in Virginia and in Maine. Deposits also have been reported in various sections of Canada, but, upon examination of a great many of these, the nature of the deposit does not lend itself to quarrying large pieces, and therefore does not present a profitable outlook. As the soapstone business is limited to a very few producers, the U. S. Bureau of Mines does not publish any figures of production. The talc is used for gas-burner tips, while the soapstone is an insulator of heat and electricity. Soapstone bricks are used for the lining of digesters and furnaces in which the sulphate pulp is treated in making Kraft paper. Talc also is used for talc powder, textiles, paper, soap, and rubber.

TALLEY, MARION (NEVADA) (1906-). An American coloratura soprano, born in Nevada, Mo. She studied with local teachers in Kansas City, then with Frank Laforge in New York, and spent a year in Europe, perfecting herself in French and Italian. Without any previous stage experience, she was engaged at the Metropolitan Opera House, where she made her debut as Gilda in *Rigoletto* (Feb 17, 1926). Long before her appearance, clever advertising on the part of her press agent had prepared the public to expect something quite out of the ordinary, so that, for the first time in the annals of opera, it happened that for the debut of an entirely unknown singer people were clamoring for tickets and blocking traffic, making it necessary for the police to restore order hours before the performance began. Even more surprising, and impossible of explanation, is the sensational success of a singer endowed with no unusual voice, either in quality or range, with little histrionic ability. Three years later, Miss Talley created a second sensation, when she retired from the stage as suddenly as she had appeared. She made her farewell appearance in the title rôle of Thomas's *Mignon* (May 6, 1929) in Cleveland, when the Metropolitan Company was making its annual spring tour. Shortly afterward, she took up her residence on a farm she had purchased in Missouri.

TALMADGE, CONSTANCE (1900-). An American actress, born in Brooklyn, N. Y. She began acting in moving pictures in 1916, and soon became very popular. Besides other plays, she appeared in *Intolerance*; *Mrs. Leffingwell's Boots*; *Romance and Arabella*; *In Search of a Sinner*; *Two Weeks*; *A Temperamental Wife*; *The Perfect Woman*; *Mama's Affair*; *Polly of the Follies*; *East is West*; and *The Dangerous Maid*.

TALMADGE, NORMA (MRS. JOSEPH M. SCHENCK) (1897-). An American actress and motion-picture producer, born at Niagara Falls, N. Y. She is a sister of Constance Talmadge. She began to act in moving pictures at 14 years of age and soon achieved notable successes, among them being: *The Crown Prince's Double*; *The Social Secretary*; *The Secret of the Storm Country*; *The Ghosts of Yesterday*; *Her Only Way*; *The Forbidden City*; *The Passion Flower*; *The Sign on the Door*; *The Wonderful Thing*; *Smilin' Through*; *Secrets*; *Song of Love*; *Kiki*; *Graustark*; *Camille*.

TANAKA, BARON GIICHI (1863-1929). A Japanese soldier and premier, born in Yamaguchi of the Seiyukai clan, of which he became leader in 1925. He entered the army as a sub-lieutenant in 1886, was graduated from the Staff

College in 1898 and in 1910-13 was director of the Military Affairs Bureau. He became commander of the Second Infantry Brigade at the outbreak of the World War and in October, 1915, was made lieutenant general and vice chief of the General Staff. Later, he was Minister of War in the Hara, Takahashi, and Yamamoto cabinets, and from April, 1927, to July 2, 1929, he was Premier and Minister for Foreign Affairs in a conservative cabinet composed exclusively of members of the Seiyukai. His cabinet's aggressive policy toward China was given as the chief reason for its overthrow by the Japanese liberals. Tanaka was created a baron in 1920. He was posthumously promoted to baron, senior grade, and decorated with the Grand Cordon of the Rising Sun by Emperor Hirohito. See JAPAN, under *History*.

TANA TUNNEL. See TUNNELS.

TANGANYIKA, tan'gun-yě'ka, TERRITORY. Formerly German East Africa, but since 1919 a British mandate territory, situated in southeastern Africa, with an area of 373,500 square miles, and a native population (April, 1921) of 4,107,000. There were also 14,991 Asiatics and 2447 Europeans on that date. The estimated population in 1927 was European, 5300; native, 4,885,000; Asiatic, 24,000. Dar-es-Salaam, the capital and chief commercial centre, had about 25,000 inhabitants in 1927; Tanga, 16,400; Tabora, 25,000. Under British rule, because of the inevitable readjustments, industry and trade took some time in regaining their normal status. Imports for 1913 were valued at £2,667,925; in 1921, £1,426,125; in 1927, £3,672,064. Exports for 1913 were £1,777,552; for 1921, £1,089,990, for 1927, £3,340,576. The chief exports are sisal hemp, coffee, groundnuts, cotton, grain, copra, hides. The chief imports are cotton piece-goods, foodstuffs, building materials, coal, machinery, tobacco, spirits. Imports from the United States in 1928 were valued at £308,000, as compared with £263,000 in 1927. Exports to the United States totaled £184,000 in 1928 and £61,000 in 1927.

The victories of the British and Belgian troops in East Africa during the World War left the Territory completely under Allied control. In May, 1919, the Supreme Council turned the area over to Great Britain as a mandate territory, but by agreement with Belgium in September, 1919, the western provinces of Urundi and Ruanda were ceded under mandate to the Belgian Congo in order to give the latter a frontage on Lake Tanganyika. Great Britain retained such areas as were needed to allow for the projected Cape to Cairo Railway, as well as the disputed Ujiji Province which contained the western terminus, Kigoma, of the important Central Railway. In 1921, however, Belgium was given the right to use the railway free of duties. Under the Order in Council of July 22, 1920, the British administrative machinery was set up with a governor and a nominated executive council. By the Covenant of the League of Nations, perfect racial equality in matters of residence and trade was assured, with the result that the Indians, unlike those in the Kenya Colony to the north, were permitted unhampered social and economic liberty. As a result, they rapidly penetrated into all regions of the Territory in the rôle of small traders. By 1921, the British administration was functioning normally; German estates had been sold; the Indian penal and civil codes were introduced; the basis of the currency was made

the shilling (Jan. 1, 1922); English names and weights were substituted; and the Kenya Colony system of revenues was installed, i.e., customs duties, trade taxes, native hut and poll taxes. Legislation for the abolition of slavery was enacted in 1922. Revenues for 1917-18 were £336,446 and expenditures £157,285; for 1921-22, £978,192 and £1,807,890; for 1927-28, £1,904,107 and £1,707,196. Budget estimates for 1928-29 were: revenue, £1,842,490; expenditures, £1,832,828. Completion of a 50-mile stretch of railway from Moshi to Arusha in 1929 brought the total railway mileage of the Territory up to 1276 miles.

TANGIER CONTROVERSY. The status of Tangier port, which, because of its strategic position at the entrance to the Mediterranean, was an intimate concern of the foreign offices of France, Spain, and Great Britain, became a serious cause for ill feeling in the years following the World War. Spain's attempts during 1919-21 to effect a Franco-Spanish understanding on the basis of an enlarged Spanish interest in Tangier (and thus negate the policy of internationalization temporarily agreed upon in the Franco-Spanish Treaty of Nov. 27, 1912) were rebuffed, for they conflicted with the French ambition which looked to the expansion of French interest not only over Tangier but the whole of Morocco as well. In 1922 Great Britain, finding that the subject was assuming major importance, interjected herself into the controversy and insisted that the entire question be reopened. In July, 1923, a commission composed of French, Spanish, and British experts met for the purpose of preparing a new agreement. Early it became evident that the question had taken on an international character, when both the United States and Italy indicated their interest, the United States on the general ground that it had figured in the Algeiras Conference and would therefore be concerned in any new understanding, Italy because of her position as a Mediterranean Power. The sittings of the commissions were therefore frequently interrupted, as the experts found it necessary to repair to their home governments for further instructions. In October, Italy, with the approval of Spain, demanded that her delegates be given seats at the conference.

In October, 1923, the American Department of State made public a note addressed to the British, French, and Spanish governments in which the request for the maintenance of the open door in the settlement of the status of Tangier was reiterated. It was not until Dec. 18, 1923, that the sittings were completed. The provisional agreement as submitted to the governments of Great Britain, Spain, and France, and ratified, effective June 1, 1925, contained the following provisions. The Tangier Zone, an area of 225 square miles around the city of Tangier, whose permanent neutrality was assured, was to continue as a part of Morocco under its own constitution. The Municipality of Tangier was to be under both a Committee of Control, made up of the eight consular officers of the Powers that had signed the Algeiras agreement, and an International Legislative Assembly of twenty-seven members, consisting of representatives of the Powers (Italy here included) and the native Mussulmans and Jews. The customs service, though administered by the Moroccan government, was to be under the control of the international administration. Economic equality at the port was to be observed; the capitulations were to be supplanted by a mixed tribunal of French, Spanish, and British magistrates; no

fortifications were to be erected; the signatories of the Algeiras agreement (the United States included) were to be invited to adhere to the new convention as soon as it received the ratification of the three contracting parties.

A number of Powers signatory to the Act of Algeiras, including Italy, declined to adhere to the 1923 Tangier Statute and it was modified by a protocol signed at Paris July 25, 1928, to which Italy was a party. It was conceded generally that Great Britain had won a diplomatic triumph in the new pact over the Mediterranean countries, France, Spain, and Italy, and by the internationalization of the port had made sure of the safety of the route to India. See MOROCCO, under *History*.

TANKS, ARMORED. See STRATEGY AND TACTICS.

TANNENBERG, BATTLE OF. See WORLD WAR, *Eastern Front*.

TARDIEU, tãr'dyë, ANDRÉ (1876-). A French public official and author, born in Paris, and educated at the Lycée Condorcet and École Normale Supérieure. A former editor of *Le Temps*, he was a member of the Chamber of Deputies (1914-24, since 1926). High Commissioner of France to the United States (1917-19), Minister of the Liberated Regions (1919-20), Minister Plenipotentiary at the Peace Conference and President of the League of Nations Control Commission during the same period. In the Chamber of Deputies in 1923, he led the Nationalist Party group which found Poincaré too lenient toward the Germans. Three years later, he became Minister of Public Works in Poincaré's cabinet (1926-). His writings include *Questions diplomatiques de l'année* (1904), crowned by the French Academy in the following year; *La Conférence d'Algeiras*; *Notes sur les États-Unis* (1908); *France and the Alliances* (1909); *Le Prince de Bulow* (1909); *Le Mystère d'Agadir* (1912); *L'Amérique en Armes* (1918); *The Truth about the Treaty* (1921); *France and America* (1927).

TARDIVEAU, RENÉ. See BOYLESVE, RENÉ MARIE AUGUSTE.

TARIFF IN THE UNITED STATES.

Recent Developments in Tariff Legislation in the United States The Underwood Tariff of 1913 lowered the rates which had existed under the Payne-Aldrich Bill. The average rate on dutiable goods in 1910 was 42 per cent; in 1915, 33 per cent. The Underwood Tariff Bill also increased the free list. As a result, 63 per cent ad valorem of the goods admitted to the United States in 1915 paid no duty. This was 14 per cent more than in 1910. The construction of a tariff bill is becoming very difficult and complicated. The Underwood Bill covered more than 100 pages and actually enumerated more than 3000 different articles; the list of nondutiable goods also was given. The goods on which duty was to be paid were cited in 14 schedules, the rates ranging from 5 per cent on bar iron to 60 per cent on jewelry, playing cards, and expensive silk goods. The general result of such a voluminous bill was to confuse the average citizen, and Congress itself felt that the guidance and assistance of experts was greatly needed. A Tariff Board had been provided for in the Payne-Aldrich Bill of 1909, but when the Democrats came into power, it was abandoned. So much difficulty was experienced by Congress in the construction of the Underwood Tariff Bill that the Democrats themselves provided in 1916 for a new Tariff Commission, the function of which was to advise

the President and Congress on general problems relating to the tariff. It was apparent, however, that the device of a tariff commission had not proved a success. It could not be scientific and it was difficult to keep it clear of political influence. In the presidential campaign of 1928, the Tariff Commission found no friends, for the Democratic Party severely criticized it while the Republican Party passed over its existence in silence.

The Fordney-McCumber Bill of 1922. When the Republicans were swept into power by the election of 1920, it was on the distinct understanding that the tariff rates would be revised upward. Congress had great difficulty in drafting a bill which was under consideration for 20 months. The Senate finally adopted the bill after 2436 amendments had been made to the original. It was not until 1922 that the legislation known as the Fordney-McCumber Bill was passed. The rates of duty are the highest in United States history. Duties were levied on agricultural products, sugar, wool, woolen goods, cotton goods, silk, metals and metal manufactures, tobacco, spirits and beverages, chemicals, jewelry, earthenware and glassware, wood, paper, and many other classes of commodities. High rates were levied on wool, on certain grades of which the duty reached 155 per cent. Rates on cutlery in some instances were as high as 40 per cent ad valorem. The rates on embroidery and cotton lace were 90 per cent. Many of the articles which had been put on the free list by the Democrats in 1913 were made dutiable under the Fordney Bill. The few articles left on the free list included coffee, cocoa, agricultural implements, newsprint, hides, raw cotton, tea, gunpowder, tin, and potash.

Most students of economics and many business men believed that the Fordney-McCumber Bill was a mistake. The United States is a creditor nation. The only way in which foreign debtors can pay it is by sending goods. The price which consumers must pay for protected goods is probably not compensated for by any stimulation which industry may have received from the provisions of this bill. The United States cannot continue to export goods unless imports from other countries are received.

One of the most interesting features of the Tariff Act of 1922 was the flexible tariff provisions. When the President of the United States, "after careful investigation, finds that the rates of duty in the Tariff of 1922 do not in fact equalize the costs of production of any article or articles between the United States and the principal competing foreign country, he shall determine the rates that will so equalize such difference; and 30 days after the proclamation is made, the rates of duty proposed by him shall be in effect on the articles named in the proclamation in lieu of the rates of duty specified in the Tariff of 1922. These rates of duty are to be based upon foreign valuation. He cannot increase or decrease any rate of duty more than 50 per cent of the amount thereof as provided in the Tariff of 1922."

By the act, the Tariff Commission was to make the necessary investigations and recommend the rate to be fixed by the President. It was hoped this device would make the Tariff "scientific," but it soon became evident that what flexibility there was, was flexibility upward. Before the period under review was over, it was seen that the flexibility provision was virtually inoperative

and that the rates continued as written into the Act of 1922.

The campaign of 1928 showed that the protection principle was firmly entrenched in the American political system, for even the Democratic Party departed from its historic position when it pointed out that it had no intention of tinkering with the tariff. The extra session of Congress, called for on Apr. 15, 1929, by President Hoover, was to be concerned largely with tariff revision. This was due to the promise rendered to the farmers during the campaign that greater protection would be afforded them; but during February and March (as a result of the hearings held by the House Ways and Means Committee), it was evident that the high-tariff interests were mobilizing their forces for a fight for revision upward all along the line, and this despite the President's request that revision should be "limited." The high protectionists (aided by the farmers and the American Federation of Labor) were insisting upon an American valuation in the assessment of tariffs, as against the foreign valuation provided for in the Act of 1922. To show the extraordinary interest in tariff revision in 1929, it may be pointed out that the House Ways and Means Committee sat for 45 days prior to the meeting of the special session and heard 1200 witnesses.

During the summer and autumn of 1929, the Senate deliberated the House tariff bill. The House schedules were a triumph for the high protectionists and increases were generally upward all along the line. The publication of these schedules brought a widespread revulsion of feeling. Protests were general from the press, farmers, manufacturers, and foreign nations. As many as 38 countries filed protests with the United States State Department, these coming from Great Britain, France, Belgium, Italy, Austria, Spain, Switzerland, Denmark, Norway, Sweden, the Netherlands, and practically all the countries of Latin America. Manufacturers (particularly in the automobile industry) were quick to point out that the high tariff was threatening the stability of American foreign trade. The Senate, more sensitive to public opinion than the House, showed at once that its attitude was going to be highly critical. Senator Borah denounced the tariff as a repudiation of the Republican Party's election pledge to the farmer. The Democratic members were almost solidly aligned in opposition. In October, the Administration met two defeats. Democrats and Progressive Republicans refused to give the President the right to raise or lower rates at the instance of the Tariff Commission, claiming that this was a congressional prerogative. The same group voted to keep the Tariff Commission bipartisan instead of nonpolitical, as the Administration favored it. These were but preliminary skirmishes, but they indicated a senatorial independence that did not promise an easy victory for the House bill.

Tariff in Europe. In Europe, the tendency of freer commercial relations shown before the War was reversed in the post-war period. Import duties were increased to protect new industries and export duties were laid to protect raw materials; but advances were modest, though almost every European country had its protectionist camp. France increased her duties on agricultural products from an average of 22.5 per cent to an average of 23.8 per cent and, on industrial products, from an average of 9.2 per cent to an average of 10.7 per cent. German

increases were not much greater and Italian experiences were about the same, while in England, though there was a good deal of talk about protection, the country continued largely in its policy of free trade. The McKenna duties, levied during the War, were still on the statute books in 1929, but these were largely luxury taxes. In England, it appeared that the advance of protection was checked by the country's inability to work out a system of preferential rates within the empire without increasing the cost of living in the home country. Generally, the fear of war and the struggle over raw materials prevented the leveling of tariff barriers in Europe. See UNITED STATES, under *History*; European countries, sections on *History*; also FINANCE AND BANKING.

TARKINGTON, (NEWTON) BOOTH (1869-). An American author (see VOL. XXI). His later writings include *Penrod* (1914); *The Turmoil* (1915); *Penrod and Sam* (1916); *Seventeen* (1916); *The Magnificent Ambersons* (1918), for which he was awarded the Pulitzer Prize by Columbia University; and *Alice Adams* (1921); *Gentle Julia* (1922); *The Fascinating Stranger* (1923); *The Midlander* (1924); *Growth* (1927); *Plutocrat* (1927); *The World Does Move*, reminiscences (1928); and *Young Mrs. Greeley*, a novel (1929). His plays are for the most part light and entertaining. The most important are *The Man from Home* (1906); *Master Antonio* (1910); *Clarence* (1919); *The Wren* (1921); *The Intimate Strangers* (1921); *Rose Briar* (1922); *Tweedles and Magnolia* (1923); *Penrod Jashber* (1929).

TASMANIA, táz-mā'n-l-a A state of the Commonwealth of Australia consisting of the Island of Tasmania and several smaller islands. Area, 26,215 square miles; population in 1911, 191,211, in 1921, 213,780; in 1928, 212,043, a decrease of 72 per cent in 7 years. Hobart, the capital, including suburbs, had 52,000 inhabitants in 1928 (38,391 in 1911). Fruit growing is the only agricultural activity to show important increases. Pastoral pursuits are still comparatively unimportant (the wool clip of 1921-22 was smaller than that of 1913). The total mineral production for 1926-27 was valued at £1,301,000, and for 1925-26 £1,475,000. Gold, in 1913 yielded £141,876; in 1927, £20,646. The state's interest in the generating of cheap hydroelectric power augured an early industrial development. A plant created at Great Lake was designed to supply 70,000 horse power. The value of production for 1926-27 was. agricultural and pastoral, £4,815,000; value added by manufacture, £3,593,000. Imports and exports for 1913 were £1,025,081 and £522,865, for 1926-27, £9,406,273

£24,872,785, of which 29 per cent had been spent on railways, 24 per cent on roads and bridges, and 14 per cent on hydroelectric developments. In 1914, the debt was £12,265,012.

TASTE AND SMELL. The outstanding contribution of the decade was the revision of the classification of taste and smell qualities by H. Henning (*Zeitschrift für Psychologie*, vols. lxxiii, lxxiv, or *Der Geruch*, 1916). Experimental psychology had been content, in general, to accept Zwaardemaker's improvement on the old Linnæan classification of odorous qualities, and of the same investigator's results in the matter of olfactory mixtures and compensations. Henning, after trial of over 400 stimuli, proposed a new classification. There are, according to him, six fundamental qualities: fruity (lemon), putrid (H₂S), flowery (violet), resinous (frankincense), scorched (tar), and spicy (nutmeg). [The examples in parentheses are typical only.]

Dimmick has repeated the work of Henning and found that practiced subjects under properly controlled conditions give results which confirm those of Henning (*Psychological Review*, 1927, p. 321).

The treatment of taste on the part of Henning was no less radical. The German psychologist recognized the four fundamental qualities of sweet, sour, bitter, and salt, but insisted that they are connected by series of simple intermediate qualities, whose relation to the pure qualities is akin to that of the intermediate colors to the pure red, yellow, green, and blue of the color square.

TAXATION IN THE UNITED STATES. The most important fact about recent taxation history has been the great increase in revenue derived from it. Previous to the war period, revenue derived from customs played a significant rôle, afterward, such revenues were comparatively unimportant. In 1920, for example, receipts from customs made up one-nineteenth of the total, and while the figure reached its lowest point at that year, for 1927 the proportion was still only one-seventh. The following table shows the ordinary receipts of the Federal government for the years 1914, 1920, 1925, 1926, and 1927

Year	(Figures in thousands of dollars)				
	Total	Customs	Internal Revenue Tax	Miscellaneous	Others
1914	734,673	292,320	71,381	308,660	62,272
1920	6,704,414	323,537	3,956,936	1,442,213	981,728
1925	3,607,644	548,522	1,761,659	827,787	529,656
1926	3,908,458	579,717	1,974,104	862,668	491,969
1927	4,023,722	605,672	2,219,952	648,732	549,366

The subdivisions of the receipts under internal revenue for the years 1914, 1920, and 1927 were:

	1914	1920	1927
	\$	\$	\$
1. Income tax	60,710,197 52	3,956,936,003 60	2,219,952,000
2. Distilled spirits and beverages	226,179,689 76	197,332,105 84	21,196,000
3. Tobacco	79,986,639 68	295,809,355 44	376,170,000
4. Transportation, communication, and insurance	.	307,769,841 36	.
5. Luxuries (autos, candy, furs, etc.)	.	270,971,064 27	66,850,000
6. Estate inheritance	.	103,635,563 24	100,340,000
7. Excise tax on corporations	10,671,077 22	.	8,970,000
Capital stock of corporations, brokers, etc.	.	95,141,732 50	.
8. Stamps on legal documents	.	81,259,365 47	32,603,000
9. Admissions to amusements	.	89,710,525 59	17,941,000
10. Miscellaneous	2,461,289 78	9,014,694 50	48,572,000
Total	\$380,008,893 96	\$5,407,580,251 81	\$2,865,683,000

and \$9,437,371. Exports were chiefly wool, minerals, timber, fruit, and jam. Revenues and expenditures for 1913-14 were £1,238,085 and £1,235,514; for 1927-28, £2,962,687 and £2,867,605. The public debt on June 30, 1928, amounted to

From the accompanying table, it will be noted that in 1914 only the income tax, the taxes on spirits, beverages, and tobacco, and the excise taxes on corporations were in existence. All the rest were war measures. The Federal income tax

produced 69.2 per cent of all the revenue raised in 1920; in 1927 the Federal income tax produced 55.1 per cent of all the revenues raised.

Federal Income-tax Laws. The United States had an income tax during the Civil War which was abandoned in 1870. In 1894 the effort was made to reintroduce an income tax, but this could not be accomplished because of constitutional limitations. The Sixteenth Amendment as passed, read, "Congress shall have power to lay and collect taxes on income, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration." Shortly after, the Income-tax Law of 1913 was approved. The rates included a normal tax of 1 per cent applied to the net income of individuals and corporations. The surtaxes levied on individuals began with a 1 per cent rate on a net income of \$20,000, and rose to 6 per cent on the excess of incomes over \$500,000. Personal exemptions of \$3000 for a single person and \$4000 for a married couple were allowed. Corporations were allowed no exemptions. The outstanding features of the tax were, first, provision for collection at the source in order to prevent evasion, a method which gave great dissatisfaction and was abandoned in 1917 on the ground that it was unsuitable for a democratic country; secondly, permission for individuals' deducting only those losses incurred in trade; thirdly, definite limitations on the amounts which corporations could deduct for losses. The Income-tax Law of 1913 was in effect until Dec. 31, 1915, when the Income-tax Law of 1916 went into effect. There were two reasons for the new law: first, the customs duties had fallen off because of the decrease in the amount of goods coming from Europe, secondly, the old law needed to be clarified and changed in a number of ways.

After the entry of the United States into the War, the Income-tax Law of 1917 was passed and became effective as of Jan. 1, 1917. The new law was remarkable in two respects: first, the rates were higher than any country had ever imposed before; secondly, the act was exceedingly complex, because Congress had grafted the new law on the law of 1916 as an amendment. Both the normal and the surtax rates were increased. The normal rate imposed on individuals was 4 per cent, except on incomes between \$1000 and \$2000, on which the rate was 2 per cent. The normal rate on corporations was increased to 6 per cent. The surtax rates on incomes above \$5000 rose progressively from 1 per cent to 63 on the excess of \$2,000,000. The new law provided for "information at the source." The act specifically stated that income and excess profit taxes were not to be deducted, nor was interest on money borrowed for the purchase of tax-exempt securities. Dividends of corporations were to be taxed according to the rates obtaining in the year in which the profit or surplus was accumulated. The object of this provision was to make it impossible for corporations to refrain from declaring dividends in any one year in the hope that the rates of taxes would be lower in some future year. This provision was repealed in 1918 because of difficulties of administration.

In order to raise still greater amounts of revenue to meet the demands of the War, the Income Tax Law of 1918 was framed and continued in force until the Revenue Act of 1921 became effective. The normal rates were again raised, both for individuals and corporations, becoming

12 per cent on taxable income both for individuals and corporations, with the exception of a rate of 6 per cent on the first \$4000 of the taxable income of a citizen or a resident of the United States. In 1919 the normal rate was reduced to 8 per cent, with 4 per cent on the first \$4000 dollars of net income above the personal exemption. To obtain the total tax rate, the graduated surtax rates were added to the normal rate. The Income Tax Law of 1918 smoothed out certain inequalities in the taxing of corporations.

The Revenue Act of 1921. On January 1, the Revenue Act of 1921 went into effect, although some modifications were not put into force until a year later. These modifications included the abolition of the excess-profits tax. One important change in the law of 1921 related to business losses; if the business man suffered a loss in one period, it was permissible, under this new law, to set off that loss against net incomes realized in the two succeeding years. The income-tax rate on corporations was raised from 10 to 12½ per cent. The surtax rates for 1923 and for the first six months of 1924 were somewhat lower than those obtaining in 1921 and 1922.

Revenue Bill of 1924. The Revenue Act of 1924 contained the following provisions. There was a general reduction of 25 per cent on incomes earned in 1923, payable in 1924. The new normal rates on net incomes (less credits) were 2 per cent on incomes less than \$4000, and 4 per cent on incomes of \$4000 and not more than \$8000. Above \$8000 the normal rate was 6 per cent. The range of surtax rates was from 1 per cent on incomes between \$10,000 and \$14,000, to 40 per cent on incomes over \$500,000. Heads of families with incomes of \$5000 and over were permitted an exemption of \$2500 instead of the old rate of \$2000. Many excise taxes were repealed, including those on telegraph and telephone messages, candy, yachts and motor boats, carpets, rugs, trunks, purses, and drafts and promissory notes. Theatre tickets costing \$0.50 or less were exempted. Taxes on automobiles selling for less than \$1000 were exempted from the 3 per cent tax. The rates of estate taxes were increased to a maximum of 40 per cent on amounts of \$10,000,000 and over. A new gift tax was imposed with the same rates as the estate tax in order to prevent evasion of the estate tax by the making of personal gifts.

Revenue Act of 1926. Due to Federal economies and a desire on the part of the Administration to lift levies from incomes in the upper brackets, the Revenue Act of 1926 was passed. It was expected that this measure would reduce the Federal income by \$325,000,000 annually. The new law reduced inheritance-tax maximums from 40 to 20 per cent, allowed a credit of 80 per cent on inheritance taxes paid to the States, and granted exemptions from Federal taxation for estates from \$50,000 to \$100,000. In the income-tax schedules, the surtax on incomes between \$26,000 and \$100,000 was reduced, personal exemption of single persons was raised from \$1000 to \$1500, and of married persons, from \$2500 to \$3500. The normal tax rates were reduced from 2 to 1½ per cent on the first \$4000; from 4 to 3 per cent on the next \$4000; and from 6 to 5 per cent on the remainder. The corporation tax was increased from 12½ to 13 per cent for the year 1927, and 13½ per cent for the years following. The tax on auto trucks was removed; the tax on passenger cars was reduced

from 5 to 3 per cent. The gift tax, enacted in 1921, was abolished as were a number of excise and occupation taxes, including auto tires, jewelry, cameras, firearms, and pool and billiard tables. The only new tax imposed was for a 1-mill tax per gallon on beverages made from cereals. As a result of the 1926 revision, the internal-revenue collections increased only slightly, while receipts from customs and miscellaneous sources increased in greater proportions (see above table). There was a further revision in 1928, but it was concerned largely with technical readjustments.

The table below shows the percentage distribution of revenue from income tax, as between corporations and individuals, during recent years.

	Corporation Per cent	Individual Per cent
1922	47	53
1923	59	41
1924	56	44
1925	61	49

For the fiscal year 1928, the income tax yielded \$3,863,000,000. For the period July 1, 1928-Mar. 18, 1929, the income tax yielded \$1,356,291,006, as compared with \$1,324,055,083 for the same period in 1927-28.

The War-Profits and Excess-Profits Tax. Provision was made in the Act of 1910 for the levy of a tax of 12½ per cent on the profits of the manufacture of munitions. In March, 1917, this tax was made a general war-profits tax. In October of the same year, this war-profits tax was replaced by the excess-profits tax. In the following year, a law was provided under which the excess profits tax appeared in a new form as the war-profits and excess-profits tax. This law was applicable to corporations which had been organized for the sake of profit. The method adopted for arriving at the excess profits was to subtract from the total profits of the year the average rate of profits earned on the invested capital during the three years before the War began (1911-13), provided the rate of return had been as much as 7 per cent, and not more than 9 per cent. Hence, the base of the tax was the excess over an assumed normal profit. The law assumed that after allowance had been made for increases or decreases in working capital, an 8 per cent return of the amount of capital invested was fair in those industries in which the risk was not exceptional. The rates of the tax levied against the excesses were graduated from 20 to 60 per cent. After the War was over, business men felt that this tax was too heavy to be borne, and it was given up at the end of 1921. Aside from its being a matter of history, the chief interest in the tax lies in the effort to determine what might be called a normal return on capital invested.

Capital Stock Tax of Corporations. The revenue act of 1918 provided for a tax on domestic and foreign corporations. In 1921 the act provided for a payment by every domestic corporation of a special excess tax with respect to carrying on business. The corporation was obliged to pay \$1 for each \$1000 in excess of \$5000 of the average value of the capital stock as it was during the preceding year. Foreign corporations were not allowed an exemption, and had to pay at the same rate on all capital invested in the United States. This tax yielded a revenue of \$95,000,000 in 1920; but by 1927, levies had been reduced so that the revenue amounted to \$8,970,000.

Inheritance Taxes. These were provided for in the Revenue Act of 1916. They were to be levied on estates, after certain deductions had been made, and not on the shares of each heir. In this law, no distinction was drawn between direct and collateral heirs. If the estates were valued at less than \$50,000, they were exempt. The rates ranged from 1 to 25 per cent on estates valued at \$10,000,000 above the exemption. The law tried to provide against certain contingencies: (1) property which had been taxed once could not be retaxed within five years, so that if estates changed hands rapidly at the death of each successive owner, the property would not be largely consumed by taxes; (2) if property was proved to have been given away within two years before the death of the owner, the gifts

1926	55	45
1927	54	42
1928	59	41

were to be judged as made "in contemplation of death" and so were liable to the tax. It was difficult for the State to prove that such transfers of property were made in contemplation of death, and the courts consistently held that the burden of such proof rested on the State. The result was that the State did not often try to show that "transfers of property were in contemplation of death." The Federal inheritance tax yielded \$103,635,000 in 1920, and in 1927, \$100,340,000.

Taxation in States. The period following 1914 saw four noteworthy developments in State taxation. First, State taxes were increased; secondly, the income tax was increasingly used in different States; thirdly, State inheritance taxes grew; fourthly, returns from automobile taxes increased.

Increase in State Taxation. In 1910 the total receipts from State taxes were approximately \$254,000,000. By 1915 this had increased to \$352,000,000. In 1920 the grand total of State receipts from taxes was \$692,000,000. A part of this great increase was due to the decline in the purchasing power of the dollar. Some part of the increase in 1920 was due to the War, but the Federal government bore the main burden of the War expenditures. Of the total revenue received by the States in 1920, the receipts from taxes comprised about 78 per cent. Of the total receipts from taxes, the general property tax yielded about 45 per cent. Business taxes, including taxes on corporations, licenses, and insurance companies, yielded 23.3 per cent. Inheritance taxes yielded 8.6 per cent and taxes on corporations, 8.1 per cent. Non-business licenses yielded 9.1 per cent of the total income from taxes. The yield from miscellaneous taxes was 5.9 per cent. In 1927 receipts from State taxes totaled \$2,819,059,673, and in 1928 the total was \$2,775,276,956. By 1926, when receipts totaled \$1,655,495,000, the proportion from the general property tax had dropped to 22.7 per cent, special property and other special taxes had dropped to 16.2 per cent. Inheritance taxes yielded 5.5 per cent; income taxes, 2.3 per cent; bank and corporation stock taxes, 4 per cent. Two important items of State expenditure are education and highways. In the table below, the percentages of expenditure for these two items may be compared with the figures given above.

State Income Tax. The use of an income tax by States is not an innovation. Pennsylvania in 1840, Maryland in 1842, Massachusetts as a

PERCENTAGE DISTRIBUTION OF EXPENDITURES, 1910-20-26	1910	1920	1926
Total State Expenditure	100	100	100
Education	37.6	30.1	25.7
Highways	4.4	22.0	31.4
Other	58.0	47.9	29.9
Total local expenditure	100	100	100
Education	26.6	29.6	20.5
Highways	17.9	18.5	5.0
Other	55.5	51.9	74.5

colony in 1692 and as a commonwealth in 1821, South Carolina in 1868, Georgia in 1863, and other States experimented with income taxes. Interest in this form of taxation was reawakened by its revival. The Wisconsin tax, which went into effect in 1911, has been the best known. Massachusetts reintroduced the income tax in 1916. In 1919 four other States introduced the income tax, and in 1920 New York also put into effect a very thorough-going income-tax law. In 1927, Indiana passed a constitutional amendment allowing a State income tax. The majority of the States which have adopted income taxes used progressive rates.

State Inheritance Tax. There has been an increase in the number of States using inheritance taxation. In 1890 only six States had inheritance taxation, and this was levied only on collateral heirs. The taxation of direct heirs came later. By 1900, 21 States had adopted such taxation, by 1910, 38 States, and by 1928, only Alabama and Florida were without inheritance taxes. Practically all the States levying a direct inheritance tax use the progressive principle. Frequently, the rates increase more rapidly with remoteness of relationship. Where the relationship is collateral, the exemptions are usually low. Where the relationship is direct, the exemptions are much higher. During the post-war period, a number of States passed laws providing for reciprocity in exemption for estates of non-residents. In 1919 State inheritance taxation yielded 8.6 per cent of whole tax yield; in 1926, the proportion was 5.5 per cent.

Automobile Taxes. The returns to the States from the taxation of automobiles was rapidly becoming very important. The returns for all States, from registration, approximated \$150,000,000. Automobiles also were taxed in other ways than by registration licenses. In certain States and municipalities, individuals were taxed for licenses to drive for hire. In certain municipalities, there was a set tax on automobiles for the upkeep of roads. A number of States had taxes on gasoline, and while this sort of tax bade fair to yield increasingly large sums, it must be borne in mind also that automobiles entail increasing expenditures for the upkeep of roads and the construction of new highways. New York State passed a gasoline-tax law in 1929. See STATE FINANCES.

Municipal Taxation. In 1926 there were 250 cities with populations of 30,000 or over. These expended among them \$3,052,645,000 for that year. The per-capita-cost payment of all cities of 30,000 and over in 1926 was \$49.93, as compared with \$34.53 in 1915, and \$35.58 in 1919. Some of the important per-capita items of expense for these cities in 1926 were (1919 figures in parentheses): Schools, \$14.51 (\$6.88); general governmental expense, \$3.32 (\$2.22); police, \$7.84 (\$2.33); sanitation, \$3.91 (\$1.76); highways, \$3.03 (\$2.04). In 1926 the per-capita-cost for charities, hospitals, and corrections was \$2.29. Of the total receipts of \$2,738,961,000 for 1926, \$1,900,850,000 came from taxes. The

table that follows shows the per-capita receipts, governmental cost payments, and net debts of 146 cities (all of which had 30,000 or more population in 1903), for the years 1915, 1922, and 1926.

	Receipts	Cost Payments	Net Debt
1915	\$30.00	\$23.92	\$77.86
1922	53.57	42.93	97.57
1926	66.14	50.30	128.13

During the period subsequent to 1914, certain reforms were organized in municipal finance. First, many cities established a budgetary system. The overloading of expenditures by different departments was avoided by establishing a central purchasing department for the city. In New York City, the effort was made to avoid the duplication of records kept by different departments by centralizing the auditing and collecting departments under one control. Secondly, the cities issued large amounts of bonds. Many of them had great difficulty in meeting their interest and principal obligations when they fell due. Municipalities were encouraged to issue bonds during the period of high expenditures by their ability to issue tax-exempt bonds. The grand total of obligations of this sort had become very great and was rapidly increasing.

The limitations which many cities put on their borrowing power do not seem sufficient protection against very heavy municipal indebtedness for future generations. The whole problem of municipal borrowing requires careful analysis and necessitates the formulation of principles of future municipal finance.

For taxation in other countries, see articles on those countries. See also FINANCE AND BANKING, TAXES.

TAXONOMY. See ZOOLOGY.

TAYLOR, ALFRED EDWARD (1869-). A British philosopher (see VOL. XXII). He resigned his professorship of moral philosophy at St. Andrews in 1924 to accept a similar chair at the University of Edinburgh. In 1926, he held the Gifford lectureship at St. Andrews. His later works include *Essay in Recent Developments in European Thought* (1920); *St. Thomas Aquinas as a Philosopher* (1924); *Essay on Evolution* (1925); *The Influence of Platonism in Our Debt to Greece and Rome* (1925); *Essays, Catholic and Critical* (1926); *Plato, the Man and His Work* (1927); and *Commentary on Plato's Timæus* (1928).

TAYLOR, HENRY CHARLES (1873-). An American agricultural economist, born at Stockport, Iowa, and educated at Drake University, Iowa State College, the University of Wisconsin, and in Europe. In 1901 he was instructor in commerce at the University of Wisconsin, and from 1908 to 1919, chairman of the department of agricultural economics. From 1919 to 1921, he was chief of the Office of Farm Management in the U. S. Department of Agriculture; in 1921-22, chief of the Bureau of Markets and Crop Estimates; and chief of the Bureau of Agricultural Economics in 1922-25. In the latter year, he became research associate in the Institute for Research in Land Economics, and professor of agricultural economics at Northwestern University. He was the author of *Introduction to the Study of Agricultural Economics* (1905), and *Agricultural Economics* (1915).

TAYLOR, (JOSEPH) DEEMS (1885-). An American composer and critic, born in New York City. He received his musical education

from O. Coon in New York. In 1916 he was war correspondent of the New York *Tribune* and from 1917 to 1921, associate editor of *Collier's Weekly*. In 1921 he succeeded James Huneker as music critic for the New York *World*, which post he resigned in 1925 to give his entire time to composition. In 1927 he became editor-in-chief of *Musical America*. His compositions include 2 symphonic poems, *The Siren Song*, and *Jurgen*; the choral works with orchestra, *The Chambered Nautilus* and *The Highwayman*; an orchestral suite, *Through the Looking-Glass*; a rhapsody for chamber orchestra, *Portrait of a Lady*, a pantomime, *A Kiss in Xanadu*, an opera, *The King's Henchman* (New York, Feb. 17, 1927); and songs. He contributed a paper on music to *Civilization in the United States* (1921). Consult *Deems Taylor*, by J. T. Howard (New York, 1927).

TCHEREPNIN, NIKOLAI NIKOLAEVITCH (1873-). A Russian composer, born at Petrograd. He studied composition under Rimsky-Korsakov at the Conservatory there. In 1901 he became conductor of the Belaiev Symphony Concerts and professor at the Conservatory. During 1908-14 he was conductor for Diaghilev's Ballet Russe in Paris, also making extensive tours of all Europe. The next four years he lived in Petrograd and became director of the Conservatory at Tiflis in 1918, which post he resigned in 1921 to take up his residence permanently in Paris. His works consist of the ballets, *Armidas Pavillon*, *Narcissus*, *The Masque of the Red Death* (after Poe); *The Tale of the Princess Oulysa*, *Dionysus*, *A Russian Fairy Tale*, *The Romance of a Mummy*; symphonic poems, *Narcissus et Echo*, and *Le Royaume enchanté*; a prelude to Rostand's *La Princesse Lointaine*; a suite, *Le Jardin Enchanté*; *Scène dans la Caverne des Sorcières* (after Macbeth); *Fantaisie Dramatique Gavatte*; *Poème Lyrique*, for violin and orchestra; a piano concerto; a string quartet; several choral works with orchestra; choruses à cappella, piano pieces; songs; and duets.

TCHITCHERIN, GEORGY VASSILIEVICH (1872-). A Russian Communist diplomat and Commissary for Foreign Affairs. After being educated for a career in the diplomatic service under the Czarist régime, he became affiliated with the revolutionary movement and in 1908 was banished from Russia for his activities. He was imprisoned in Great Britain for his anti-war propaganda during the World War, and in 1918 expelled from that country. Returning to Russia, he became People's Commissary for Foreign Affairs, a position which he held until November, 1929. His resignation at that time was attributed to ill health, although he was known to be out of sympathy with the foreign policy of Josef Stalin, leader of the Communist majority. He represented Soviet Russia at the conferences of Genoa and Lausanne.

TEACHERS COLLEGE. See COLUMBIA UNIVERSITY.

TEASDALE, SARA (MRS. ERNST B. FLSINGER) (1884-). An American poet, born at St. Louis, Mo., and privately educated. She spent several years in travel. Her work has a charming lyric quality and fine rhythmic feeling. Her books include *Sonnets to Duse and Other Poems* (1907); *Helen of Troy and Other Poems* (1911); *Rivers to the Sea* (1915); *Love Songs* (1917); *Flame and Shadows* (1920); *Dark of the Moon* (1926). She edited *The Answering Voice: One Hundred Love Lyrics by Women*

(1917, new ed., 1928); *Rainbow Gold, Poems Old and New* (1922).

TEIRLINCK, HERMAN (1879-). A Belgian poet, novelist, and dramatist, who was born in Brussels. For many years he has been a professor in the University of Brussels and in the Institute of Decorative Arts there. He is a member of the Academy of the Flemish Language. His works, which are in Flemish, include *De Wonderbare Wereld* (1902); *De doolage* (1905); *Mijnheer Serjaanszoon orator didacticus* (1908); *Het woren Aapje* (1909); *Johan Dora* (1917), and the plays *De Drie graven* (1909); *Ik Dien* (1924); *De Man zonder Laps* (1925).

TELEGRAPHY. The World War spurred the engineers of the telegraph companies in the United States and the government telegraph bureaus in Europe to get as much service out of each line of wire as possible. To this end, there was a notable development, both in quantity and quality, of printing telegraph systems and multiplex telegraph systems and the use of vacuum-tube repeaters. During the War, the United States Signal Corps installed a very elaborate telegraph system in France, in which the printing telegraph was very generally used. By 1920 the Western Union Telegraph Company was using printing telegraphs for 80 per cent of its trunk-line traffic, and since that time their use has increased. Printing telegraph systems depend for their operation on the maintenance of absolute synchronism between two rotating elements at the respective ends of the line. This is obtained by special short impulses of current sent two or more times per revolution and by the use of tuning-forks. The printing systems in use are of two types, "continuous synchronism" and "start-stop." In the former, as its name implies, the devices are in continuous operation. In the latter, the device is started for each letter. Sending is accomplished by a machine using a prepared tape which is made up on a machine operated like a typewriter. From 50 to 60 words per minute may be sent by one machine, and by using multiplex combined with printing, as many as 800 messages per hour may be transmitted over one wire. The messages are received ready for delivery and the frequency of errors is reduced.

It became a regular practice to use telephone circuits simultaneously for telegraph purposes. By the use of induction coils to choke out the high-frequency telephone currents and of condensers to stop the direct currents of the telegraph, these two types of currents may be sent over the same wire simultaneously and separated at the receiving end. A single pair of wires may serve for two telegraph circuits and one telephone circuit. By means of carrier currents, the number of telephone conversations may be increased. In submarine cable telegraphy, machine sending and receiving became the usual practice and the use of vacuum-tube repeaters and amplifiers made it possible to carry messages direct from one city terminus to another without manual repeating in between; thus there is direct connection between New York and London.

Coöperation between the telegraph and telephone companies has brought the public the convenience of being able to send a telegraph message from the home to the telegraph office and again have it delivered at the other end by telephone. Thus it is said that "every telephone is a telegraph office." The telegraph companies have acquired the right to use the method of sending facsimiles of photographs or documents over their

wires, which has become popular with the illustrated newspapers. The enormous increase in the business and interest in the stock exchange has swamped the old ticker system of sending quotations and led to the adoption of a new system capable of handling twice as much business, which was installed in 1929.

Several new oceanic cables have been laid, notably those of the Western Union from New York to London and from Nova Scotia to the Azores, whence branches go to France, Germany, and Spain. These are constructed with the new permalloy wrapping, which enormously increases the speed of operation or capacity and accuracy of transmission of messages. This is on the same principle as the "loading" of telephone circuits

nautical miles in 1927. Increases of 18.7 per cent and 30.7 per cent are shown for number of employees and for salaries and wages paid, respectively. The total revenues in 1927 amounted to \$182,997,698, an increase of 20.5 per cent as compared with \$151,838,086 in 1922, while total expenses increased 26 per cent, from \$127,990,615 to \$161,216,941. The increase in value of plant and equipment was 30.6 per cent, from \$326,661,860 in 1922 to \$426,698,742 in 1927.

The accompanying table presents combined statistics for land and ocean telegraph systems, for 1927 and 1922. The Western Union Telegraph Company, which operates both land and ocean systems, is counted in this table as two companies.

SUMMARY, LAND AND OCEAN TELEGRAPHS (NOT INCLUDING WIRELESS): 1927 AND 1922 U. S. DEPARTMENT OF COMMERCE

	1927	1922	Per cent of increase or decrease (-)
Number of companies or systems	25	25	
Miles of pole line, total	256,809	252,991	1.5
Owned	193,578	195,655	-1.1
Leased	63,231	57,336	10.3
Miles of single wire, total	2,152,230	1,853,250	16.1

^a A nautical mile is equal to 6,080.2 feet, or 1.1515 statute miles

^b Operating expenses (maintenance, conducting operations, general and miscellaneous expenses), interest, taxes, all other expenses

with Pupin coils. Thus, it is possible to send eight messages simultaneously or 2000 letters per minute.

The recent growth of the International Telephone and Telegraph Company has been noteworthy. After securing control of and remodeling the telephone and telegraph system of Spain and several South American and West Indian countries, it acquired control of the All-American Cable Company and the Postal Telegraph, thus getting many cables to South and Central America and a complete land telegraph system in the United States.

Telephone, telegraph, and cable engineers have made an attempt to standardize the terms, definitions, phraseology, and methods of communication, the results of which have been published by the American Institute of Electrical Engineers in its *Standards*.

According to data collected at the quinquennial census of electrical industries taken in 1928, by the U. S. Bureau of Census, the total number of messages transmitted in 1927 by land and ocean telegraphs (not including wireless) amounted to 229,511,273, an increase of 20.1 per cent as compared with 191,121,333 reported for 1922. The mileage of single wire in use in 1927 was 2,152,230 exceeding by 16.1 per cent the mileage reported for 1922, 1,853,250. The increase in mileage of ocean cable was 36.3 per cent, from 76,711 nautical miles (a nautical mile being equal to 1.15 statute miles) in 1922 to 104,541

TELEKI, COUNT PAUL (1879-). A Hungarian geographer, professor of Austrian geography on the faculty of economics, Budapest University. He is a fellow of the Hungarian Academy of Sciences, vice president of the Hungarian Geographical Society, and a member of the German and Spanish geographical societies. His work, *The Cartography of the Japanese Islands*, was awarded the Prix-Jomard of the French Geographical Society in 1908.

TELEPHONY. In 1917 there were in the United States 11,716,000 telephones connected to 21,175 central stations by 28,000,000 miles of wire. They were used in that year for 60,000,000 messages per day or about six messages per day per telephone. In 1928 there were 19,000,000 telephones, or about 60 per cent of those of the whole world, and they were used for 76,000,000 messages per day. The capital invested in the telephone industry of the United States is about four billion dollars. The Bell System alone has approximately 430,000 stock holders and 450,000 employees.

Figures recently released by the U. S. Census Bureau on its quinquennial census of telephones show 18,522,767 telephones in the United States on Dec. 31, 1927, an increase of 29.1 per cent

since 1922. The number of telephones in every State had increased, the largest increases being for Florida, 103.7 per cent; California, 57.9 per cent; Louisiana, 57.5 per cent; and New Jersey 56.3 per cent.

In the same period, the industry's investment in plant and equipment grew from \$2,205,183,000 to \$3,548,874,000, a gain of 60.9 per cent. The single-wire mileage increased since 1922, by 71.3 per cent, amounting in 1927 to 63,836,182. The number of employees increased by but 20.3 per cent since 1922, while the number of calls in 1927 showed an increase of 28.3 per cent over 1922.

The World War was a great stimulus to the art of communication because of its importance to the military forces of the nation. This had its effect not only in bringing into regular practical service devices, such as the vacuum-tube repeater, which were previously in an experimental stage, but in expediting coordination of available facilities and improving the reliability and capacity of existing systems. Before the United States' entrance into the War, the vacuum-tube repeater (three-electrode thermionic tube) had been used in long-distance telephony, thereby making possible successful communication between New York and San Francisco (1916). To improve the reliability of the long-distance service and to prevent interruption by storms, most of the wires used in this service were combined into cables containing many pairs of wires, well insulated and protected, and strung on steel cables hung on the poles.

While good communication over long distances could be obtained over open-air lines by the use of repeaters, the introduction of cables called for a greater use of "loading coils." These are induction coils in series with each of a pair of wires at regular intervals in order to counteract the capacity of the wires, which in cables is great, and to increase the efficiency of transmission. Loading coils have been used since 1900, particularly for underground and submarine cables, but the more general use of cables since 1914 stimulated the development both of the quantity and quality of loading coils. New magnetic materials, such as permalloy, were developed for the core, and new forms, such as powdered iron alloy, came into use. For submarine cables permalloy tape is wound spirally around the wires to give continuous loading as distinguished from the "lumped loading" of coils. The increase in the use of telephones in the large cities brought about the development of cables containing 1200 pairs of wires of No. 24 B & S gauge is a cable having an outside diameter of 2½ inches, including the lead armor. In 1928 there was installed a cable having 1800 pairs of wires. This is a means of increasing the capacity of the underground duct laid and standardized in size many years before. The insulation of these wires consists of very thin paper of a special character, having very low specific inductive capacity and low losses.

Automatic telephone exchanges had been in service in isolated installations of moderate size for some years, but in the interval since 1920, their development and increased use has been remarkable. The independent companies used them first in locations where the service was not very complicated, such as towns with one central station. In 1921 the Bell System installed its first automatic central in Omaha and on Jan. 1, 1929, there were 3,500,000 dial or machine-switching telephones, or 18 per cent of the total. The

earlier installations, by independent companies, were of the so-called step-by-step system, but these were largely superseded by the panel-type which became the standard of the Bell system.

The principal and outstanding features of the panel system include a device on the subscriber's instrument for transmitting a series of a definite number of successive impulses of current corresponding to the number of the party called. A line finder, at the central station called, is a selector whose function is to find a terminal of a particular line on which a call originates out of a group with which it is associated, and to connect a "first selector" and a "sender" to that line. A comparatively large number of subscribers' lines may be served by a comparatively small number of line finders. The line finder finds the calling line and connects the selector and sender thereto. The sender switch receives the electrical impulses from a subscriber's dial on a decimal basis, stores them, and translates them to a nondecimal basis corresponding to the particular group of lines and trunks involved in the path of the call. The sender replaces the intelligence of the operator. The selector switch, controlled by the sender, has the duty of selecting a particular group of trunks and one trunk of that group. It has the same function as the switchboard plug and cord, which in a manual station can be plugged by the operator into any one of a number of jacks which are the terminals of trunks or lines. There are "district selectors," "incoming selectors," and "final selectors" in the circuit, in the order named, from the calling line to the called line. The district selector selects a trunk to the proper exchange, either the home or a distant exchange. The incoming selector selects a trunk to the outgoing board of the same exchange. The final selector selects the terminals of the line of the called party. The accompanying figure is an elementary diagram of the circuit and the principal devices in a circuit using the panel type of machine switching, from Morehouse, Croft, and Charlesworth, in the *Transactions of the American Institute of Electrical Engineers* (1923).

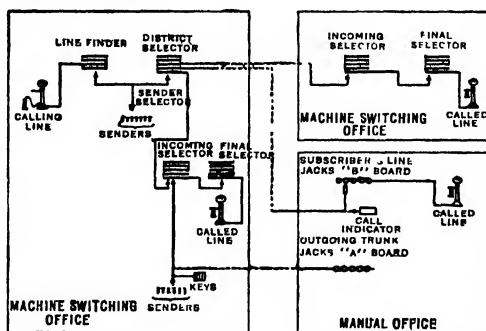

Diagram showing connections from machine switching to machine switching, machine switching to manual, and manual to machine switching

Transatlantic Telephony. Telephone conversations across the Atlantic Ocean inaugurated a regular commercial service in 1925, which since that time has found increased usefulness. At first it was only possible to communicate between New York and London, but the service has been extended until now it is possible to converse from any point in the United States, some points in Canada, and Mexico City to any place in eastern Europe. On Sept. 10, 1929, this service which

RECEIVING APPARATUS OF TELEPHOTOGRAPHY

Examining a newly-developed negative of a picture transmitted from Chicago to New York.
Seven minutes are required for the electrical transmission of pictures by wire.

had been restricted to certain hours was placed on 24-hour basis. The messages are sent by wire on land, then by radio from Rocky Point, L. I. to Cupar, Scotland, thence by wire. For west-bound messages, the radio route is from Rugby, England, to Houlton, Me. The original installation makes use of a long radio wave or low frequency, but recently an additional channel using a so-called "short wave" has been installed.

Telephone Cable. On land, there has been a great increase in the use of storm-proof overhead cables and underground cables. A new cable between New York and Chicago has 250 telephone channels and 500 telegraph channels. The practicality of the simultaneous use of the same conductor for telephony and telegraphy has led to a business arrangement between the American Telephone & Telegraph Co and the telegraph companies, which takes care of the increase of business without new wires and particularly without duplicate pole lines on the same route.

On Sept. 25, 1929, telephone connection was established between New York and Sydney, Australia through wire circuits and radio. The path of the transmission was from the office of the American Telephone & Telegraph Co in New York City over wire circuit to the company's short-wave transmitter at Lawrenceville, N. J., whence connection was established by radio with Baldock near London, and thence to Rugby by wire. From the Rugby transmission station, the message passed to Sydney, Australia. The distance between the stations was 15,000 miles.

In 1929 notable preparations were being made for a transatlantic cable providing an all-wire voice circuit between the two continents. Engineers at the Bell Telephone Laboratories in New York City were working on the development of the cable system to connect New York with London, which would involve long-distance lines radiating from each of these cities to the other parts of Europe and America. This telephone cable would handle but one conversation at a time and provide an additional channel for the transmission of messages in addition to the radio system, but with greater reliability. The new cable in process of development has a copper wire for an actual conductor in its centre and is wrapped around spirally with an alloy of nickel, cobalt, and iron, known as "perminvar." This serves as loading and overcomes the capacity of the cable which has hitherto retarded the transmission of voice currents and restricted such transmission over cables of limited length. For use in telegraphy, the Bell laboratories had developed an alloy called "permalloy" which was used in several high-speed telegraph cables, but the perminvar possessed a further advantage over permalloy, for it is affected to the same extent by the same variation in current, whether in a weak current or a relatively heavy one. In the telegraph cable, the current either flows or does not flow, but in telephony there is a constant variation or modification of current strength to take care of the modulations of the voice. This was claimed to be possible with a cable loaded with perminvar.

Carrier-current Telephony. This name was given to the method of sending telephone messages by means of radio waves but over the copper conductor by means of modulated high-frequency currents, similar to radio currents but of a frequency of the order of 10,000 to 50,000

cycles and sent over a wire. By this means, one normal voice message and six carrier-current telephone messages could be sent simultaneously over the same line and separated at the receiving end by suitable tuning devices such as are used in radio tuning. This secures privacy and avoids interference. In 1919 Baltimore and Pittsburgh were connected by a cable using this scheme, which provides simultaneous service for five telephone messages and duplex telegraph service over one pair of wires. By means of rectifier (detector) and amplifier tubes, these telephone messages may be sent on further on separate lines. Carrier-current telephony is now being used to send telephone messages over trolley wires and high-tension transmission lines without interfering with the usual service of the lines. In 1921 a telephone cable was put in service between Key West and Havana, a distance of 105 miles, for many years the longest submarine telephone cable in service. By means of carrier currents and multiplex telegraphy, several telephone and telegraph messages may be sent simultaneously, as described above. Messages from anywhere in the United States may be sent over this cable by direct connection.

The subject of inductive interference has been of great interest to the telephone and telegraph engineers. It relates to the unfavorable effects which the large currents and high voltages of power transmission lines have on communication circuits. These effects are threefold: electromagnetic, due to the large currents, electrostatic, due to the high voltages, and stray currents, due to grounds. This matter is still being given careful scientific study by a committee representing all concerned, with the expectation of devising regulations which would obviate the troubles and be fair to all concerned.

Relays. With the increasing distance covered and increasing complexity of systems, it becomes necessary to relay or amplify the messages every few hundred miles. For this purpose, the three-electrode vacuum tube has been most satisfactory and it is now an essential part of a telephone system. One of the feats of this long-distance work was the linking of 106 radio-broadcasting stations during the 1928 political campaign. The same speech was sent from one place to all the stations using wire telephone circuits.

Transmission of Facsimile Messages. In April, 1927, the American Telephone & Telegraph Co gave a practical demonstration of television in which persons in New York were able to see persons in Washington move and hear them talk. For details see RADIO.

Photographs Transmitted by Wire. In 1924 the American Telephone & Telegraph Company gave the first public demonstration of sending photographs by wire between Cleveland and New York and since that time regular commercial service is maintained between a number of cities. The method which involves the sending of facsimile messages or copies of photographs, documents, etc., has been so improved that now the telegraph companies are taking out licenses and supplying their newspaper customers with illustrations. This is accomplished by means of rotating cylinders at the respective ends of the line, held in exact synchronism by impulses of carrier currents. At the sending end, a transparent film picture is on the cylinder and a very fine beam of light is sent through the film and moved along the rotating cylinder in the manner used in talking ma-

chines, moving one inch axially for 65 turns of the cylinder. The beam of light varies in intensity, depending on the opacity of the various portions of the picture through which it passes, and impinging on a photoelectric cell, it causes a corresponding variation in the intensity of the current transmitted to the distant end. There a film is set on the cylinder behind a slit on which a steady light is thrown. The slit is opened wide when a large current is transmitted and closes for a weak current. The light through the slit traces a spiral line on the film, thick or thin, depending on the intensity of the current received, which, when developed, gives the gradations of the original picture. The general effect is that of a line engraving. A 5×7 picture is transmitted in 5 minutes, not including the time of development. Consult Jansky, *Principles of the Telephone*; Kingsbury, *The Telegraph and Telephone Exchange*, Miller, *Telephone Practice*; Mitchell, *Principles and Practice of Telephoning*. See TELEGRAPHY; RADIO TELEPHONY.

TELEVISION. As the word implies, this branch of electrical communication involves the viewing of distant scenes; as the public understands it, television signifies the transmission of moving pictures or scenes by some electrical means. The transmission of photographs over a wire or radio channel is comparatively simple; it involves "scanning" the photograph by some device which changes the intensity of illumination it receives into an electrical current of proportionate strength. This current is changed at the receiving end into a black-and-white record, sometimes photographically and sometimes by an actual drawing pen, the pressure or record of which is made to vary with the strength of the received current. There must necessarily be some arrangement for keeping the scanning and recording apparatus moving in synchronism with each other. At present, this process has been so perfected that the reproduced photograph can hardly be distinguished from the original; it takes perhaps five minutes to "send" the ordinary photograph, say six inches square. There are about 360,000 "elements" in such a picture.

To send pictures of moving scenes requires apparatus of an entirely different order of skilled design and refinement. The moving scene must be scanned and synchronously reproduced at the receiver, at least 16 times a second, for ordinary light intensities. The problem was undertaken by the engineers of the research staff of the Bell Laboratories, as a piece of deliberately planned, organized research. The various features of the problem were assigned to different groups of engineers, and the activities of these groups were so coordinated that on Apr. 7, 1927, a most remarkable demonstration of television was given to the public. The moving pictures were sent over both wire and radio channels, from Washington, D. C., and Whippany, N. J., respectively, to the laboratories in New York City, where a large audience both saw and heard the distant speakers.

Since the demonstration, other laboratories have claimed publicity in announcing their solution of the problem, but inspection of their apparatus and methods has shown them to be different forms of the pioneer work of the Bell engineers. At the sending end, a bright arc shines through the spirally arranged holes of a Plotnow disc on the face of the speaker. This spot of light makes 50 traverses, horizontally, in covering the face once. In the demonstration being

described, the disc rotated 18 times a second. A group of three powerful photoelectric cells received light reflected from the face and their response, suitably amplified, controlled the output of the transmitter.

At the receiving end, the picture-controlled energy was used to vary the intensity of light from a neon lamp. Two types of receiving apparatus were used in the demonstration, one in which the reproduced picture was about one inch square, for individual viewing, and the other a neon-lamp screen about two feet square suitable for large audiences. In the individual viewing apparatus, a neon lamp with electrodes about one inch square is excited by the picture-modulated power and thus glows alternately bright and dim. It is viewed by the observer through a Plotnow disc run synchronously with the scanning at the transmitter. The reproduction is very distinct and easily recognizable.

The large receiving apparatus consists of a neon-tube lamp about 100 feet long bent back and forth to make a screen about 2 feet square. It has one continuous inside electrode, and 2500 separate external electrodes each of which is in turn excited by the received picture wave. The commutator which distributes the picture-wave power to the various external electrodes is run synchronously with the scanning disc at the transmitter. In the demonstration, it was making about 45,000 contacts per second.

Whereas the Bell engineers completely solved the problem of television, there seems but little likelihood of its being available to the radio listener for some time. To give a picture with appreciable detail, the picture-modulated channel must be at least 50 kc wide, this consideration alone would seem seriously to limit the application of radio television. Before the scheme becomes available to the radio broadcast listeners, it appears that much simplification of apparatus and method must be developed.

TEMPERATURE. See METEOROLOGY.

TEMPLE, MOST REV. AND RT. HON. WILLIAM (1881-). A British prelate, Archbishop of York, son of the late Archbishop of Canterbury. He was born in Exeter, educated at Rugby and Balliol College, Oxford, and remained in Oxford as fellow and lecturer in philosophy at Queen's College (1904-08). He was ordained in 1909 and became chaplain to the Archbishop of Canterbury and headmaster of Repton School (1910-14). The following years were spent in London as rector of St. James's, Piccadilly (1914-18), and as Canon of Westminster (1919-21). He was Bishop of Manchester (1921-28) and Archbishop of York (since 1928). He was an active member of the Labor Party, president of the Workers' Educational Association (1908-24), and editor of *The Challenge* (1915-18), and *The Pilgrim* (1920-27). He received several honorary degrees and in 1915 was made honorary chaplain to the King. Besides many articles in magazines, his writings include *The Faith and Modern Thought* (1910); *The Nature of Personality* (1911); *Church and Nation*, the *Bishop Paddock Lectures*, delivered in New York (1915); *Plato and Christianity* (1916); *Mens Creatura: an Essay* (1917); *Issues of Faith* (1918); *Fellowship with God* (1920); *The Universality of Christ* (1921); *Life of Bishop Percival* (1921); *Christus Veritas* (1924); *Christ in His Church* (1925); *Personal Religion and the Life of Fellowship* (1926); *Essays in Christian Politics* (1927), and *Christianity and the State* (1928).

TEMPLE UNIVERSITY. A coeducational institution at Philadelphia, Pa., founded in 1884. The student enrollment increased from 3579 in 1915 to 9958 in 1928; the faculty increased from 290 in the earlier year to 587 in the latter, and the number of volumes in the library from 9200 to 41,606. In 1920 gifts and pledges were received to the amount of \$300,000 for a new building and in 1924 Conwell Hall, in memory of the former president, Russell H. Conwell, was dedicated, containing gymnasium, swimming pool, cafeteria, home economics department, class rooms, and administrative offices. In the same year, a new wing for the Samaritan Hospital was dedicated, providing improved facilities for the Medical School. In 1927, \$1,000,000 was received for a stadium to seat 25,000. Income in 1928 amounted to \$1,366,690. President, Charles E. Buery, LL D.

TENDERS. See VESSELS, NAVAL.

TENNENT, DAVID HILT (1873-). An American zoologist, born at Janesville, Wis., and educated at Olivet College and at Johns Hopkins University. He was lecturer in biology (1904-05), associate (1905-06), associate professor (1906-12), and professor (since 1912) at Bryn Mawr College. Professor Tennent was a member of various expeditions of the Carnegie Institution to the West Indies, Australia, and Japan. His published work was on the development of parasitic worms and experimental studies on hybridization of echinoderms. In 1920 he was elected a member of the National Academy of Sciences.

TENNESSEE. The thirty-fourth State in size (42,022 square miles) and the nineteenth in population; capital, Nashville. The population increased from 2,184,789 in 1910 to 2,337,885 in 1920 or by 7 per cent, estimated population, 1928, 2,502,000. The white population increased from 1,711,432 in 1885,993, the Negro population decreased from 473,088 to 451,758. The native whites increased from 1,692,973 to 1,870,515, foreign-born whites decreased in number from 18,459 to 15,478. The urban population of the State rose from 441,045 to 611,226; the rural decreased from 1,743,744 to 1,726,659. The growth of the principal cities in Tennessee was as follows: Memphis (q v.), 131,105 in 1910 to 162,351 in 1920; Nashville (q v.), 110,364 to 118,342; Knoxville, 36,346 to 77,818; Chattanooga, 44,604 to 57,895.

Agriculture. Tennessee is one of the minor cotton-producing States and while the boll weevil invaded the southwestern part in 1921-22, its effects have been restricted by the cold of winter. A comparison of acreage and production of cotton for several years is as follows: 1917, 882,000 acres, 240,000 bales; 1920, 840,000 and 325,000; 1923, 1,172,000 and 228,000, 1928 (estimated), 1,086,000 and 420,000. The number of farms increased 2.7 per cent, or from 246,012 in 1910 to 252,774 in 1920, and remained little changed at 252,669 in 1925. The acreage in farms decreased from 20,041,657 in 1910 to 19,510,856 in 1920, and to 17,901,139 in 1925. The improved land in farms totaled 11,185,302 acres in 1920. The value of all farm property rose 104.4 per cent, or from \$612,520,836 in 1910 to \$1,251,964,585 in 1920, but diminished thereafter to \$883,646,221 in 1925; the average value per farm was \$2490 in 1910, \$4963 in 1920, and \$3497 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in

1925, 148,027 were operated by owners; 324, by managers, and 103,718, by tenants. The corresponding figures for 1910 were 144,125; 826; and 101,061. White farmers in 1920 numbered 214,592 and colored farmers, 38,182. In 1925 the white farmers numbered 218,022; colored farmers, 34,647. There was a decrease in the colored population, 1910-20, amounting to 4.5 per cent, which affected the farm-labor situation. Farms reported as under mortgage, 32,264 in 1920, numbered 30,703 in 1925. Cattle numbered 1,161,846 in 1920; 986,083 in 1925; dairy cows, 609,360 in 1920; 358,530 in 1925. Sheep numbered 364,196 in 1920, compared with 795,033 in 1910; 289,577 in 1925, swine numbered 1,823,307 in 1920; 1,009,062 in 1925. The estimated production of the principal farms products in 1928 was as follows: Corn, 56,842,000 bushels; wheat, 3,714,000; oats, 4,042,000; potatoes, 4,085,000; tobacco, 88,459,000 pounds; hay, 1,840,000 tons. Comparative figures for 1913 are corn, 68,675,000 bushels, wheat, 8,400,000; oats, 6,300,000; potatoes, 2,432,000; tobacco, 64,800,000 pounds; and hay, 1,089,000 tons.

Mining. The principal mineral products of the State are coal, cement, and clay. From 1914 on, the production of coal remained fairly constant, as will be noted in the following figures: 5,943,258 tons in 1914, valued at \$6,776,573; 6,137,449 in 1916, \$7,522,445; 6,194,221 in 1917, \$13,592,998; 6,831,048 in 1918, \$19,305,203; 6,662,428 in 1920, \$26,778,000; 4,460,326 in 1921, \$14,932,000, 4,870,774 in 1922, 5,788,741 in 1926 \$10,975,000, 5,610,959 in 1928, \$9,694,000. The falling off in production in the years 1921 and 1922 was due chiefly to the coal-miners' strike in 1921. It will be noted that while the production of coal remained comparatively constant, the value in the years from 1917 to 1920 greatly increased. This is due chiefly to conditions resulting from the scarcity of coal and partly to the inflated condition of the currency. The copper output in the period starting with 1914 varied from 18,661,112 pounds smelted in 1914 to 14,556,278 in 1916; 10,727,803 in 1920; 14,226,232 in 1922; 18,601,586 in 1926. The total value of the mineral products of the State was \$39,296,668 in 1926, \$55,023,232 in 1920; \$37,134,899 in 1919, \$39,229,614 in 1918, and \$19,647,145 in 1914.

Manufactures. The industrial development of Tennessee was rapid in war time. There were, in 1920, six cities with more than 10,000 inhabitants and containing 19.2 per cent of the total population of the State. These reported, in 1919, 56.7 per cent of the value of the State's manufactured products. In 1909 there were in the State 4609 establishments; 4589 in 1919; 2157 in 1925; and 2098 in 1927. Persons engaged in manufactories numbered 87,672, 113,300, 107,570 and 114,968, respectively, the capital invested amounted to \$167,923,784 in 1909 and \$410,203,443 in 1919. The value of manufactured products in 1909 was \$180,216,548; in 1919, \$556,253,162, in 1925 to \$600,026,232; and in 1927 to \$614,040,524. The great increase in the value of products in and about 1919 was due largely to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but the increase in number of persons employed indicates clearly a decided growth in the manufacturing activities of the State. Knitted goods led manufactures in 1925.

Education. Tennessee has the same educa-

tional problems with which all the Southern States are obliged to contend: a large rural population combined with a large colored population. Increasing attention has been given to these problems in recent years, and much progress has been made in dealing with them. In 1923 the Legislature passed a measure which reorganized to a large extent the school system. The Department of Education was created to supersede the Department of Public Instruction and the head of the new department was called the Commissioner of Education rather than Superintendent of Public Instruction. The Legislature of 1921 passed a new county board-of-education law, under the provisions of which a county board of education consisting of seven members elected for a term of seven years, one member retiring each year, was created. The same Legislature enacted a measure extending the term of office of the county superintendent to four instead of two years. High schools increased in number and efficiency with improved conditions. They are under the control of the county board of education and operated under a special tax levied by the county, together with a State tax and a supplementary appropriation by the State. In 1923 there were 550 county high schools, 195 of them being standard four-year schools. The State system of elementary schools covers every county in the State. Since much the greater part of the total enrollment in the public schools is in the rural elementary schools, this phase of the State's educational system presents the most important problem and is most difficult of solution. Educational agriculture was organized in the State in 1917-18. At that time, there were courses in 12 schools with an enrollment of 189. This increased in 1923 to 64 schools with an enrollment of 1789. In 1913 the total enrollment in the county schools was 439,854 (371,948 white, 76,222 colored), while 69,399 white and 26,448 colored, a total of 95,487, were enrolled in the city schools. The total enrollment in the schools of the State in the academic year 1925-26 was 653,876, of this number, 600,584 were in the kindergarten and elementary grades and 53,292 in the high schools. According to color, the enrollment was white, 533,993, colored, 119,883. Expenditure for public day schools in 1925-26 was current, \$17,386,292, outlays, \$3,115,194. The percentage of illiteracy in the State decreased from 16.3 in 1910 to 12.6 in 1920; among the native white population, from 11.9 to 9.2, among the Negro, from 33.3 to 23.9 per cent. In the foreign-born white population, it increased from 8.2 per cent to 8.7.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were for maintenance and operation of State governmental departments, \$16,075,340 (of which \$3,883,158 was aid to local education); for interest on debt, \$901,873; for permanent improvements, \$10,963,010; total, \$27,940,223 (of which \$14,136,780 was for highways, \$4,532,159 being for maintenance and \$9,604,621 for construction). Revenue was \$26,534,880. Of this, property and special taxes formed 23.7 per cent, departmental earnings and charges for officials' services, 8.0 per cent; sales of licenses and taxation of gasoline, 43.5 per cent. Property valuation was \$1,720,780,504; State taxation thereon, \$3,441,561. Net State funded debt on June 30, 1927, was \$17,222,176.

Political and Other Events. The State displayed from time to time after 1914 the tendency

to shift toward Republican Party allegiance. Governor Hooper, Republican, was renominated in 1914 but was defeated by the Democratic candidate, Thomas C. Rye. In July, 1915, affairs of the city of Nashville went into the hands of a receiver. The city treasurer was arrested, charged with misappropriation of municipal funds. The Grand Jury in June returned indictments against the finance commissioner, the comptroller, and the assistant city treasurer. The latter officer fled to Australia. In 1916 Governor Rye and Senator McKellar were reelected. In the presidential voting, Wilson received 152,955 votes; Hughes, 116,257. A fire in Nashville, on Mar. 22, 1916, destroyed 600 buildings and caused a loss of more than \$1,500,000. Thomas C. Rye was reelected in 1918, and John K. Shields, Democrat, was reelected to the Senate. In 1918 A. H. Roberts was elected governor on the Democratic ticket, but in 1920 he was defeated by Alf Taylor, Republican. Taylor served one term and was defeated by Austin Peay, Democrat. For President, in 1920 Harding received 219,829 votes; Cox, 206,558. In 1922 Senator McKellar was reelected. Governor Peay was reelected in 1924 and 1926. He died in office in 1927, and was succeeded by Henry H. Horton, who was regularly elected governor, as the Democratic candidate, in 1928. The vote for President in 1924 was, Davis, 158,537; Coolidge, 130,882; LaFollette, 10,656. That of 1928 was Hoover, 195,338; Smith 157,343.

Legislation. In 1917 provision was made for a budget system and for a compulsory system of party primary elections. A general prohibition law also was passed. The Legislature of 1919 abolished the death penalty for murder in the first degree. Women were permitted to vote in presidential elections. A State police force was created, and a workmen's-compensation law was passed. The Legislature of 1923 passed a measure drafted by Governor Peay for the consolidation of the administrative departments under nine appointive heads. In 1925 a law was enacted prohibiting teachers in any schools supported wholly or partly by public funds "to teach any theory which denies the story of the Divine creation as taught by the Bible and to teach instead that man has descended from lower forms of animals." Under this statute was held at Dayton, in 1925, the widely noted trial of John Thomas Scopes, a young teacher of biology in Dayton.

TENNESSEE, UNIVERSITY OF. A nonsectarian, coeducational institution at Knoxville, Tenn., founded in 1794. The colleges of medicine and dentistry, and school of pharmacy are at Memphis, and a junior college at Martin. The student enrollment of the university increased from approximately 1200 in 1916 to 4504 in the autumn of 1928, in addition to which there were 1530 in the summer sessions at Knoxville and Martin. The faculty increased from about 200 members to 308 and the library from 40,000 to 96,173 volumes. In 1917 the State Legislature authorized a bond issue of \$1,000,000 for new buildings and improvements, and a tax levy of a half-mill for the support of the institution. The land grant amounted to \$400,000 in 1928 and the income for 1927-28 to more than \$2,240,000. Among the new buildings erected between 1914 and 1928 were an anatomy laboratory building at Memphis, a home economics laboratory, a practice house for the department of home economics,

and two experiment stations, one an insectary and the other an addition to the dairy cottage of the Middle Tennessee Experiment Station. Harcourt A. Morgan, B.S.A., LL.D., succeeded Brown Ayres, Ph.D., LL.D., as president in 1919.

TENNIS. Tennis vies with golf as the world's most popular sport. Practically every country has its national tennis tournaments, sectional competitions, intercity matches and club, college, and school contests. The contests for the Davis Cup, emblematic of the world championship, which began in 1900, have undoubtedly been responsible in large measure for the rapid progress tennis has made. Whereas, in the earlier years of the competition for the cup, only two or three nations participated, now a score or more have their teams entered. The list of winning countries also indicates the broadening trend of the game. The United States won the cup in 1900, 1902, 1913, and the period 1920-26; Great Britain triumphed in the period 1903-06 and in 1912; Australia scored in 1907 and 1908; Australasia was victor in 1909, 1911, 1914, 1915, and France swept the courts in the three years, 1927-29.

René Lacoste, Henri Cochet, and Jean Borotra of France and William T. Tilden, II, of the United States are the world's outstanding tennis players, as judged by their showings in Davis Cup and other international tourneys, as well as in national championship competitions. The most prominent women players since the retirement of Mlle. Suzanne Lenglen of France in 1927, to join the professional ranks, have been Miss Helen Wills of the United States, and Miss Ethleen Bennett of England. The Wightman Cup, emblematic of the women's world championship, was won by the English team headed by Miss Bennett in 1928.

In 1929 H. Cochet, the French player, won the Wimbledon championship, the outstanding men's amateur event of the world. Miss Wills of California continued her supremacy among the women, attained when Miss Lenglen retired, by triumphing both at Wimbledon and in America. Tilden gained the United States honors from a brilliant field, and Karel Kozeluh, the Czechoslovakian contestant, defeated Vincent Richards for the United States professional title, the third annual event of its kind.

Court tennis, squash, and racquets, all branches of tennis, have not the wide appeal of the last-named sport, their popularity being confined to the more exclusive clubs in the larger cities of the United States. Pierre Etchebaster of France won the world court-tennis championship in 1928 from George Covey of England. An American team defeated a British aggregation in an international racquets match in New York City in 1928, but two of the losing team, J. C. F. Simpson and C. N. Bruce, later captured the United States doubles title. See OLYMPIC GAMES.

TERAUCHI, MARSHAL. See JAPAN, *History*.

TERMAN, LEWIS MADISON (1877-). An American psychologist born in Johnson County, Ind., and educated at Clark University. After teaching in the California State Normal School in Los Angeles, he went to Stanford University and became professor of education there in 1916. During the World War, he was a member of a board of five psychologists appointed to revise the army mental-test methods for use in schools. He wrote *The Teacher's Health* (1913);

The Hygiene of the School Child (1914); *The Measurement of Intelligence* (1916); *The Stanford Revision of the Binet-Simon Intelligence Scale* (1916); *The Intelligence of School Children* (1919); *The German Group Test* (1920); *Genetic Studies of Genius*, 2 vols. (1925-26). He edited the *Measurement and Adjustment Series*.

TERMIER, PIERRE (1859-). A French mineralogist and member of the Academy of Sciences. At various periods he served as professor in the School of Mines, as Inspector General of Mines, and as director of the Geological Survey of France. He wrote *La joie de connaître; suite de A la gloire de la terre, souvenirs d'un géologue* (1926), and numerous articles on geological subjects.

TERRY, DAME ELLEN ALICIA (1848-1928). An English actress (see VOL. XXII). In 1916 Miss Terry made her only appearance in the films, in a picture called *Her Greatest Performance*. Her last regular stage appearance was made in June, 1919, when she took the part of the nurse in *Romco and Juliet* at the Lyric Theatre in London. In 1922 the University of St. Andrews, Scotland, granted her the honorary degree of LL.D. and in 1925 she received the Grand Cross of the Order of the British Empire. Her 80th birthday was celebrated in February, 1928, and in the following July she died after a brief illness, at Small Hythe, near Tenterden, Kent, recognized everywhere as one of the great women of the stage.

TESCHEN, ZIPS, AND ORAVA QUESTIONS. The disposition of these three districts, the first up to 1918 part of Austria and the second and third of Hungary, occasioned a serious dispute between Poland and Czechoslovakia. The Duchy of Teschen, embracing only an area of 2282 square kilometers (881 square miles), but possessing great mineral wealth of coking and gas coal, and situated on the more important road and railway arteries of Central Europe, occupied a place of first rank. In 1910 there were settled there 233,850 Poles, 115,604 Czechs, and 76,916 Germans. It is important to note that the Polish settlements, largely in the mining areas, dated back only to the last half of the nineteenth century and were made up of immigrants from Western Galicia. Poles were in the majority in the centre and east; in the west, the Czechs were most numerous, while the Germans were settled in the towns (Bielitz, Teschen, etc.), and formed the middle class. Ethnical considerations were therefore far from simple; the problem was further complicated by the economic importance of the duchy. It forms part of the vast Silesian coal field, and there were mined in 1913 7,594,865 tons of coal and 1,146,580 tons of coke.

Such was the basis of the protracted struggle for possession before the Peace Conference, and after. On the grounds of history and economic necessity (Karvin coal supported the great Czech iron and chemical industries at Witkowitz, Moravská, Ostrava, etc.), while the Oderberg-Jablunka railway was vitally necessary for the maintenance of communications between Slovakia and the West), the Czechoslovaks could make out a convincing case. The Poles, on the other hand, supported their claims on ethnical grounds, although these were disputed, as the Polish population was relatively unstable. Other considerations had, however, entered into the controversy. On the collapse of Austria in October, 1918, two local Silesian organizations took possession of the

duchy and effected a common administration. On Nov. 5, 1918, control was divided between the two, the Czechs establishing themselves in the smaller western portion east of Freistadt, and the Poles in the remainder. In January, 1919, against Czechoslovak protests, Polish troops occupied eastern Teschen. The Czechs, on their side, took Oderberg after a skirmish; an armistice on February 5 laid down a new line more favorable to Czechoslovakia this time.

In view of all these complications and the inability of an Inter-Allied Commission, at work on the spot, to suggest a solution, the Peace Conference finally decided to permit the two governments to settle the question between themselves. As they were unable to do this, the Supreme Council, on Sept. 27, 1919, ordered plebiscites in the whole duchy as well as in Zips and Orava. By this time, the contested region was filled with soldiers, customs officials, and a general ill will. The tension increased, aided by hostile propaganda in both countries, with the result that rioting and strikes grew in frequency. Amid such a state of affairs the holding of the plebiscite was found impracticable and the Inter-Allied Commission so reported to the Supreme Council (July, 1920). An appeal to the contesting powers again revealed a deadlock. This time, in the interests of European peace, the Supreme Council called upon the Council of Ambassadors to effect a settlement (July 11, 1920). On July 28, in accordance with the decision of the Supreme Council, the Council of Ambassadors announced its findings for Teschen, Zips, and Orava. The boundary as finally laid down gave Czechoslovakia the Oderberg-Jablunka line and all territory west of it, including the mines of Ostrau-Karvin and the city of Freistadt. The town of Teschen was to remain with Poland, which also acquired the German enclave of Bielitz in the midst of a rich agricultural region. The necessity for dividing a region that was economically and culturally a unit was unfortunate, but the nationalistic fevers awakened by the World War made any other solution impossible. The contest was finally closed December, 1923, when, on the appeal of Poland, the Permanent Court of International Justice reviewed the proceedings and pronounced in favor of the boundary line of July, 1920.

Involved in the same controversy was the disposition of the counties of Zips and Orava (formerly of Hungary). Northwest Zips and northeast Orava were claimed by Poland on historical and ethnical grounds. In 1910, there were in Orava 2000 Magyars, 1528 Germans, 59,096 Slovaks, and 16,120 "others" (the Magyar way of referring to Poles); in Zips there were 18,658 Magyars, 38,432 Germans, 97,077 Slovaks, 12,327 Ruthenes, and 5629 "others." Both countries were occupied by Czechoslovakia in November, 1918, on the ground that the inhabitants of the highlands were not ethnically Polish; but the difficulties attending the Teschen solution prevented a settlement there. The decision of the Council of Ambassadors of July 28, 1920, gave Poland northeastern Orava, with the line of demarcation south of the main Carpathian divide, and northwestern Zips, with the line north of the divide. Economically, the partition seemed justified because of the close connection between the frontier villages and Galicia, but on ethnical grounds, there appeared more reason for union with Czechoslovakia. See POLAND, under *History*.

TEWFIK, tū'fik, AHMED PASHA (1845-). A Turkish statesman, born at Constantinople.

He served in the army for many years, resigning in 1870 to enter the translation bureau of the Government. During the Russo-Turkish War, he acted as political agent for the army and later became Turkish Minister at Athens. In 1884, he was Ambassador at Berlin, and was recalled in 1895 to be Minister of Foreign Affairs. He was Grand Vizier in 1909, 1912, and 1918, and the government which he formed in 1918 excluded all the members of the Committee of Union and Progress. He resigned in March, 1919, but returned to power in October, 1920, remaining until November, 1922, when the Sultan, Mohammed VI, was deposed. He then fled to Egypt.

TEXAS. The first State in size (265,896 square miles) and the fifth in population; capital, Austin. The population increased from 3,896,542 in 1910 to 4,663,228 in 1920, or by 19.7 per cent; estimated population, 1928, 5,487,000. The white population increase from 3,204,848 (1910) to 3,918,165 (1920); Negro, from 690,049 to 741,694; native white, from 2,964,864 to 3,557,646; and foreign-born white, from 239,984 to 360,519. Urban population mounted from 938,104 to 1,512,689; rural from 2,958,438 to 3,150,539. The growth of the principal cities was as follows: San Antonio (q.v.), 96,614 in 1910, 161,379 in 1920, Dallas (q.v.), 92,104 and 158,976; Houston (q.v.), 78,800 and 138,276; Fort Worth (q.v.), 73,312 and 106,482; El Paso 39,279 and 77,560; Galveston 36,981 and 44,255, and Beaumont 20,640 and 40,422.

Agriculture. As Texas is the chief cotton-producing State, agricultural conditions have been much affected by the ravages of the boll weevil, which made its first appearance there in the nineties. The insect continued to spread over the State, but, while the cotton yield was low in the years 1918-21, the production of the State has since more than doubled. This will be noted from a comparison of the acreage and production for several years: in 1913, 12,597,000 acres and 3,945,000 bales; 1918, 11,233,000 and 2,697,000; 1921, 10,745,000 and 2,198,000; 1922, 12,125,000 and 3,290,000; 1926, 18,374,000 and 5,631,000; 1928 (estimated), 17,766,000 and 5,150,000. The number of farms increased 4.4 per cent or from 417,770 in 1910 to 436,033 in 1920, and rose farther to 465,646 in 1925. The acreage of land in farms increased from 112,435,067 in 1910 to 114,020,621 in 1920, but thereafter decreased to 109,674,410 in 1925. The improved land in farms totaled 31,227,503 acres in 1920. The value of farm property doubled, rising from \$2,218,645,164 in 1910 to \$4,447,420,321 in 1920, but declined to \$3,471,867,460 in 1925. The average value per farm was \$5311 in 1910, \$10,200 in 1920, and \$7456 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 182,976 were operated by owners; 1445, by managers; and 281,225, by tenants. The corresponding figures for 1910 were 195,863; 2332; and 219,575. White farmers in 1920 numbered 357,249, and colored farmers, 78,784. White farmers numbered 383,920 in 1925, and colored farmers, 81,726. Farms reported as under mortgage, 69,940 in 1920, numbered 62,106 in 1925. The total number of cattle was 6,156,715 in 1920; 5,845,918 in 1925; there were 1,463,707 dairy cows in 1920; 731,491 in 1925. Sheep numbered 2,573,485 in 1920; 3,137,129 in 1925; swine, 2,225,558 in 1920; 1,166,253 in 1925. The estimated production of the principal farm

products in 1928 was as follows: Corn, 99,162,000 bushels; wheat, 22,176,000; oats, 35,751,000; barley, 3,276,000; potatoes, 2,691,000; sweet potatoes, 8,284,000; rice, 7,308,000; hay, 941,000 tons; and peanuts, 78,000,000 pounds. Comparative figures for 1913 are corn, 163,200,000 bushels; wheat, 13,650,000; oats, 32,500,000; barley, 168,000; potatoes, 2,340,000; rice, 9,696,000; and hay, 464,000 tons.

Mining. Through the remarkable development of its oil fields, Texas has become in recent years one of the most important of the mineral-producing States in the value of its products. In 1926 it ranked fourth in value of minerals produced, and third in petroleum. Petroleum production in the period starting with 1914, was as follows: 20,068,184 barrels in 1914, valued at \$14,942,848; 24,942,701 in 1915, \$13,026,925; 27,644,605 in 1916, \$25,760,335; 32,413,287 in 1917, \$42,891,555; 38,750,031 in 1918, \$74,867,537; 96,868,000 in 1920, \$313,781,000; 106,166,000 in 1921, \$162,663,000. 166,916,000 in 1926, \$308,700,000, 217,389,000 in 1927, \$248,550,000; 257,320,000 in 1928, \$236,300,000. The great increase in production in these years resulted from the development of important new petroleum fields. The increased value in the two years 1922-23, while due largely to the increase in the output, reflected also the decreased purchasing power of money resulting from inflation, with consequent higher prices. The output of natural gas is very valuable. In 1914 this amounted to 13,433,639 M. cubic feet, valued at \$2,469,770; 1916, 15,809,579, \$3,143,871; 1920, 37,063,000, \$7,042,000; 1921, 44,504,000, \$8,893,000; 1926, 175,392,000, \$28,165,000. Natural-gas gasoline after 1916 became an important product. In that year, the output was 1,292,811 gallons; in 1918, it was 7,326,122 gallons; 1920, 32,956,028; 1926, 243,093,000; 1927, 320,723,000. In 1928 the total quantity of coal and lignite produced in Texas was 1,182,034 net tons, valued at \$1,589,000 of which amount 117,849 tons, valued at \$377,000, was bituminous coal and 1,064,185 tons, valued at \$1,212,000, was lignite. Texas also produces sulphur, cement, clay, mercury, asphalt, gypsum, and other minerals. The total value of the mineral production in 1927 was \$374,503,420, compared with \$420,586,730 in 1926; \$351,211,629 in 1925, \$371,250,979 in 1920; \$190,563,015 in 1919; \$110,306,367 in 1918; and \$30,363,426 in 1914.

Manufactures. Texas has increased greatly in importance as an industrial State, especially in the period since 1914, in which petroleum refining has increased to an extraordinary extent. There were, in 1920, 30 cities having more than 10,000 inhabitants. These formed 23.4 per cent of the State's population, and produced 40.8 per cent of the value of the State's manufactured products. There were in Texas in 1909, 4588 manufacturing establishments; 5724 in 1919; 3003 in 1925; and 4065 in 1927. Persons engaged in manufactories numbered 84,575, 130,911, 106,772, and 116,763, respectively; and capital invested amounted to \$216,875,579 in 1909, and \$585,776,451 in 1919. The value of products in 1909 amounted to \$272,895,635; in 1919, to \$999,995,796; in 1925, to \$1,237,674,338; and in 1927, to \$1,206,579,962. The large increase in the value of products about 1919, was due chiefly to industrial conditions incident to the War, and cannot be used to measure the growth of manufactures between the industrial census of 1914

and that of 1919; but the increase in number of persons engaged in manufactories clearly indicated a decided growth in the manufacturing activities of the State. The refining of petroleum is the first industry in point of value of product. As this industry did not develop to any extent till after 1914, the only available figures are those of 1919, in which year the product amounted to \$214,757,000 in value. Slaughtering and meat packing come second in importance, with a value of \$42,530,000 in 1909; \$125,364,000 in 1919; and \$79,208,777 in 1925. The manufacture of cottonseed oil and cake is third, with \$29,916,000 in 1909; \$102,112,000 in 1919; and \$63,308,000 in 1927. Flour-mill and gristmill products, in fourth place, amounted to \$32,485,000 in 1909; \$73,064,000 in 1919; and \$54,528,293 in 1925.

Education. The chief educational problems of Texas come from its great expanse and widely scattered population. In the course of its more recent sessions, the Legislature has passed many laws, which resulted in improved conditions. The Better Class Amendment to the State Constitution, passed in 1918, removed all limit on the rate of local tax which a district may vote for support of its schools. Numerous campaigns for education, carried on from time to time, aroused the entire State to greater interest in all the schools, and particularly in the rural schools. The salaries of public-school teachers were increased on an average of 54 per cent in 10 years, and with this increase came improvement of the qualifications of teachers. With better support, the schools increased the length of their terms. Many improvements were made in rural schools, especially in the direction of consolidation and the transportation of pupils. Considerable advance was made in vocational education under the Smith-Hughes Law, which gives Federal aid to States. A system of free textbooks was introduced, approved, and established; and a plan of classifying and affiliating elementary schools was initiated. A campaign was waged for the passage of a law providing for the establishment of a county unit system of managing schools. Schools for Negroes and Mexicans were greatly improved. Recognition for the work of women on equal terms with that of men progressed. The enrollment in the public schools in 1909-10 was 821,631, in the elementary schools in 1925-26, 1,015,951; and in the high schools, 194,176. The expenditure for public day schools in 1925-26 was: current, \$54,197,384; outlays, \$10,930,635. The percentage of illiteracy in the State decreased from 11.6 in 1910 to 9.6 in 1920; in the native white population, from 3.7 to 2.5; among the Negro, from 31.4 to 23.4. In the foreign-born white population it increased from 28 per cent to 33.3.

Finance. State expenditures in the year ended Aug. 31, 1927, as reported by the U. S. Department of Commerce, were, for maintenance and operation of governmental departments, \$56,648,830 (of which \$22,465,370 was aid to local education); for interest on debt, \$202,425; for permanent improvements, \$13,923,107; total, \$70,774,362 (of which \$19,704,148 was for highways, \$8,255,390 being for maintenance, and \$11,508,758 for construction). Revenues were \$78,687,485. Of this, property and special taxes formed 33.6 per cent; departmental earnings and charges for officials' services, 5.0 per cent; sales of licenses and taxation of gasoline, 41.2 per cent.

Property valuation was \$3,905,050,651; State taxation thereon, \$26,163,839. Net funded State debt on Aug. 31, 1927, was \$4,364,488.

Political Events. Texas remained overwhelmingly Democratic until the upset due to the Smith candidacy for President in 1928. The Ku Klux Klan acquired great strength in 1922, and took an important part in deciding elections. In 1914, James E. Ferguson was elected governor. He was reelected in 1916, and Senator Culberson was reelected. For President, Wilson received 285,909 votes; Hughes, 69,949. In August, 1917, impeachment charges were filed against Governor Ferguson for alleged misappropriation of public funds. The House voted for the impeachment of the Governor on 21 different counts. The Senate, after trial, removed the governor and disqualified him from holding any office in the State. He had offered his resignation a few hours before. Of the 10 charges sustained, nearly all related to the misuse of trust funds and public money. The governor nevertheless, ran for the office again in 1918. He was defeated by the former Lieutenant Governor, W. P. Hobby, who had succeeded him. Morris Sheppard was reelected to the United States Senate in 1918. Pat M. Neff was elected governor in 1920. For United States Senator in 1922, Earl B. Mayfield won a hotly contested primary with support from the Ku Klux Klan, and was elected. Governor Neff was reelected. In 1924 Davis, for President, received 484,605 votes, Coolidge, 130,023; La Follette, 42,881. The Ferguson faction elected Myriam A. Ferguson, the removed governor's wife, as chief executive of Texas. Dan Moody, backed by the anti-Ferguson faction, was elected governor in 1926. A resurvey to settle the disputed Oklahoma boundary was ordered in 1926 by the United States Supreme Court. In the 1928 presidential election, Hoover received 367,036 votes; Smith, 341,032. Dan Moody was reelected governor.

Legislation. The Legislature of 1919 submitted to the people the question of holding a constitutional convention. It also submitted a constitutional amendment for woman suffrage. Both were defeated. In 1921 the Legislature passed an amendment forbidding Japanese and Chinese to hold land in Texas except under certain conditions; also one to make more effective provisions for conserving the State's natural resources. It also proposed a constitutional amendment restricting the suffrage to native-born or naturalized citizens and authorized absentee voting in primary elections. The commission form of government was extended to towns with less than 5000 population, and a constitutional amendment was passed increasing the amount of the pensions paid to Confederate soldiers and sailors and their widows. The Legislature of 1923 enacted a measure substituting electrocution for hanging. It rendered the prohibition law more stringent, and passed an enabling act providing an increase in pensions for Confederate veterans. In 1925 a measure of relief from disabilities was passed for the benefit of ex-Governor Ferguson, whose partisans had control. This amnesty was repealed in 1927. A law limiting child labor was enacted in 1925. Constitutional amendments, submitted in 1927, provided increased taxing power to the Legislature, eliminated fee remuneration for county officers, and revised State salaries. A law enabling the Democrats to exclude Negroes from their

primaries was recast in 1927, having been invalidated in its earlier form by the United States Supreme Court.

TEXAS, UNIVERSITY OF. A coeducational State institution, founded in 1881, and opened in 1883. The main university is at Austin, the medical branch at Galveston, and the college of mines and metallurgy at El Paso. The student enrollment increased from 2576 in 1914 to 6209 in 1928. The faculty increased during this period from 191 to 432, and the library from 110,000 to 407,552 volumes. The productive funds of the University aggregated \$21,060,521 in 1928. The Genaro Garcia collection of materials in the Latin-American field was secured in 1921 at a cost of \$104,539. The department of journalism was opened in 1914; the department of library science in 1918; and the school of business administration, which in 1912-13 was organized as a department of the College of Arts and Sciences, became a separate school in 1922-23. The College of Mines and Metallurgy was created in 1919, following the passage of an act by the State legislature constituting the State School of Mines and Metallurgy, a branch of the University of Texas. In 1925 a biology building was dedicated, and a recitation and classroom building, in the following year. President, Harry Vandell Benedict, Ph D., LL D.

TEXAS FEVER. See VETERINARY MEDICINE.

TEXAS TECHNOLOGICAL COLLEGE. A State coeducational institution at Lubbock, Tex., opened in 1925. The student enrollment for the year 1927-28 was 1682; for the summer session of 1928, it was 985; and for the autumn term, 1808, of whom 1095 were men, and 713 women. The curriculum was organized into four separate schools; Liberal arts, with 1122 students, in the autumn of 1928; engineering, with 403, agriculture, with 124, and home economics, with 158. The faculty numbered 127. The appropriations for the college since its founding, amounted to \$3,400,000, of which \$767,000 represented the regular appropriations for the year ending Aug. 31, 1929. The library in 1928, contained 12,441 volumes. An engineering building was completed on the campus during the year, and a chemistry building was under construction. President, Paul Whitfield Horn, M. A., LL D.

TEXTILE MANUFACTURING. The American textile industry in 1927, as in earlier census years, according to the United States Census, ranked second among the various manufacturing industries of the country when considered on the basis of the total value of the product. This value was represented by the vast amount of \$8,950,437,000, which was the output of 26,843 establishments with the total number of wage earners averaging 1,694,416. In this total production textile fabrics and materials aggregated \$4,933,282,000, articles from textile fabrics for personal wear \$3,456,304,000 and other textile fabrics \$560,888,000. In 1919, a year of abnormal activity, the value of the product attained \$9,210,934,000, representing the output of 28,451 establishments with the number of wage earners averaging 1,610,003. The maximum production, however, was attained in 1923, when as the accompanying table (Table I) indicates, 26,763 establishments with 1,715,293 wage earners reported an output valued at \$9,462,282,000. All of these years, however, represented a vast gain over 1914 when 23,350 establishments

TABLE 1—U. S. CENSUS STATISTICS OF THE TEXTILE INDUSTRIES

NOTE.—The value of the products for the group as a whole, and to some extent also for the subgroups and for several of the individual industries, involves duplication owing to the use of products of one branch as material for another

Year and industry	In thousands of dollars					
	Estab- lish- ments	Wage earners (average number)	Primary horse power	Wages	Cost of materials	Value added by manu- facture
The group as a whole						
1914	23,350	1,505,912	2,717,078	675,783	2,013,738	3,444,810

with 1,505,912 wage earners had a production valued at \$3,444,810,000.

The year 1928 following the census year witnessed decreased activity in practically all branches of the textile industry, except silk manufacture and rayon production, as compared with 1927. In the cotton-spinning industry activity declined from 104.7 per cent of its single-shift

activity after 1914, though not maintained in every industry, and this is indicated by Table III which shows the new textile mill construction from that time. It must be remembered that usually new mills constructed in the United States are large affairs, as modern conditions of profitable operation call for large units with improved equipment.

* Bales of 478 pounds lint, except American, which are running bales. Exclusive of linters for the United States

capacity in 1927 to 95.5 per cent in 1928. The aggregate number of active spindle hours in 1928 decreased 5.4 per cent for the cotton-growing States and 22.3 per cent for New England. While raw-wool production in the United States for 1928 exceeded that of 1927 by 5.7 per cent, the reported wool consumption of mills decreased 2.5 per cent. Monthly deliveries of raw silk to the mills in 1928 averaged 47,584 bales, a gain of 4 per cent over 1927. Rayon-yarn production amounted to 97,900,000 pounds, a gain of almost 30 per cent over 1927. Production of hosiery in mills decreased and the number of men's and boys' garments cut also showed declines as compared with 1927. Comparative figures for a number of years will be found in Table II.

The broad group of manufacturing enterprises classified as the textile industries in the United States as divided by the Census Bureau fall into three subgroups—industries making or aiding in the manufacture of textile fabrics, those making wearing apparel from purchased fabrics, and those making other commodities from purchased fabrics. Industries in the second and third subgroups use as their principal materials the products of the first subgroup. Within a single industry, however, there is sometimes considerable duplication in value of products owing to a similar cause. The principal divisions of the first subgroup ranked according to value of products in 1927, are cotton manufactures, wool manufactures, knit goods, silk manufactures, and manufactures of vegetable fibres, other than cotton. The production of rayon mills is classified by the Bureau of the Census under the chemical schedule but in the present work is discussed under RAYON.

In all of these various groups there was great

Cotton Manufactures. Cotton goods, cotton small wares, and cotton lace goods form the principal branch of the American textile industry. Of these three, the manufacture of cotton goods naturally is by far the most important, as cotton small wares and lace goods form a comparatively small portion of the total output. The cotton-goods manufacturing industry embraces mills engaged in any of the preliminary

processes preparatory to spinning, in spinning, and in weaving piece goods over 12 inches in width. The finishing processes of bleaching, dyeing, and printing are carried on mainly in separate plants. Manufacturers of cotton knit goods are not considered a part of the cotton-goods industry, being classified in the "knit-goods" in-

tire, 178,807,302 square yards, \$43,555,624; towels, towelings, and wash cloths, 169,997,031 square yards, \$42,611,371; fabrics (other than shirtings) in chief value of cotton containing rayon, 163,824,938 square yards, \$41,644,800; drills, 347,775,666 square yards, \$40,668,249; shirtings, made entirely of cotton, 299,453,436

TABLE VI—THE COTTON-GOODS INDUSTRY

From *Commerce Year Book, 1929*

1927	1,347	467,596	2,358,830	380,909,543	871,591,901	1,567,400,612	695,808,711
Per cent change from 1925	-1.4	+5.0	+5.5	+7.6	-19.1	-8.6	+9.2

* The figures for years 1899 and 1909 are not strictly comparable with those for 1914 and later years, for the reason that the manufacture of cotton lace goods was included partly in the cotton goods and partly in the cotton small-wares branch of the industry at censuses prior to 1914.

^b Not called for in schedule for 1921.

dustry. The number of establishments, persons engaged, amount of wages, cost of material, value of the total product, and value added by manufacture are shown in Table VI.

The 1347 establishments engaged primarily in the manufacture of cotton goods in 1927, according to data collected at the biennial census of manufactures taken in 1928, reported products valued at \$1,567,400,612, a decrease of 8.6 per cent as compared with \$1,714,367,787 reported for 1925, the previous census year, and a decrease of 26.2 per cent as compared with \$2,125,272,193 for 1919, the maximum year.

The production for 1927 was as follows: Woven goods, over 12 inches in width, 8,980,414,774 square yards, valued at \$1,183,760,651; cotton yarns for sale, 664,334,562 pounds, \$253,663,750; thread, 29,992,472 pounds, \$46,409,250; cotton waste for sale, 484,416,320 pounds, \$26,808,651; other products, \$56,758,310. The leading items entering into the total for woven goods were the following: Sheetings, 1,857,476,174 square yards, valued at \$167,888,002, print cloth, 1,583,861,282 square yards, \$109,826,442; cord fabric for tires,

square yards, \$38,953,426; reps, poplins, and broadcloths, 264,724,549 square yards, \$37,655,931; gingham, 290,618,626 square yards, \$37,128,856, fabrics entirely or in chief value of rayon, 117,052,733 square yards, \$36,300,172; lawns, nainsooks, cambrics, and similar muslins, 272,453,611 square yards, \$32,100,888.

The 1347 establishments in the cotton industry reporting for 1927 were located in 30 States, as follows: 374 were located in North Carolina, 163 in Massachusetts, 164 in South Carolina, 139 in Georgia, 107 in Pennsylvania, 68 in Alabama, 66 in Rhode Island, 35 in Connecticut, 35 in New York, 26 in Texas, 25 in New Jersey, 21 in Tennessee, 17 in Maine, 17 in New Hampshire, 14 in Mississippi, 11 in Illinois, 11 in Virginia, 9 in Michigan, 8 in Maryland, 7 in Ohio, 5 in Wisconsin, 4 in California, 4 in Kentucky, 4 in Vermont, 3 in Arkansas, 3 in Indiana, 3 in Louisiana, 2 in Missouri, 2 in Oklahoma, and 1 in Delaware.

It will be observed that the industry is confined principally to New England and the cotton-growing States lying along the Atlantic seaboard.

TABLE VII—GEOGRAPHIC DISTRIBUTION OF COTTON-GOODS INDUSTRY IN THE UNITED STATES

Connecticut	48	42	35	15	12	13	61,067	52,100	49,178
Maine	16	16	17	14	12	10	46,702	41,188	34,414

179,740,778 square yards, \$66,974,970; napped fabrics, 400,097,211 square yards, \$55,386,356; twills and sateens, 413,996,565 square yards, \$50,336,045; denims, 254,117,955 square yards, \$49,791,845; plushes, velvets, and velveteens, 42,689,229 square yards, \$45,710,213; ounce duck except

Of the establishments reporting in 1927, 834 (61.9 per cent of the total) were located in the cotton-growing States, 302 (22.4 per cent) in New England, and 211 (15.7 per cent) in other States.

In 1925 the industry was represented by 1,366

establishments, the decrease to 1,347 being the net result of a loss of 121 establishments and a gain of 102. Of the 121 establishments lost, 66 went out of business prior to 1927, 29 reported commodities other than cotton goods as their principal products in 1927 and were therefore transferred to the appropriate industries, and 26 were idle throughout the year. Of the 102 establishments gained, 6 had manufactured other classes of commodities as their principal products in 1925 and 96 reported for the first time at the 1927 census.

Table VII shows a decreased number of mills in New England and "All other States," while the number in the South increased.

Of a total production in the cotton-goods industry valued at \$1,567,401,612 in 1927, the output of Southern mills accounted for 57.5 per cent, the production of New England mills for 33.1 per cent, and that of mills in other States for 9.4 per cent. The 1925 output was divided as follows. 54.2 per cent for the cotton-growing States, 35.5 per cent for New England, and 10.3 per cent for all other States.

In value of production, North Carolina superseded Massachusetts in 1927 for the first time in the history of the industry, the share of the former amounting to 19.8 per cent and of the latter to 18.2 per cent. In 1921 Massachusetts manufactured 24.6 per cent of the total output and North Carolina 14.9 per cent. Production in South Carolina, which in 1927 ranked third in importance in the cotton-goods industry, increased

in value from 1.5 per cent of the total in 1921 to 14.8 per cent in 1927, and the output of Georgia mills rose from 8.2 per cent in 1921 to 11.5 per cent in 1927.

Spindles. In 1927, the United States had approximately 22.2 per cent of the world's total of cotton spindles (see Table V on page 1552). The geographical distribution of the industry according to the number of spindles for the 10 leading States is shown in Table VII.

At the end of July, 1929 the total number of cotton spindles in the Southern States was 18,847,636, as compared with 13,478,297 in 1914. Southern cotton mills, with still less than half the spindles in America, however, were consuming considerably more than half the cotton manufactured in the country.

The increased spindleage and greater efficiency of cotton mills in the United States enabled that country as regards the consumption of cotton to maintain a higher level than in pre-war years, as compared with other nations where there was a great falling off in consumption, in the United Kingdom and continental Europe. Notwithstanding strikes in the New England cotton mills in 1922, the consumption of cotton increased over the previous year in the United States by 12.6 per cent and has continued since that time. In 1913 the United Kingdom in its manufactures used more than 4,600,000 bales and the Continent approximately 7,500,000 bales; in 1927 they took, respectively, 3,215,000 and 7,669,000 bales. Japan has increased its proportion of the world

total, while India has remained practically stationary. The actual and relative consumption of all kinds of cotton, in bales of 478 pounds net, by principal consuming countries of the world is shown in Table IV on page 1552.

Looms. In 1927 the approximate number of power looms in the world was 3,183,000. Of these, 786,309 (24.7 per cent) were in the United Kingdom; 760,132 (23.8 per cent) in the United States; 240,799 (7.6 per cent) in Japan (1924), 240,700 (7.6 per cent) in Germany; 182,500 (5.7 per cent) in France; 154,262 (4.7 per cent) in India; and, 139,000 (4.4 per cent) in Italy. The United States and the United Kingdom each had about an equal number, and each had more than three times as many as the nearest competitor. Both together had approximately half the power looms of the world, while the seven countries listed had about 80 per cent.

Wool and Wool Manufacturing. In 1927, as in previous years, Australia led the world as a producer of wool with 924,410,553 pounds, or over 26½ per cent of the total, while Argentina ranked second with 331,000,000 pounds, or about 9.22 per cent; and the United States third with 328,137,000 pounds, or 9.14 per cent of the world supply. After the production and importation of the wool comes the manufacture of the raw material—which includes scouring, carding, spinning, and weaving—into various kinds of cloth, such as worsted goods, woolen goods, carpets and rugs (other than rag), felt goods, and wool-felt hats.

Wool manufacturing according to the census of 1927 ranked second in the value of its product of the five primary textile groups. Raw wool was produced in all of the 48 States, but most of it came from the Middle Western and Far Western States, Texas with 32,725,000 pounds (35,591,000 pounds in 1928) leading, followed by Montana with 24,166,000 pounds (26,626,000 pounds in 1928), and Wyoming with 25,317,000 pounds (26,488,000 pounds in 1928). Wool manufacturing, on the other hand, centres in the New England and Middle Atlantic States. In 1928 there were in the United States 2,249,896 woolen and 2,544,193 worsted spindles, and 57,842 looms wider than 50 inches reed space, 14,866 less than 50 inches, and 9803 carpet and rug looms. See Tables IX and X.

The wool-manufactures group comprises five industries, of which worsted goods, woolen goods,

and carpets and rugs are the most important. Statistics of the Bureau of the Census show that the total value of wool manufactures produced in the United States during 1927 was \$1,036,143,000, a decrease of 14 per cent compared with 1925, and of 21 per cent from 1923, the highest year in the history of the industry. Establishments engaged primarily in manufacture of woolen and worsted goods reported products valued at \$818,000,000 in 1927, a decrease of 15 per cent compared with 1925.

TABLE IX—WOOLEN AND WORSTED SPINNING SPINDLES IN THE UNITED STATES

Year	Woolen		Worsted	
	Number reporting	Per cent idle	Number reporting	Per cent idle

* January only

Woolen Goods and Worsted Goods. The establishments engaged primarily in the manufacture of woolen goods and worsted goods in 1927 reported products valued at \$817,978,299, a decrease of 14.6 per cent as compared with \$957,790,338 reported for 1925, the preceding census year. The items making up the total for 1927 are as follows: Woven goods, 550,267,799 square yards, valued at \$571,327,437; yarns for sale, 145,727,627 pounds, \$183,429,969; miscellaneous products, valued at \$63,220,893. Of the total for woven goods, 284,856,657 square yards, valued at \$257,217,778, were produced in woolen mills, and 265,411,142 square yards, valued at \$314,109,659 in worsted mills. In addition, woolen goods and worsted goods are made to some extent by establishments engaged primarily in other lines of manufacture. The value of such products reported for 1925 was \$9,595,481. The woolen goods and worsted goods industries embrace establishments engaged primarily in the manufacture of woolen goods and of worsted goods, respectively. An establishment making both woolen goods and worsted goods is classified by the census as a whole, according to the value of its principal product.

Establishments which were engaged primarily in the manufacture of woolen and worsted goods in 1927, were to be found in 33 different States, but the bulk of the industry was located in the northeastern portion of the United States. Of

TABLE X—ACTIVITY OF WOOL MACHINERY

Source: Bureau of the Census

NOTE—The percentage of hourly activity represents the ratio of the hours actually run by machinery, taking account of double-shift, part-time, and overtime operation, to the total number of hours which would be possible if all machinery operated at the maximum single-shift capacity, the percentage of machinery active is based on monthly reports, any machine active at any time during the month being counted, and no account being taken of variations in the number of days or hours worked. There are small variations from month to month in the completeness of the reports which may slightly affect the accuracy of the percentages. The following statistics are based on reports from 1134 mills in 1923, 1084 in 1924, 1098 in 1925, 1104 in 1926, 1082 in 1927, and 1070 in 1928.

Year	Per cent of reporting machines active					Hours worked, per cent of maximum single-shift capacity

759 establishments whose production figures in the census, 174 were located in Massachusetts, 146 in Pennsylvania, 95 in Rhode Island, 59 in Maine, 40 in Connecticut, 39 in New Hampshire, 38 in New York, 24 in New Jersey, 18 in Wisconsin, 16 in Vermont, 12 in Ohio, 11 in Minnesota, 9 in Tennessee, 8 in Michigan, 8 in West Virginia, 7 in Oregon, 7 in Virginia, 6 in Indiana, 6 in Kentucky, 6 in North Carolina, 5 in California, 5 in Illinois, 4 in Georgia, 4 in Maryland, and the remaining 12 in 9 other States. In 1925 the industry was represented by 832 establishments, the decrease to 759 in 1927 being the net result of losses and gains. Of the establishments lost, some were idle throughout the year, some went out of business prior to 1927, some reported commodities other than woolen goods and worsted goods as their chief products and were therefore transferred to the appropriate industries, and some reported products valued at less than \$5,000 which are not tabulated at the biennial censuses.

Silk-manufacturing Industry. The silk manufacturing industry of the United States not only surpasses that of any other country of the world, but in the value of its production comes immediately after cotton and wool as is indicated in the accompanying table (Table I) at the beginning of this article. The silk industry is discussed elsewhere at more length (See *SILK*), but a few significant facts may be given here in connection with the other textile manufactures in the present article. The United States does not produce raw silk, but receives its supply principally from Japan, the imports in 1928 being valued at \$368,000,000, or an average import value per pound of \$4.87. The amount represented in the 1928 imports was 75,500,000 pounds, which made a new record. Raw silk is the leading import of the United States. The growth of the industry has been most striking since 1914 when the production was valued at \$254,011,000, a figure that by 1927 had reached \$750,124,000. Paterson, N. J., the largest centre of the industry, in 1927 was responsible for a production valued at \$106,000,000.

Rayon Industry. Few industries had developed more rapidly and enjoyed a more spectacular growth than that of rayon and particularly in the United States. The development of this industry has presented many features of interest

which are discussed in the article *RAYON*, but in the present connection some of the more significant features may be stated for comparison. In 1914 yarns and sheets (excluding fabrics) produced in the United States amounted to 2,445,000 pounds. In 1928 this production had increased to 97,901,000 pounds. In the previous year, 1927, the value of rayon products was estimated by the Census of Manufactures at \$109,888,000, as compared with \$88,061,000 in 1925. Rayon not only was used alone in the manufacture of fabrics, but with cotton and wool both for fabrics and various knit goods, such as hosiery.

Miscellaneous Textiles. The United States is forced to depend on its imports for various vegetable fibres which it uses in manufactures. The most important of these are jute, manila fibre, together with sisal and henequen. These fibres figure in the manufacture of cordage and twine, as well as jute, bagging, linen, and part-linen woven goods, and other products. The cordage and twine industry in 1927 had a product valued at \$89,172,495 coming from 116 establishments with 15,084 wage earners, who received wages valued at \$13,674,081. In 1914, 105 establishments gave employment to 16,769 wage earners, who received in wages \$6,995,596 and produced goods valued at \$59,761,486. 1919 was a record year in the industry with an output valued at \$133,366,476, followed by 1923 with \$100,447,564. Binder twine is the most important individual item in this industry and in 1927 amounted to 169,800,000 pounds worth \$19,500,000. Rope, cable, and cordage followed binder twine in the order given.

Jute goods and linen goods showed a decline in 1927, as compared with 1925, the output of manufactures of jute amounting to \$23,200,000 in 1927, while that of linen goods was valued at \$10,400,000. Burlaps imported in 1928 increased to 620,000,000 pounds, as compared with 569,700,000 pounds during 1927, and the importations of jute bags or sacks increased from 38,800,000 pounds in 1927 to 42,200,000 pounds in 1928.

Knit Goods. Under this head, as is apparent from the accompanying tables, there has been developed an important industry. The classification is used to include the output of all establishments whose principal products are made by machine knitting without regard to whether the

• Each industry is classified according to its products or principal value. ^b Not available.^c Not including custom-made clothing. Figures for 1925 and 1927 exclude work clothing, men's.^d Included in "Clothing, men's, not elsewhere specified" prior to 1925.^e Not elsewhere classified "Gloves and mittens, cloth," included with men's furnishing goods for 1914.^f Because of a change in classification, no comparable figures can be given for 1914. Figures exclude elastic surgical goods.^g Not including gloves made in textile mills. This item was under men's furnishings in 1914.^h Not elsewhere classified. Custom-tailoring shops are not included, no matter how large.ⁱ "Handkerchiefs" and "Trimmings" were first treated as separate industries at the census for 1927. For prior censuses data for "Handkerchiefs" were included in part in "Furnishing goods men's" and in part in "Millinery and lace goods," and data for "Trimmings" were included in "Millinery and lace goods."^j Because of changes in classification whereby women's and children's straw hats were transferred to this industry and lace goods excluded, no comparable figures can be given for previous years. The production of untrimmed hats is covered, in part, by other industry classifications, namely, "Hats, fur-felt," "Hats, wool-felt," and "Hats and caps, cloth."^k Because of a change in classification, excluding women's and children's hats, no comparable figures can be given for previous years. ^l Not included in total at top of table.

yarns used are cotton, wool, silk, rayon, or other material. Beginning with the census of manufactures for 1923, the industry has been divided into four branches, namely, hosiery, underwear, outerwear, and knit cloth. Each establishment the output of which figures in the statistics as a whole was assigned to one branch or another, according to the character of its products. Some overlapping occurs among these branches, and most of the establishments manufacture some minor products not normally belonging to the industry.

In 1927 the total value of production in the knit-goods industry as a whole amounted to \$816,620,494, an increase of about 1 per cent compared with 1925 and slightly more than three times the value of the 1914 output, but a decline of 4 per cent from the high record of the industry attained in 1923. Hosiery is the only branch of the knit-goods industry in which the value of the output in 1927 exceeded that of 1923. Production in the hosiery branch was valued at \$456,913,137 in 1927, an increase of 8.5 per cent over 1925 and of 17 per cent over 1923. The output of the knit-underwear industry in 1927 was 8 per cent less than in 1925 and 5 per cent below 1923. In the outerwear branch, 1927 production fell 12 per cent below that of 1925 and almost 40 per cent below 1923. The value of the output in the knit-cloth branch in 1927 increased 6 per cent over 1925, but declined 10 per cent compared with 1923.

Wearing Apparel. In 1927, according to the census of manufacturers, the United States had 16,259 establishments employing 511,151 wage earners engaged in the production of all classes of textile wearing apparel (other than knit goods, fur-felt hats, wool-felt hats, straw hats, and fur goods), compared with 14,883 establishments and 466,846 wage earners in 1925. These establishments reported a production valued at \$3,456,304,000 in 1927, an increase of 6.5 per cent. The cost of the materials used in manufacture declined from 54 per cent of the total value of the finished output in 1925 to 52 per cent in 1927. There is some duplication in this total value due to contract work on material furnished by other establishments. The most important branch of the textile wearing-apparel industry, from the standpoint of value of production is "women's clothing" which in 1927 reported an output valued at \$1,494,401,000, an increase of 15 per cent over 1925. The women's-clothing industry is concentrated to a large extent in 8 cities—New York, Chicago, Philadelphia, Cleveland, Boston, St. Louis, Los Angeles, and Baltimore, which together produced 91 per cent of the total production under this head. See Table XII on page 1557.

Clothing Industry. The manufacturers of men's, youths' and boys' clothing (except work clothing), the second largest branch of the wearing apparel industry, reported a production valued at \$932,182,000 in 1927, a decrease of 1.5 per cent from 1925. This industry is concentrated to a large extent in 10 cities—New York, Chicago, Philadelphia, Rochester, Baltimore, Cincinnati, Boston, Cleveland, St. Louis, and Milwaukee. These cities for 1927 reported 83 per cent of the total value of products for the industry.

In both the men's and women's clothing branches, there is a considerable amount of contract work. In 1927 establishments in the women's clothing industry paid \$147,902,000 for contract work, while establishments producing

men's, youths', and boys' clothing paid \$94,388,000.

According to the census, the value of production in 1927 showed increases over 1925 in other wearing apparel industries as follows: Men's furnishing goods; fur-felt hats; shirts; men's work clothing, except shirts; wool-felt hats; gloves and mittens made of cloth and of cloth and leather combined; and corsets and allied garments. The output of the men's straw hat and the millinery industries for 1927 apparently showed a decrease in the value of output. The production of the men's collar industry decreased 52 per cent from 1925 and the output of cloth hats and caps, and of suspenders, garters, and elastic woven goods also declined slightly.

There are available data on wearing apparel (not knit) for 1928 in the form of the monthly statistics of garments cut. Reports of 730 identical establishments manufacturing men's and boys' garments to the Census Bureau indicated that the total number of suits cut in 1928, 22,564,000, decreased 7.1 per cent from 24,241,000 in 1927, while the number of overcoats cut, 5,147,000 in 1928, declined 7.7 per cent from 5,579,000 in 1927. The number of separate trousers cut by these establishments totaled 21,800,000, 11.7 per cent less than in 1927.

The Census Bureau also reported that 264 establishments in 1927 produced 72.5 per cent of the total output of the men's-work-clothing industry. In 1928 these establishments reported the following garments cut: Men's and boys' overalls, 48,100,000; children's play suits, overalls, etc., 3,500,000; work pants and breeches, 13,800,000; coats and all other garments, 1,680,000.

See COTTON; RAYON; SILK; and WOOL.

THARAUD, ta'ró', JEAN (1877-) and **JÉRÔME (1874-)**. French brothers who wrote novels in collaboration (see VOL. XXII). They were awarded the Grand Prix de Littérature of the French Academy in 1919. Their later works include *La vie et la mort de Déroulède* (1914); *L'Ombre de la Croix* (1917); *Rabat; ou Les heures Marocaines* (1918); *Un Royaume de Dieu* (1920); *Marrakech* (1920); *Quand Israël est roi*, a history of Hungary from 1867 (1921); *La Randonnée de Samba Diouf* (1922); *L'An prochain à Jérusalem* (1924); *Rendez-vous espagnols* (1925); *Un drame de l'automne*, sketches. *Notre cher Péguy* (1926); and *Mes années chez Barrès* (1928). Many of these books were translated into English. Consult *Le roman nouveau*, by Jules Bertaut (1920) and *Le victorieux XX^e Siècle*, by Pierre Moreau (1925).

THEATRE, AMERICAN AND ENGLISH. The World War served neither to unsettle nor greatly to affect the American theatre during the early months of its progress in 1914; but it served rather to feed the theatre emotionally and to demand nothing of it in return. America, having settled upon a determined neutrality, openly endorsed by all business that might be affected by any different policy, was outwardly taking the War in its stride. The business of the theatre throughout the country proceeded with its accustomed casualness.

The times were, however, ripe for change. For too many years, with an amiability characteristic of a satisfied people, American playgoers had accepted what had been provided for them in the way of theatre entertainment without protest. The murmurings of a revolt against an accepted routine, however, were already beginning to be heard. There was a definite hunger for novelty;

also a recurring questioning as to why the Continental theatre should have been permitted so completely to take the leadership of the theatre in the matter of successful and interesting experiment.

A fluttering straw in the wind, giving indications that changes were imminent, was the early production of a melodrama, *On Trial*. This piece, written by Elmer Reizenstein (now Rice), violated most of the rules of dramaturgy that had been handed down variously from the days of Aristotle. Its author, encouraged by Arthur Hopkins, the producer, had dared adopt what was becoming familiarly known in the manufacture of the motion picture (then, as now, admitted struggling through the days of its infancy as an art), as the "flash-" or "cut-back" feature. By its use, a dramatic story could literally be told backward.

Thus, in *On Trial*, a man who had confessed the crime of murder was being forced through a perfunctory examination, which should give the State the proper legal excuse for hanging him. As the first witness called by the defense took the stand and began her testimony, the scene was "blacked out" and the testimony enacted. For each change of witnesses, a return to the courtroom was made, and the trial resumed. When the end of the play was reached, the motivating cause of the murder, occurring years before, had been revealed, sufficient justification for the crime to satisfy the jury had been adduced, and the expected happy ending made possible. As the production of *On Trial* was financially a complete success, a convincing argument against a slavish adherence to any particular form of drama had been given producers, and a certain freedom of movement, at least, had been established in the theatre.

This same season, too, a definite step forward was taken in the matter of establishing a new standard of beauty in stage settings. This, too, was directly traceable to the world conflict, being the creation of Joseph Urban, a War refugee, who had been the scenic designer for the Burg Theatre in Vienna. Landing in America, Urban had become, after some struggle, the artistic director of the Boston Opera House, and made tentative advances in the direction of New York. He was one of a school that plead for imagination and simplicity, as opposed to an attempted realism in scenic design. He was a modern who stopped this side of impressionism, yet advanced far enough to bring a freshened beauty to a fading type of stage picture.

George C. Tyler, as executive head of Liebler & Co., a play-producing firm that had known great prosperity but had fallen upon trying days, had this season risked practically all his firm's diminishing capital on a single production. This was Edward Sheldon's *The Garden of Paradise*, based on the Hans Christian Andersen fairy story, *The Little Mermaid*. Urban was engaged to do the setting, and, this being his introduction to theatrical New York, he gave his best efforts to it. The result was beautifully effective, but the play failed and carried Liebler & Co. to the bankruptcy court in its train. Florenz Ziegfeld, having achieved a mounting reputation at the time for the attractiveness of his annual *Follies* exhibits, bought the settings Urban had made for *The Garden of Paradise*. He used some of them to decorate a roof theatre in which he introduced the *Midnight Frolic*. Others were put into the current *Follies*. More important, Mr.

Ziegfeld signed a term contract with Mr. Urban, which gave this artist not only a New York footing, but a prestige upon which he has builded steadily ever since. The Urban influence, antedating that of Leon Bakst and the Diaghliev ballet, has played a definite and significant part in redecorating the stages of the American theatre.

Other War influences followed more rapidly; as the conflict continued. Granville Barker and Lillah McCarthy, leaders of a divisional part of the London theatre, brought their company to New York in late January, 1915, and began with productions of Shaw's *Androcles and the Lion* and *The Man Who Married a Dumb Wife*, by Anatole France, a season which included also Mr. Barker's excessively modern revival of *A Midsummer Night's Dream* (with golden fairies), and a revival of Shaw's *The Doctor's Dilemma*. Emanuel Reicher arrived from Berlin and, despite a lessening interest in neutrality, managed several revivals, notably one of Hauptman's *The Weavers*, that were measurably inspirational.

A year later, the importation of the Diaghliev Ballet Russe, with its impressive corps and its excessively brilliant color schemes, created by Leon Bakst, introduced another startling note in the native theatre. Sir Beerbohm Tree also was forced into a foreign tour that year, presenting a notable revival of *Henry VIII*, and doing several festival performances of Shakespearean excerpts.

Meantime, the New York theatre continued a generally dull routine. It was in 1916, however, that an organization known as the Washington Square Players was born. Amateur in makeup, this organization established a vogue for original productions of one-act plays in an obscurely placed theatre known as the Bandbox. The group later moved into the centre of theatrical activity, but failed when America entered the War and took most of its young men.

Three years later, on the occasion of this band's reorganization, the beginnings of the present Theatre Guild were established. By 1929 the Theatre Guild had received the support of 30,000 subscribers and tenanted its own theatre, built at a cost of \$750,000, by popular subscription. It also holds temporary leases on several other theatres, to which a continuing Guild success is transferred when the home theatre is needed for other productions.

A growing apprehension concerning the European conflict, the developing camps of neutrals and allies, served to divert attention from the theatre in 1915-16. Little that was worthy was written or produced. The older stars fell back on revivals, the veteran William Gillette emerging from an inactive past to bring back *Sherlock Holmes* and *Secret Service*, E. H. Sothern going back as far as his father's *Lord Dundreary*. James K. Hackett and Viola Allen revived *Macbeth*, and both the Fiskes and Sir Beerbohm Tree did *The Merry Wives of Windsor*. The late Tom Wise was the Falstaff of the Fiske revival, and Henrietta Crossman the Mistress Ford.

The next two seasons in the theatre were hectic with the excitements of War. Soldier shows, benefits, war dramas dominated and colored the scene. Still, so far removed was America from direct contact with the scene of action that something of the normal routine of the theatre was maintained. It was the season of 1916-17 that welcomed avidly such obvious pieces of the theatre as *Turn to the Right* and *The Thirteenth*

Chair. This, too, was the season that brought Lionel Barrymore back to the stage in association with his brother John. With Constance Collier, the Barrymores produced Du Maurier's *Peter Ibbetson* with considerable success.

Sarah Bernhardt, forced again to replenish the funds with which she had hoped to end her days in comparative peace and plenty, came to America for a short tour with a series of one-act plays, including *La Mort de Cléopâtre*, *L'Holocauste*, *Du Théâtre du Champ D'Honneur*, and *Hécube*. Sir Beerbohm Tree extended his stay through a revival of the Thackeray adaptation, *Colonel Newcome*.

A troupe of Spanish dancers, having stirred Havana, came to New York in a hastily organized revue, *The Land of Joy*, and thus contact was preserved with America's inactive, as well as active, allies. Red Cross benefits were logically a distinguishing feature of the time. Organizing an all-star company to present the Hartley Manners war drama, *Out There*, in which Laurette Taylor had played successfully, George C. Tyler took the aggregation as far west as Chicago and added approximately \$750,000 to the war chest of this national charity.

America's comparatively short participation in the War had developed an interest in war plays, but had given playwrights but little time to foster it. The close of the conflict found the stage cluttered with dramas of military conflict and influence of various kinds, and a diminishing interest in war plays on the part of the celebrant public. A natural reaction toward the cheerful and imaginative drama favored the success of a piece called *Lightnin'*, which the late Frank Bacon played for the succeeding five years; a production of Barrie's *Dear Brutus*, with William Gillette the star of the cast; a Winthrop Ames production of Maeterlinck's *The Betrothal*, and an elaborate staging of *The Redemption*, with John Barrymore as its star.

A year later, the actors, reflecting the temper of the times, had started a small war of their own. This was the actors' strike of 1919-20 which, conducted by the Actors' Equity Association, continued for a period of five weeks and was finally settled by arbitration. By the terms of settlement, the actors gained salary adjustments granting them pay for rehearsals after a certain period, pay for extra performances during the run of the play, full pay for such periods as Holy Week and the week before Christmas if they were asked to play, and other minor concessions. The managers also were given certain contract guarantees by Equity and the result of the strike was spoken of as a peace without victory. The actors, however, did most of the smiling.

Significant dramas produced after the ending of the actors' strike included the Arthur Hopkins production of Sam Benelli's *The Jest*, with John Barrymore establishing more firmly his ranking position as the outstanding male star of the American stage; the importation of John Drinkwater's *Abraham Lincoln*, Ethel Barrymore's success with Zoe Akin's *Déclassé*, the production of Eugene O'Neill's first full-length play, *Beyond the Horizon*, and the most successful of the post-war plays, James Forbes' *The Famous Mrs. Fair*.

The trend and content of one theatre season differ but little from those of another. The approach toward, and the retreat from, the boldnesses of the Restoration drama, for example, were subject to the influences of many theatre

seasons. Similarly, there was a certain defiance of spirit, a certain demand for freedom of expression, in the drama born of post-war influences, which was eventually to be felt in the theatre; but, through the years from 1920-21, to those of 1923-24, its development was by suggestion rather than statement. It was in 1920-21 that Eugene O'Neill's *Emperor Jones* called renewed attention to his interest in new dramatic forms, but a year later, he swung back to *Anna Christie*, which, aside from a certain frankness of theme, ran true to the traditional melodramatic structure. Arthur Hopkins ventured to test the progressive temper of the times by doing a somewhat fantastically abstract production of *Macbeth*, with a setting by Robert Edmond Jones, and with Lionel Barrymore in the leading rôle. It proved a quick, and, in several respects, a healthy failure. The same season, David Belasco, in the cause of the older theatre, tossed a fortune away with a handsomely staged but artistically frail production of Sacha Guitry's *Deburau*.

There was progress noted in Owen Davis's *The Detour*, much the best study of character the master of melodrama had written; in Gilbert Emery's searching study of misleading character values in a post-war piece called *The Hero*; in Arthur Richman's study of the domestic middle-class struggle in New Jersey called *Ambush*, and in O'Neill's further venture into fantasy that should sting and satirize with *The Hairy Ape*.

A year later, the Theatre Guild had advanced to such a position of financial stability that it felt safe in producing Georg Kaiser's *From Morn to Midnight*, thus strengthening the faith of its following in certain asserted virtues of the Continental theatre and encouraging the more progressive of its (the Guild's) would-be imitators. Mr. Davis followed *The Detour*, a popular failure, with *Icebound*, a moderately popular success which won him a Pulitzer Prize; and Morris Gest, aided by the support and sympathy of art's generous patron, Otto Kahn, imported the famed Moscow Art Theatre from Russia.

Belief in a possible renaissance of the native theatre was considerably stimulated by these events. The new theatre, its adherents insisted, should be a theatre that should be emancipated in matters of traditional romance and sentiment, and revitalized by scenic settings that should strive to excite the imagination in place of merely satisfying the eye or arousing primitive admiration for realistic reproduction. The perfected ensemble work of the Russians became the text of many critical sermons.

Meantime, the old theatre was represented by the hugely popular success of John Colton and Clemence Randolph's *Rain*, in which Jeanne Eagels played for four successive years, John Barrymore's successful début as Shakespeare's *Hamlet*, and John Galsworthy's sanely balanced argument in a racial drama called *Loyalties*.

Mr. Gest continued his ministrations to the artistic soul of the drama in America by importing, again with Mr. Kahn's aid, the Max Reinhardt production of *The Miracle*, which transformed the one-time New Theatre (renamed the Century) into the cathedral-like home of a dramatic sensation at a cost of \$400,000, a sum, incidentally, later recovered when *The Miracle* was given certain festival revivals in other American cities.

The advancing newcomers were represented in the theatre the same season by the arrival of Maxwell Anderson with *White Desert*, a rather

distinguished failure, and George Kelly with *The Show-off*, a rousing popular comedy success. A number of drama critics, in fact, insisted *The Show-off* should have been given the Pulitzer award in place of *Hell-bent-for-Heaven*. Hatcher Hughes' drama of religious bigotry in the South, which was that year the main committee's selection.

The most definite success won by the emancipators of the drama from the traditional conventions came in the season of 1924-25, when the Laurence Stallings and Maxwell Anderson *What Price Glory?* blasted the old-time war play of romantic heroics out of the theatre and established a new record in the free employment of soldiers' oaths spoken in mixed company. The strike for freedom was further stimulated by the success of Sidney Howard's *They Knew What They Wanted*, which was given the Pulitzer award and which also carried the cause of an embarrassing but true speech a little farther. The failure of Charles Dillingham to convince the play-going public that it should be interested in the performances of Marilyn Miller as Barrie's deathless *Peter Pan*, was another straw fluttering in the winds of the time, and the interest in a highly modernistic and slightly fantastic drama, *Processional*, written by John Howard Lawson, and produced by the Theatre Guild, was another. *Peter* died peacefully (the memory of Maude Adams still lived), and *Processional* lingered interestingly, though not for long.

The Stallings-Anderson success with *What Price Glory?* inspired the same two to write, and Mr. Hopkins to produce, two other dramas of historic background—one, *First Flight*, relating an experience of the younger Andrew Jackson, and the other, *The Buccaneer*, which followed bold Capt. Harry Morgan through an adventure having to do with the sacking of Panama City. Unfortunately for the successful continuance of the collaboration, neither of these plays proved a success.

Mr. O'Neill continued his experiments and his development as a strongly individualized dramatist by adding *The Fountain* and *The Great God Brown* to his output; George Kelly followed *The Show-off* with a serious drama about an unlovely woman called *Craig's Wife* (the Pulitzer winner); Horace Liveright adventured with a modern-dress production of *Hamlet*, in which Basil Sidney played the prince; and Eva Le Gallienne, realizing an ambition to do things independently in the theatre, established the beginnings of what has since become the Civic Repertory Theatre with revivals of Ibsen's *John Gabriel Borkman* and *The Master Builder*.

By the season of 1926-27, the demand for a revolution of sorts in theatre entertainment had changed to considerable extent the general character of the plays produced, and had emboldened authors to speak their minds and their sex themes plainly; but there was also a leaven of common sense and common taste that held the theatre pretty close to its older levels. Two of the outstanding successes of this year were the Philip Dunning-George Abbott night-club melodrama, *Broadway*, and Maurine Watkins's satire of Chicago criminal courts called *Chicago*. Dreiser's *The American Tragedy*, dramatized by Philip Kearney; Maxwell Anderson's *Saturday's Children*, Robert Emmet Sherwood's humanized historical satire, *The Road to Rome*, also were beloved of the people. Miss Le Gallienne found a success in Sierra's *The Cradle Song* just in

time to save her Civic Repertory Theatre, and Walter Hampden produced an Arthur Goodrich-Rose Palmer version of Browning's *The Ring and the Book*, under the title of *Caponssacht*, with great satisfaction to both himself and his following.

At the same time, the police of New York City saw fit to raid a Bourget-Hornblow version of *The Captive*, together with two other offending dramas; and an oil millionaire named Davis not only paid for many hundreds of performances of a play called *The Ladder*, but gave his show free to the public the greater part of the time. It was not a bad play, but the houses continued empty.

Nor did the season following bring further satisfaction to the defenders of the progressive order. Only the production of O'Neill's *Strange Interlude* violated the older routine of the theatre. This play, revolutionary in thought and form, proved amazingly successful. Mr. Gest, still active in the cause of the Continental progressives, brought Max Reinhardt back with a majority of that famous director's German actors, and again at the Century staged the German version of Shakespeare's *Midsummer Night's Dream*, *Danton's Tod*, and *Jedermann*, following later with intimate character studies in which Alexander Moissi was featured.

The Theatre Guild also won success with an all-Negro drama, a dramatization by Du Bose Heyward and Mrs. Heyward of the former's novel, *Porgy*, but the more popular successes of the year included those of *Burlesque*, a back-stage melodrama of the cheaper theatres; *Coquette*, a touching domestic tragedy of the South; *The Trial of Mary Dugan*, the courtroom adventures of a *Follies* girl, following the violent death of her paramour, made novel by the treatment of its courtroom setting, and various musical comedies extravagantly staged by Florenz Ziegfeld, including *Show Boat*, *Rosalie*, and *The Three Musketeers*.

The fact that the new theatre, with all its boasted freedom, now offered quite as little satisfying fare as it had offered before, turned the attention of those who had reduced the production of plays to a purely commercial basis toward the onrushing "talkie." The phonograph had been successfully synchronized with the animated screen drama and the novelty was proving a highly profitable combination. The last months of 1928 reverberated with predictions that the legitimate theatre was doomed, that a new type of entertainment was in process of creation, and that the spoken drama was gradually to be eliminated.

Those who held to the conviction that so long as the human urge was for human contact the legitimate drama would endure answered the "talkie" visionaries with a spirit that lacked nothing in earnestness but a little something in confidence. So many amazing things had happened in a startled world that prophets were content to remain unhonored even in their own countries.

So far as the English theatre is concerned, the War naturally settled with depressing suddenness upon all the serious activities in 1914, calling a halt to such promising movements as that of the repertory theatre and to the project of a national theatre as a Shakespeare memorial in London.

"Exceptions to this rule of doldrums," as has been pointed out in an earlier edition of this

SUPPLEMENT, "were the rebirth, after discouraging struggle, of the Stratford-on-Avon Players, under the sponsorship of Archibald Flower and other Stratford citizens, and the guidance of W. Bridges-Adams, the president, and scarcely appreciated efforts of the Everyman Theatre in Hampstead, and of the Old Vic south of the Thames in London; and the continuation of the Birmingham Repertory Theatre, sole survivor of the promising provincial movement that included Manchester, Liverpool, and Glasgow before the War. For the most part, however, the chief concern of these theatres was the revival of classic plays.

"Among British playwrights, likewise, the ten-year period was discouragingly fruitless. Bernard Shaw alone preserved the reputation of the group, for, without counting short sketches, he added to his canon such major works as *Heartbreak House*, pungent and bitter commentary on the futility of the War; *Back to Methuselah*, mastodontic summary of human civilization in five parts; and *Saint Joan*, ripest flower of his incisive intellect and imagination. John Galsworthy comes second, with *The Skin Game* and *Loyalities* as his most notable contributions to the depiction of contemporary human psychology on the stage. Of the elder figures, Barrie wrought with his old skill in *The Legend of Leonora* and *Dear Brutus* and less successfully in *Mary Rose*, while Pinero's *The Enchanted Cottage* is almost the sole faint reminder of the position he held through the decades that bounded the turn of the century. No playwright of the first order emerged from among the younger generation unless it be Clemence Dane, whose *A Bill of Divorcement* was not matched by her later *Will Shakespeare*. On the Irish side, Lennox Robinson alone fulfilled the promise of his early days when the Abbey Theatre, with Synge as its most priceless treasure, was holding out hope of a renaissance of English drama. Robinson's output was meagre, but *The Lost Leader* and *The White-Headed Boy* indicated that more would still be heard from him."

The season of 1923-24, however, developed something of a rebirth of interest in the better drama. It was, for one thing, a great year for the veteran stimulator, George Bernard Shaw. His *Saint Joan* had a long and most prosperous run, and even the unwieldy *Back to Methuselah* was not only successfully given at the Court Theatre, but two sections of this five-part play were later revived. Two theatres had Shaw repertory seasons, and those stage societies frequently organized to circumvent the British censor of plays, as well as to experiment and encourage the newer drama, were notably active.

Popular approval was given E. Temple Thurston's *Judas Iscariot*, two Frederick Lonsdale dramas, *The Fake* and *Spring Cleaning*, Noel Coward's unpleasant but exciting *Vortex*, and John Galsworthy's *Old English*. There were the usual unsuccessful attempts to create an interest in American comedies, Owen Davis's *The Nervous Wreck*, George Kelly's *The Show-off*, and W. A. McGuire's *Six-Cylinder Love* suffering comparatively quick failures.

"It must be said that a large portion of the hundreds of new plays brought out seemed hardly worth the pains and money lavished upon them," wrote Louis Henry Jacobson of the season following; "and also that some of them went far past the limit of what the gentle Shaw has cooingly called unpleasant." The dearth of worth-while

drama by English writers gave impetus to the success of several American experiments. These included two of Lulu Vollmer's character studies of the South, *Sun-up* and *The Shame Woman*, the former achieving an extended run; the Frank Bacon-Winchell Smith *Lightnin'*, the Colton-Randolph *Rain*, and O'Neill's *Emperor Jones*. Of native productions, Sean O'Casey's *Juno and the Paycock* came in for greatest praise. Lonsdale's *The Last of Mrs. Cheyney* was popular, also Ashley Duke's *Man With a Load of Mischief*, and Michael Arlen's *Green Hat*. American musical comedies also had a new popularity with the importation of *Rose-Marie* and *No, No Nanette*, and the Charlot revues were a topical rage.

There has been, during these later years, a marked increase in both the activities of the Little Theatres and the interest in community drama in Britain, thanks to the encouragement of the British Drama League. On two occasions, the British Little Theatres have sent contestants to the American Little Theatre Tournament and in each instance carried away prizes.

Galsworthy's success with *Escape* and Clemence Dane's *Granite* were properly appreciated; *Berkley Square*, extracted from the Henry James story by James Baldeiston and J. C. Squire, and Margaret Kennedy's *The Constant Nymph* were popular. The American invasion continued with Craven's *The First Year*, Avery Hopwood's *The Gold Diggers* and *The Best People*, and the Gleason-Taber *Is Zat So?*, *Lady Be Good*, with the Astaires, *Sunny*, and a colored troupe singing *Blackbirds* and featuring the late Florence Mills, amused London playgoers briefly and irritated English critics generally.

The drama of sex themes has played a part in recent London seasons as it has in those of New York. Plays have been classified as shocking by reviewers and patronized as exciting by a new breed of sensation-seekers. These have included Hopwood's adaptation, *The Garden of Eden*, Miles Malleon's *The Fanatics*, Simon Gantillon's *Maya*, Edouard Bourdet's *La Prisonnière*, and Edgar Middleton's *Potaphar's Wife*. Sidney Howard's *The Silver Cord*, and the Jewish *The Dybbuk* were accepted as impressive drama in London and there was a revived interest in the plays of Strindberg. *Broadway* has been a recent American success, and the Dreiser-Kearney *An American Tragedy* was briefly noticed. Later comedies have included Lonsdale's *The High Road*, Arnold Bennett's *Mr. Prohack*, and the Allen Harper-F. R. Pryor *Margold*.

IMPORTANT PRODUCTIONS ON THE AMERICAN STAGE, 1914-28¹

Season of 1914-15 *On Trial*, by Elmer L. Reizenstein (now Rice), produced at the Candler Theatre (now the Sam H. Harris), New York, Aug. 19, 1914, by Arthur Hopkins and Cohan and Harris, *The Phantom Rival*, by Franz Molnar, produced at the Belasco Theatre, New York, Oct. 6, 1914, by David Belasco, with Leo Ditrichstein, *Pugmation*, by George Bernard Shaw, produced at the Liberty Theatre, New York, Oct. 12, 1914, by Liebler and Company, with Mrs. Patrick Campbell, *The Show Shop*, by James Forbes, produced at the Hudson Theatre, New York, Dec. 31, 1914, by Selwyn and Company, with Douglas Fairbanks and George Sidney, *Children of Earth*, by Alice Brown, produced at the Booth Theatre, New York, Jan. 12, 1915, by Winthrop Ames, with Herbert Kelcey and Effie Shannon; *Marie-Odile*, by Edward Knoblauch (now Knoblock), produced at the Belasco Theatre, New York, Jan. 26, 1915, by David Belasco, with Frances Starr; *Androcles and the Lion*, by George Bernard Shaw, produced at Wallack's Theatre, New York, Jan. 27, 1915, by Granville Barker, with O. P. Heggie—

¹ The plays from 1914-24 are summarized from *Our American Theatre*, by Oliver M. Saylor, with the permission of the publisher, Brentano.

THE HAGUE, NETHERLANDS. See HAGUE, THE.

THELEN, MAX (1880-). An American lawyer, born at Rising City, Nebr., and educated in law at the University of California. In 1904 he began the practice of law in San Francisco. He was for many years counsel for several railroads and for the California State Railroad Commission, of which he was a member from 1912 to 1918 (president, 1915-18). During the period of the World War and after, he filled many important positions on advisory boards, on matters relating to railroads, and was Director of Public Service for the United States Railroad Administration in 1919-20. He was the author of *Leading Railroad and Public Service Commissions* (1912).

THEOSOPHICAL SOCIETY. A society founded in New York City in 1875, by Mme. Helen P. Blavatsky, assisted by Col. Henry S. Olcott, William Q. Judge, and others. The international headquarters were removed in 1879 to Adyan in India, near Madras, where the Society owns a tract of three hundred acres on the Adyar River, with numerous buildings, including a library, printing plant, business offices, auditorium,

and residences. The objects of the society, in general, are to study all matters relating to theosophy, to encourage the study of comparative religion, philosophy, and science, and to furnish information in regard to theosophy. During 1926 the international president, Dr Annie Besant, visited the United States, bringing with her a young Hindu, J. Krishnamurti, whom she claimed to be the chosen vehicle through which the "Messiah" or World Teacher would speak when He should come again. In 1926 the society had over 10,000 members, of whom 8582 were active, and in 1928 there were 257 local lodges in the United States. In 1927 the headquarters of the American Theosophical Society were moved from Chicago, to Wheaton, Ill. The president in 1928 was L. W. Rogers.

THEUNIS, GEORGES (1873-). A Belgian Senator and former Premier who began his career in the army, but soon tired of garrison duty and left it for the stock exchange of Brussels. He reentered the army in 1914 with the rank of colonel and was appointed by the Government to buy war supplies in England. At the Armistice, he was appointed Belgian High Commissioner in London and later Belgian delegate in the settlement of the financial and economic questions arising out of the indemnity conferences. In 1920 he was made Finance Minister, and at the end of 1921 Premier, but he did not enter Parliament. The Flemish disaffection and the rift between France and England made this a difficult period, but he sided with France and sent Belgian troops into the Ruhr. In 1924 he attended the Reparation Commission's conference in London and took part in the Dawes Report deliberations. After the March elections of 1925, Theunis resigned and in August, 1925, he headed the delegation which came to the United States to settle the terms of the Belgian war debt. Later, he became a senator.

THÉVENIN, DENIS. See DUHAMEL, GEORGES

THIBAUD, tē'bō', JACQUES (1880-). A French violinist, born at Bordeaux. He received his first instruction from his father and then entered the Paris Conservatoire, where he studied under Marsick and won the first prize in 1896. After his début at Paris in 1898, he made several very successful tours of Europe and visited the United States for the first time in 1903. In December, 1914, an American tour was suddenly interrupted by the death of his father, and after that he served a year in the French Army. The experiences through which he passed must have made an indelible impression on his mind and affected his whole conception of art. On his reappearance in 1916, he revealed a breadth of conception and an emotional intensity of which his previous performances had given no intimation. From a player of charming elegance and refinement he had, in an incredibly short time, grown into one of colossal power.

THIBAUDET, tē'bō'dā', ALBERT (1874-). A French literary critic, born at Tournus, Saône-et-Loire, and educated at the Sorbonne. After teaching in various lycées, he became professor of French literature at York, England, and then at Geneva. He was also literary critic for the *Nouvelle Revue française*, the *London Mercury*, the *Journal de Genève*, and the *Dagens Nyheter* (Stockholm). His studies on Barrès, Bergson, and the intellectual currents of the last generation in French letters were genuine and disci-

plined analyses of modern life. His works include: *La poésie de Stéphane Mallarmé; Les heures de l'Acropole; Trente ans de vie Française* (4 vols., 1920-23), consisting of *Les idées de Charles Maurras, La Vie de Maurice Barrès, and Le Bergsonisme* (2 vols.); *Gustave Flaubert. Paul Valéry* (1923); *Étranger; ou, Études de littérature anglaise* (1925); and *La république des professeurs* (1927).

THISELTON-DYER, SIR WILLIAM TURNER. See DYER, SIR WILLIAM TURNER THISELTON.

THOMAS, FREDERICK WILLIAM (1867-). A British Orientalist. He was educated at King Edward's School, Birmingham, and Trinity College, Cambridge, where he was a fellow (1892-98). He served as assistant librarian at India Office from 1898 to 1903. He was chairman of the board of comparative philology at the University of London, president of the Philological Society, and editor of *Epigraphia India* (1916-22). Since 1927 he has been Boden professor of Sanskrit at Oxford.

THOMAS, THE RT. HON. JAMES HENRY (1875-). An English Labor leader and public official, born at Newport, Monmouth. He started work as an errand boy when he was 9 years old, and later was engine cleaner, fireman, and engine driver for the Great Western Ry. Co. He became prominent in the labor unions and was president of the Amalgamated Society of Railway Servants, since merged in the National Union of Railway Men, in 1910, and general secretary (1918-24, and since 1925). He was elected to Parliament in 1910. He was made Privy Councillor in 1917, was president of the International Federation of Trade Unions (1920-24), a member of the General Council of the Trade Union Congress, and its chairman in 1920-21, and was Secretary of State for the Colonies in the Labor government of 1924. After its overthrow, he was active in the Opposition. In June, 1929, he became Lord Privy Seal and unofficially Minister for Employment in Ramsay MacDonald's second Labor cabinet. The latter post was created to deal with what was considered the most pressing problem facing the country. He received an honorary LL.D. from Cambridge (1920) and a D.C.L. from Oxford (1926). He wrote *When Labor Rules* (1920).

THOMAS, NORMAN MATTOON (1884-). An American Socialist Party leader. He was born at Marion, Ohio, and graduated from Princeton (1905). He completed his theological studies at Union Seminary, New York, and was ordained to the Presbyterian ministry in 1911 after one year's service as associate at the Brick Presbyterian Church. For seven years, he did pastoral work in New York City. He founded and was editor of the *World To-Morrow* (1918-21). In 1921-22 he was associate editor of the *Nation*. He was candidate on the Socialist ticket for Governor of New York in 1924, for Mayor of New York City in 1925 and 1929, and for President of the United States in 1928. He wrote *The Conscientious Objector in America* (1923); *The Challenge of War* (1925), *Is Conscience a Crime?* (1927); and *What is Industrial Democracy?* (1927).

THOMPSON, WILLIAM BOYCE (1869-). An American banker, born at Virginia City, Mont., and educated at the Columbia University School of Mines. Engaging in business in New York City, he became director and officer

in many important financial institutions. From its organization until 1919, he was a director of the Federal Reserve Bank in New York and he founded and endowed the Institute for Plant Research. He headed the American Red Cross Commission to Russia in 1917 and was Envoy Extraordinary from the United States to the first centennial of the Proclamation of Independence of the Republic of Peru. In 1921-22, he served as a member of the advisory committee of the American delegation at the Disarmament Conference.

THOMPSON, WILLIAM GILMAN (1856-1927). An American physician and educator, born in New York. He received a degree in science from the Sheffield Scientific School in 1877 and a medical degree from Columbia in 1881. After post-graduate study in London and Berlin, he returned to New York, teaching medicine at the Columbia University Medical College (1887-98) and at Cornell University Medical College (1889-16). He was also chairman of the industrial hygiene division of the New York State Labor Department. His standard works are *Practical Dietetics* (1909) and *Occupational Diseases* (1915).

THOMPSON, WILLIAM HALE (1869-). Mayor of Chicago. He was born at Boston, taken to Chicago as a child, and educated in the Chicago public schools. He spent five seasons on cattle ranches in Colorado, Montana, and Wyoming, and was manager of a ranch in Nebraska three years. During 1900-02 he served as alderman from the Second Ward of Chicago and then for two years was county commissioner of Cook County. He was Mayor of Chicago from 1915 to 1923 and in 1926 was elected for a third term, expiring 1931, as an opponent of alleged pro-British interests in the schools. He instigated the actions by the Board of Education which led to the resignation of William McAndrew as superintendent of schools in 1928. From 1916 to 1920, he was a member of the Republican National Committee.

THOMSON, SIR JOSEPH (JOHN) (1856-). A British physicist (see Vol. XXII). He resigned his professorship of experimental physics at Cambridge in 1918 and became master of Trinity College. From 1916 to 1920, he was president of the Royal Society. He was awarded the Franklin Medal and Scott Medal (Philadelphia) in 1923 and the Mascart Medal (Paris) in 1927. See **CHEMISTRY**.

THOMSON, SIR ST. CLAIR (1859-). A British surgeon. He was born at Londonderry and educated at King's College (London), and in Paris, Vienna, and Lausanne (M.D., 1891). He is emeritus professor of laryngology and consulting surgeon for diseases of the throat and nose at King's College Hospital, and consulting throat surgeon to the Italian Hospital and Throat and Ear Hospital, Maidstone. A fellow of King's College, he has been president of the Royal Society of medicine and of the Medical Society, and is an honorary member of numerous European medical societies. His works include *Diseases of the Nose and Throat* (3d ed., 1926), *The Cerebrospinal Fluid*, and *Shakespeare and Medicine*.

THOREK, MAX (1880-). An American surgeon, born in Hungary, who, having received his degree from Rush Medical College in 1904, settled in Chicago and for a time was connected with the medical department of Loyola University as professor of clinical surgery. He was later chosen president and surgical chief of the new American Hospital and is also one of the consulting surgeons of Cook County Hospital.

He has done considerable work in experimental surgery, has written numerous surgical papers, and in 1909 translated into English Krause's *Surgery of the Brain and Spinal Cord*. In 1924 appeared his large monograph, *The Human Testis*, in which are summed up all the developments in the grafting of the male gonad.

THORNDIKE, EDWARD LEE (1874-). An American educational psychologist (see Vol. XXII). He became in 1921 professor and director of psychology of the Institute of Educational Research. He published after 1914 numerous important monographs and papers on the application of mathematics to educational measurement, new editions of his standard two-volume work on *Educational Psychology*, *Psychology of Arithmetic* (1922); *Psychology of Algebra* (1923); and *The Measurement of Intelligence* (1926).

THRACE, thrās. Largely a transition land between the Turkish and Balkan peoples, without natural boundaries, and with mixed racial groups. Thrace, like Macedonia to the south, has been one of the storm-centres of the Balkans. The Treaty of Bucharest (1913) placed Greece, on the east, at the Mesta River. Between the Mesta and the Maritza, by the same treaty, Bulgaria acquired the region known as Western Thrace. East of the Maritza, including Adrianople and Kirk Kilissa, and stretching to the Straits, extended the region known as Eastern Thrace, which continued to remain in Turkish hands. Western Thrace, with a total population of 200,500, comprised 44,000 Greeks, 124,000 Turks, 29,500 Bulgars, 3000 others; Eastern Thrace, with a population of 805,309, was made up of 395,515 Greeks, 344,011 Turks, 67,843 Bulgars. For the realization of the Greater Greece, therefore, it was necessary to expand to the south and east to absorb these Greek populations and at the same time complete the encirclement of Constantinople, the barring of Bulgaria from the Aegean, and the shutting off of Turkey from its contacts with Europe. Thus, in the way of Greece stood Bulgaria and Turkey, and largely because these were allied with the Central Powers, was Venizelos convinced that Greece's lot had to be thrown in with the Entente. Bulgaria, of course, was not unaware of where her own interests lay. In 1915, as the price of her entry into the World War, she exacted from Turkey two important strips of territory, one being the Adrianople enclave, particularly Karaguchi, and the second the left bank of the Maritza, but with the Entente triumphant, the realization of Greek nationalistic hopes seemed assured. By the Treaty of Neuilly (Nov. 27, 1919), Bulgaria was compelled to cede Western Thrace to the Allies for Greece, and Greek sovereignty was circumscribed only in these three respects (1) Bulgarian freedom of transit of the Aegean was guaranteed; (2) the Maritza might be constituted an international river if Greece and Bulgaria requested it; (3) racial minorities, particularly at Adrianople, were to be protected. While the cession, territorially, was of no great importance—the region has only a length of 80 miles and an average depth of 30—and really left Bulgaria with a strategic boundary line, economically it meant Bulgarian disaster. Bulgaria was deprived of her front on the Aegean, of contact with the ports of Kavalla, Porto Lagos, Dedeagach—in short of the fruits of the First Balkan War—and compelled to be once again a Black Sea country. Bulgarians, in 1919, felt that they were

in the same position as they had been in 1911.

Here was the realization of one part of the Greek programme, but it was only a minor part, for Eastern Thrace was the section Venizelos, above all things, desired. Lloyd Geoghe had shown himself consistently friendly to the Greek aspirations. By gaining over the powerful British support, Venizelos saw his hopes crowned with success when in 1920 Greek troops received permission to occupy Eastern Thrace. By the Treaty of Sèvres (Aug. 10, 1920), the stamp of permanency seemed to be put on the proceedings, for Turkey was compelled to grant to Greece all of Eastern Thrace to the Chatralja lines (i.e., the western boundaries of the Zone of the Straits). Greece now not only had a firm foothold on the whole Aegean, possessing Adrianople and Kirk Kilissa, but also had an outlet on the Black Sea, but Venizelos fell in November, 1920, and with his passing the star of Greece entered into its decline. The fortunes of Greece in the years 1921-22 are reviewed elsewhere in this work. The destiny of Eastern Thrace depended upon the success or failure of the Greek arms, and with the Turkish Nationalist victory, Greeks were compelled to see their representatives renounce Eastern Thrace and Adrianople to the "Grand National Assembly of Turkey," by the Mudania Agreement of Oct 11, 1922, Turks immediately occupied the area up to the right bank of the Maritza. By the Treaty of Lausanne (July 24, 1923) Greece was completely humiliated. Not only was she compelled to part with Smyrna and the Dodecanese, but the whole of Eastern Thrace was taken from her to be turned back to Turkey. Greece's frontier stopped at the Maritza, with the exception of the Karagach district opposite Adrianople, Turkish sovereignty was once more proclaimed over Adrianople and Kirk Kilissa. For the prevention of boundary disorders, the Treaty of Lausanne, in an annex, provided for the demilitarization of a special area stretching from the Aegean between Makri and Imbrije Burnu to the Black Sea between Anberler and Serkes Burnu, and including the Greek, Bulgarian, and Turkish boundaries in Eastern Thrace.
